Welcome

Date :8/18/2000 Poster : Steve Ward

Welcome to our User's Discussion Forum. We are providing this forum as a means of information exchange for educational purposes. We are happy that so many of you are interested in sharing ideas about advanced ways to use our products. You are encouraged to share not only interesting techniques, but new and exciting applications of artificial intelligence. Thank you for your continued support of our products. Steve Ward, CEO.

End of day

Date :8/22/2000 Poster : Marco Racca

I am trying to have my trade closed at the end of day since I use only intraday data and daytrade the SP500, any help?

> ***Re: End of day***

Which addon should I get?

Date :8/24/2000 Poster : Maxwell Craven

I'm having a bit of difficulty understanding the addons, expecially the adaptive indicators and the neural indicators. I never used NeuroShell 2, but I have studied backprop somewhat, but these nets seem totally foreign to me. Can anybody help me out? Any ideas on how they can be used? Any thoughts on which I should purchase? Cheers!

> ***Re: Which addon should I get?***

>
> Fortunately, you don't have to understand the methods to use them. Here are what I believe to be the key characteristics:
>
> Adaptive Net Indicators - they do pattern recognition much like a human would. They actually compare new patterns to the training patterns. They are pretty good for classification.
>
> Neural Indicators - they have backprop architectures, but weights are found by genetic algorithm instead of backprop's gradient descent algorithm. The recurrent nets "look back" in the data. Most important to me, they don't predict anything; they just give buy/sell signals directly.
>
> Adaptive Turboprop 2 - Like the Prediction Wizard in the Trader, except capable of retraining automatically every N bars. Also, you can optimize outputs, just as with the other two types above. You can also optimize the training set size and the lookahead period.
>
> I haven't found any one addon better than the others. None work all the time for all issues. However, I especially like the recurrent Neural Indicators; I often just feed them open, high, low, close, and volume.

> ***Re: Which addon should I get?***
>
> Date :9/8/2000 Poster : tb
>
> Maxwell,
>
> You aren't the only one having trouble keeping up with all of the new Ward products, what they offer, and how they fit together. I have been using Neuroshell2 for years and just started using the Trader. My company utilizes neural nets in some of our trading programs, generally employing GRNN and PNN style nets as opposed to nets based on backprop. They handle sparse data sets, train very quickly, and lend themselves well to trading problems.
>
> The reason we started using the Trader is that Ward created "Adaptive Net Indicators", which is an add-on that essentially creates an indicator in a chart depicting the output of a GRNN or PNN network. The networks update themselves every bar, moving the training set forward one bar at a time so that the network is always up to date. It is very easy to set up trading strategies based on the value of the neural net "indicator", and we are able to export the indicator values to Trade Station 2000i if necessary.
>
> If you use the Adaptive Net Indicators, try the "classify" category of nets. All you have to do is choose a meaningful combination of price based indicators and the package will create an output ranging from 1 to -1, indicating market strength or weakness. Simple trading strategies that get long at values above a given thresh-hold (maybe .25 or higher) and flat when the indicator goes below zero work very well. Short sales would take place at a symmetric negative value and exit above zero.
>
> Good luck!
>

Calling a dll

Date :8/24/2000 Poster : chris wong

anybody used visual basic successfully to build indicators? i can't seem to get a vb dll working. have programmed a lot, but kind of new to vb and neuroshell. want to build several ideas i have into my chart.

> ***Re: Calling a dll***
>
> Date :8/29/2000 Poster : Ward.net Webmaster
>
> Visual Basic won't make DLLs . It makes something called an ActiveX DLL, but that is misleading, because it isn't the same as a regular DLL. You can use Microsoft C to build a DLL, but we find that the PowerBasic compiler is a lot easier to use. Take a look at www.powerbasic.com and also take a look at the PowerBasic code we have provided in the Trader examples section of this site.

Signal triggered on bar 1

Date :8/29/2000 Poster : Bruno Voisin

Hi,
Have you noticed that if an indicator, say RSI(10), is used to for instance trigger a signal, it will be enabled from bar 1 even though it requires 10 bars to be calculated properly. This may lead to wrong optimizations.
Some function equivalent to the EasyLanguage "MaxBarsBack" would eliminate such problem, I believe.

Your feedback would be much appreciated.

Bruno

>
> In the default chart formatting mode, the oldest data is not showing, so the RSI will be enabled from the first bar SHOWING on the chart. However, there can be many bars earlier than those on the chart that indicators can use for their "build up". In other words, you can have data that is loaded, but not necessarily displayed. The indicator will be calculated on what is loaded. Is this perhaps what you are noticing?

General advice on using N.Trader Pro

Date :9/1/2000 Poster : Ian

I have owned and worked with NT professional since its first release, on a part-time basis, and would be interested in feedback on the questions below. I know it's a long list….feedback on any aspect useful. I trade primarily commodities (mainly grains and bonds). Sorry this is so long.

Selection of instrument to study

1. I could do with more guidance on this item. For example it is often recommended to select data that is less influenced by fundamental forces, but stocks and commodities are all affected greatly by fundamental forces…what are the technical characteristics I should be looking for in deciding (e.g. is it the lack of a trend, or is it simply the maintenance of the same technical forces throughout the training and walk-forward periods? Or is it a broad range of both trends and non-trending periods?)

Preprocessing

1. Is it necessary to do any preprocessing when feeding data into Neuroshell trader? E.g.
   - In cases where one indicator may show a negative number for a buy and another a positive number for a buy, is it neccesary to make all 'buy' inputs point the same way?
   - How well do inputs with just a binary 1 or -1 value help? Might such an indicator (showing the overall, long-term trend for example) be useful in a system primarily using oscillators for short-term

Inputs

1. With indicators (e.g. RSI), is it enough just to feed in the indicator as is, or should I also feed in variations on it, e.g. the difference between today's and yesterday's value (to show direction), or difference between value and a certain constant (to show crossovers on a constant) etc. Does the adaptive turboprop do anything akin to these variations?
2. Related to 1 above, with the recurrent nets (add-in) is it less necessary to add lags of indicators since these nets retain some 'memory' of past values.
3. Did I read somewhere that binary inputs (e.g. 1 and 0, or 1 and -1 etc) are not well suited to neural nets like NT? Or is it only when the output is not binary as well?
4. Does it make sense to somehow sync the length of the output forecast with the length of the inputs? (i.e. if I am trying to forecast 5 days ahead, should I be looking for moving averages with 5,10, or 15 as the lengths? And RSI with length of 5 etc)
5. With all the advice on the website and doc about using the momentum and volume indicators, has anyone found other categories useful? (Not asking for any secrets here, just a prod in the right direction).

Training

1. Is it simply a matter of trial and error whether I go for multiple walk-forwards, optimize on training or walkforward sets etc? Is there an intelligent process I should go through to look for this?

Outputs

1. Is it worth exploring a binary output that gives a 1 for open in x periods ahead being higher than current period, and -1 for it being lower?
2. Is it possible to find the optimal output…e.g.to see how many days in advance I should be predicting? Jurik talks about an 'optimal forecast distance', that was the idea I had in mind.

Prediction Results, walk forwards etc.

1. I assume that to determine if I have a net that is potentially reliable enough to trade with I need to be looking for
- Consistency of results in training and walk-forward tests
- Good results in both sets of data

Am I correct?

Overall Approaches

1. Has it been found useful to just throw all indicators in the package at a chart, and let the full optimization just find out the best indicators and values? I realize this would take a lot of computer time…
2. Is it useful to first of all take 1 indicator on its own and try all sorts of training criteria, outputs etc and just see what the best result is that I can get, then go on to the next indicator and do the same, and eventually use this process to identify the best outputs and criteria before putting a whole slew of indicators in and letting the optimizer sort out the best combinations and values.

If you are still reading....Thanks!!!!

Re: General advice on using N.Trader Pro

Date :9/7/2000 Poster : Steve Ward

I'll respond to three of your questions that I feel have clear-cut answers. The others are part of the art and can be argued many ways, so I'll let some other users give their opinions on those.

>1. Is it necessary to do any preprocessing when feeding data into Neuroshell trader? E.g. In cases where one indicator may show a negative number for a buy and another a positive number for a buy, is it neccesary to make all 'buy' inputs point the same way?

No, not necessary.

>2. Related to 1 above, with the recurrent nets (add-in) is it less necessary to add lags of indicators since these nets retain some 'memory' of past values.

Yes, it is less necessary, unless you want to look back more than say 5-12 bars. The Lag indicators in Adaptive Net Indicators, however, can look back arbitrarily far.

>2. Is it possible to find the optimal output e.g.to see how many days in advance I should be predicting? Jurik talks about an 'optimal forecast distance', that was the idea I had in mind.

You can apply the optimizer to this task if you have one of the following addons: Adaptive Net Indicators or Adaptive Turboprop2. Both of those can optimize not only the output indicator parameters, but how far ahead the lookahead is.

Re: Re: General advice on using N.Trader Pro

S&P forcasting

Date :9/2/2000 Poster : John Crisp

Has anyone had any success foecasting the S&P index? I would like a few tips on how to do this.
Thanx
John

Re: S&P forcasting

Date :4/8/2001 9:12:35 AM Poster : NFred

I was successful until the break. Very difficult to design models that train on an uptrend and still work well in a downtrend.

Re: S&P forcasting

Date :4/9/2001 5:35:21 PM Poster : OmaSteak

Hello,
I've been able to do a weekly SPY buy/sell point forecast that has worked and continues to work pretty well. While I can't give you the specifics of my indicators, it involved an exponential moving average and a measure of the differential between the projected buy/sell point and the ema value. You can see the results posted at www.powerindexing.com.

S&P index prediction

Date :9/3/2000 Poster : John Crisp

Could someone please advise me on the data variable for the input and the indicators that I should be using. I am very new to this and would very much appreciate any help forwarded.
Thank you.
John Crisp

Re: S&P index prediction

Date :9/5/2000 Poster : Ian

Hi John,

I am no expert on this but have you looked into the most obvious?

1) the S&P examples contained in the product
2) the momentum and/or volume indicators (as mentioned in help
and on tips at the web site)
3) example in Gateley's book where he uses several other
data items (e.g. CRB index, treasury Bill index etc)
4) if you have NT Pro you can very quickly optimize and test whole
groups of indicators to get ideas (from the contribution factors) which
ones are likely to help you most

You need to have an idea of what you want to forecast (price changes
for example, not absolute prices) and the time frame....it will be a long
slog unles you have an idea that shows promise outside the neural net first.
Oh....and the training data needs to have similar characteristics as
the 'live' data.

Let me know if you would like to collaborate Ed:on this forum, please...as I say, I am no
expert, but two hands could be better than one. Ian

How about 3 hands? I would be interested in collaborating on a project in this forum. I found that one of the best things about the Ward Sessions in Florida was the sharing of ideas and techniques. It would be great if we could get that kind of exchange going here. It would REALLY be nice if we had some way to share files/charts..... (hint, hint)

Ed: please see the post concerning sharing files

John, Eric and anyone else who wants to take part...how about this as a proposal?

I think we need to work through the following items. Lets agree on question 1 first and then proceed. We could split the work between us if you like. I am sure Ward Systems will be watching and hopefully advising us on how best to proceed...

1. Choose a data instrument to analyze - I think we have chosen the
favorite, SP500, but does anyone have a preference to the SP500 futures or the actual SP500 Index? I have extensive histories of both, I can share them if needed.

2. Decide what target to predict and time period - e.g. percent change in close, simple up or down in x days (ie binary indicator), or a derivative indicator such as the direction of the average of the close etc. I am happy for us to concentrate on any or all of these...I have been particularly interested in the binary one, but am happy to look at any of them.

3. Decide on best inputs - I do have the NT Pro and therefore could use the optimizer to help us identify good ones. I also have an extensive range of indicators in Tradestation that I would like to add to the mix. I assume we are heading for a range of about 5 or 6 indicators that are not closely correlated, I think I also have some software that can help us mathematically measure correlations.

4. Decide on training parameters (i.e. how many and how long walk forwards, when to retrain etc).

5. Sell our holy grail for $5k a time - no just joking.....

6. I have many of the NT add-ons and would be happy to use any of those to add to the mix...

Thats all for now, if everyone is in agreement with these steps we should star
with 1 and 2 (2 might need some discussion)...Ian

Re: S&P index prediction

Date :9/12/2000 Poster : Ian

1. Choose a data instrument to analyze - I propose that we do the straight S&P500 index (symbol SPX), its easy to add others on later. Next stage is..

2. Decide what target to predict and time period - I will work on four main approaches, namely
i) try to use Jurik's optimal forecast horizon to assess how far in the
future to predict (and pick something like percent change in close), either
creating this OFH in Tradestation and feed it through to NT or try to create it in
NT...
ii) use the various add-ins (e.g. Adaptive Net Indicators) to optimise the output period
iii) create a binary (i.e. buy or sell) output, or maybe this is really the
trading strategy rather than the target output. (comments?)
iv) use a good old favorite, namely 5 days percent change in close

I will create 4 separate charts.

This will keep me busy for several days, after which I will report back on this thread and then we can move onto the indicators/prediction inputs.

Does anyone have any alternative suggestions, or other lines they would like to follow up?

Ian.

Re: Re: S&P index prediction

Date :9/27/2000 Poster : Justin

Word of caution:

Be sure that the data you are going to use is virtually error free, this can be a daunting task. Before using any data files in Trader I check the data against a minimum of two other sources to ensure its integrity.

I have first hand experience with data files from a commonly used eod provider being inaccurate on many occasions, in many markets.

Re: Re: Re: S&P index prediction

Date :10/1/2000 Poster : Michael

I spoke with Steve Ward last year, and he suggested using the % change in Open, rather than close. I tried a few nets either way, and the open price seems to give a better predictor in volatile markets.

You're planning to give a binary output for trading. Two thoughts on binary versus analog output. 1) neural nets don't generalize well when forced to yes/no, true/false answers or predictions. We live in an analog world. 2) It will be extremely difficult to compare the possible returns between two alternatives with a binary number. If we predict % change in close, then we'd like to move into the investment which has the most % change. I suggest that a comparison tool between alternatives be the goal, rather than a binary yes/no.

Re: Re: Re: Re: S&P index prediction

Date :10/4/2000 Poster : JM

I agree with Michael. I've tried many months using binary output and the result has been very disappointing.
Generally, my experience with NST is that it is better suited to predicting an analog output. Why not try
predicting some good indicator values, esp oscillators, that will have a positive impact on our trading rather than predicting
price itself?

Hi,

I would like to say I'm in but I do not trade US markets.

I'm interested to know more about point 2(i) below regarding Jurik's OFH. Is it an addin? Can it be created in NT Pro from scratch? I've read about it and would like to find out more about it.

Thanks, KC

On 9/12/00 Ian wrote:
1. Choose a data instrument to analyze - I propose that we do the straight S&P500 index (symbol SPX), its easy to add others on later. Next stage is..

2. Decide what target to predict and time period - I will work on four main approaches, namely
i) try to use Jurik's optimal forecast horizon to assess how far in the
future to predict (and pick something like percent change in close), either
creating this OFH in Tradestation and feed it through to NT or try to create it in
NT...
ii) use the various add-ins (e.g. Adaptive Net Indicators) to optimise the output period
iii) create a binary (i.e. buy or sell) output, or maybe this is really the
trading strategy rather than the target output. (comments?)
iv) use a good old favorite, namely 5 days percent change in close

I will create 4 separate charts.

This will keep me busy for several days, after which I will report back on this thread and then we can move onto the indicators/prediction inputs.

Does anyone have any alternative suggestions, or other lines they would like to follow up?

Ian.

Try www.jurikres.com , that is the Jurik Research website.

I have tried to contact him in effort to explore him writing some of his indicators for use in NT Pro. I have not heard back. I own some of his indicators for Tradestation, but I do not get the benefit of optimizing with the GA.

Maybe if others express an interest to him as well it would help. The indicators are fantastic.

Hi Justin,

I think the only useful product by Jurik Research is JMA (Jurik's Moving Average). They have implemented this as a DLL and it can be used as a AddOn to Trader.

I do not find the rest of their products like CFB and WAV useful.

Best Regards
-Victor Chu

Victor,

I appreciate your thoughts and opinions. JMA, and RSX, can be great indicators.

How would I go about using JMA as an add-on? I have no experience with DLL's.

Would I get full use of the GA optimization using JMA in this way?

Thank you,
Justin

Hi Justin,

I have implemented Mark Jurik's JMA as a DLL. It is pretty good but to get the full advantage of any tools, first try to understand how to implement them. For example, if you create a MACD using a JMA for the fast curve and a simple moving average for the slow curve you will get a better MACD than the traditional ones because in this type of indicator you want to take full advantage of lag and JMA will allow you to do this.

To call the DLL via your own code (assume c or c++) is very easy.

You can optimise settings used in JMA using the genetic algorithms in DTPro although you will want to understand more about the outputs you are seeking first.

Best regards,

Daniel

Justin,

you need to purchase JMA as a DLL from Mark Jurik at:

www.jurikres.com

To call the DLL from NST, you will need to place the jrs_32.dll in the template directory and use the array method to create the template in NST.

You can also write your own DLL that calls JMA as part of a more complex indicator.

I hope this helps,

kind regards,

Daniel

Maybe we can clarify. By "array method", Daniel Lyons means the indicator "External DLL Call by Array", which is in the "External DLL Calls" category. You give this indicator the DLL's calling parameter types and default values, and then the Trader Professional makes a custom indicator that makes calling the DLL possible. The custom indicator is stored as a .tpl file in the Template Folder of the Trader folder. You can even specify a category you want the custom indicator to show up under. You are allowed to share your .tpl files with others as you wish, just as you can share charts. This is the method by which all of our add-on vendors supply their indicators to users in DLL form.

I will create 4 separate charts.

This will keep me busy for several days, after which I will report back on this thread and then we can move onto the indicators/prediction inputs.

Does anyone have any alternative suggestions, or other lines they would like to follow up?

Ian.

IS THERE ANY POSSIBILTY YOU (OR ANYONE ELSE) WOULD CONSIDER SHARING YOUR .TPL FILES FOR JMA AND RSX?

On 10/31/00 9:35:58 AM Daniel P Lyons wrote:
Hi Justin,

I have implemented Mark Jurik's JMA as a DLL. It is pretty good but to get the full advantage of any tools, first try to understand how to implement them. For example, if you create a MACD using a JMA for the fast curve and a simple moving average for the slow curve you will get a better MACD than the traditional ones because in this type of indicator you want to take full advantage of lag and JMA will allow you to do this.

To call the DLL via your own code (assume c or c++) is very easy.

You can optimise settings used in JMA using the genetic algorithms in DTPro although you will want to understand more about the outputs you are seeking first.

Best regards,

Daniel

Victor,

I appreciate your thoughts and opinions. JMA, and RSX, can be great indicators.

How would I go about using JMA as an add-on? I have no experience with DLL's.

Would I get full use of the GA optimization using JMA in this way?

Thank you,
Justin

On 10/27/00 Victor Chu wrote:
Hi Justin,

I think the only useful product by Jurik Research is JMA (Jurik's Moving Average). They have implemented this as a DLL and it can be used as a AddOn to Trader.

I do not find the rest of their products like CFB and WAV useful.

Best Regards

Hi Troy,

I am not sure if you call RSX from NS Trader since Jurik has not implemented as a DLL, but I can certainly share my TPL file for JMA.

I wonder if Daniel has used JMA to smooth any indicator other than MACD with success.

Thanks
Victor Chu

Re: Re: Re: Re: S&P index prediction

Date :9/12/2000 Poster : Eric

Ok, here are my thoughts:

1. The SP500 is fine with me. I would lean towards the Index instead of the Futures, just to avoid the "expiring contract" issue, but I can't say that I really care that much.

2. On the issue of what to forecast, I've always felt that was a tricky question. I've thought a lot about, but I can't say I have any good answers. I was never real happy with "%change over a period of time". I've always wanted to capture sustained moves and simple percentages don't always do that. The path that Stock X took to gain 10% in 20 days I think is important. Was it up 5% in 10 days or down 50%. You can use derivatives to get around a lot of that, but I've never been real happy with thoes results either. I can eyeball a chart and say where I'd like to buy and sell, but I'm not sure how to quantitatively model that... I one time tried optimizing a trading strategy, giving it the future values and adjusting the trading costs to see what it gave me as buy and sell points, but once again, no holly grail. I guess this is a long way of saying "I don't know." I would like to know your thoughts on the binary indicator and what you're looking for the model to predict.

3. I'm working with NDT(?) Pro, the day trader version, with Tradestation, which I bought 1 month before Omega announced they were "changing" to a web site version..... (I'm not real happy with Omega, but I'll hold judgement until I see what they release.) But as far as NT is concerned, I can work with either the intraday or the end of day depending on what everyone else has.

4. I'll leave the training parameters alone for now, but I think that deserves a lot of discussion.

So that's my 2 cents. Let me know what you think about #2.

-Eric

On 9/10/00 Ian wrote:
John, Eric and anyone else who wants to take part...how about this as a proposal?

I think we need to work through the following items. Lets agree on question 1 first and then proceed. We could split the work between us if you like. I am sure Ward Systems will be watching and hopefully advising us on how best to proceed...

1. Choose a data instrument to analyze - I think we have chosen the
favorite, SP500, but does anyone have a preference to the SP500 futures or the actual SP500 Index? I have extensive histories of both, I can share them if needed.

2. Decide what target to predict and time period - e.g. percent change in close, simple up or down in x days (ie binary indicator), or a derivative indicator such as the direction of the average of the close etc. I am happy for us to concentrate on any or all of these...I have been particularly interested in the binary one, but am happy to look at any of them.

3. Decide on best inputs - I do have the NT Pro and therefore could use the optimizer to help us identify good ones. I also have an extensive range of indicators in Tradestation that I would like to add to the mix. I assume we are heading for a range of about 5 or 6 indicators that are not closely correlated, I think I also have some software that can help us mathematically measure correlations.

4. Decide on training parameters (i.e. how many and how long walk forwards, when to retrain etc).

5. Sell our holy grail for $5k a time - no just joking.....

6. I have many of the NT add-ons and would be happy to use any of those to add to the mix...

Thats all for now, if everyone is in agreement with these steps we should star
with 1 and 2 (2 might need some discussion)...Ian

Eric,

In answer to your question..

>> I would like to know your thoughts on the binary indicator and what you're looking for the model to predict.

my answer is that I have wanted to research first setting up indicators at the
'ideal' tops and bottoms (maybe by using a zig-zag indicator), and then see if there are
are a good combination of indicators that predict those points well. I am sure
many have tried that before, but I guess I have to learn for myself! Also, I
realise the zig-zag indicator cannot be used realtime, but I just want to use it
for training the net. Meanwhile, I am setting up all the other parameters
mentioned in previous posts and I will be in touch. Ian.

Re: Re: S&P index prediction

Date :9/15/2000 Poster : Olli

May I join in?

Finding out what to predict seems to be one othe most important keys to success in predicting. I have found out, that this depends on the market, the behaviour of which you are trying to predict. The percent change works fairly well in currencies, where trends tend to be longish, but not that well with the SP500 or any other more fluctuating market. So my idea is that you would need to have to compile something, which
1) would tell you the direction and give an estimate of
2) the magnitude of the expected move and which would
3) not lag the market too much, otherwise you are trying to predict the past or the present movements, not the future.

The real outcome of trades is of course most dependant on your exit strategies, but I would be grateful of finding better entries as well.

Any thoughts?

Finding out what to predict

Date :9/20/2000 Poster : Steve Ward

I couldn't agree with Olli more. Here is a very typical comment we've received through the years: "I have just changed my output and now I'm getting great results." We've heard this in scientific applications as well as financial. Remember that neural net outputs do no have to be just price, change in price, or percent change. You can predict any standard indicator or one you custom build. One idea to get you started is already posted on this site under tips and techniques called Normalizing Network Outputs.

Thanks to Olli and Steve for the ideas, I will be working on some
output ideas this weekend, including the Ruggiero example referred to.
I thought I would first take a simple net and keep the input the same
try the different outputs to see what happens....for me at least this
is already a very useful forum. I will send the results of my work
back to the forum in the next 4 days or so. Ian.

John:

As an alternate to modeling the S&P500 index you might consider SPY ADR's traded on the AMEX. They have enormous liquidity as they are one of the most actively traded issues on the
the exchange. I have had good success modling it (over an out of sample of the last 2 years) by using Predict4 AdaptiveNet Add In Not Turbo Prop 2) . just using the
Open, High, Low, Close. However, I have not traded it, but will follow the signals for a while.

Good Luck,

Tom Gamon

Someone check me if I'm wrong, but ADR stands for American Depository Receipt, a vehicle used most often for trading share(s) of foreign companies on an American Exchange. However, the SPY are actually more similar to a tradeable mutual fund that has been created to mimic an index. The SPY is supposed to track the S&P 500, while DIA (Diamonds) should track the Dow Jones Industrial. There are a lot more, but you get the point. They are traded throughout the day on the Amex, and I don't believe they're subject to the up-tick rule for short sales. You can read more about them at www.amex.com. Look under "Index Shares" and then again under "Broad based Indexes". I don't know if they trade futures on them, however, I would be very surprised, since you can trade futures on the underlying index they're supposed to track.

Again I'm not an expert, but generally, the uptick rule says that if you are going to sell a security short, the trade must be conducted at a price above the previous price (an uptick) or at the same price. However, the trade can only be conducted at the same price if the previous price was itself an uptick. It's designed to prevent short sellers from driving down the market. There are other rules for NASDAQ, where you are dealing with Market Makers, but the intent is the same. I did a quick search on Yahoo and found this explanation if you want more specifics: http://www.directaccesstrader.com/short.htm. Good luck.

DayTrader Pro - question about misprints

Date :9/5/2000 Poster : Jimmy Raineri

I just started using DT Pro. It's a great package. I have a few questions, but let's take one at a time:

1. How does it handle misprints? It seems to me that quote.com only sends corrections (cancels) - and I noticed today that DT Pro didn't adjust the corresponding bar properly. For example, during a 2 minute bar the low price was 10.00 and the high was 20.00. 2 minutes later a cancel is made for the only trade at 20.00 and it is resubmitted at 15.00 - leaving the high trade for the previous 2 minute bar at 12.00. DT Pro still shows 20.00 for that bar, and I assume it trains and optimizes based on that incorrect price.

That leads me to a general question about misprints - is there any way within DT Pro that I can "see" these misprints and create an indicator based on them? It seems obvious that these "mistakes" are made to manipulate the price of a stock.

Thanks.

Re: DayTrader Pro - question about misprints

Date :9/5/2000 Poster : Jimmy Raineri

A little typo above - resubmitted at 12.00 - not 15. <G>

Re: Re: DayTrader Pro - question about misprints

Date :9/12/2000 Poster : Ward.net Webmaster

We'll look into whether the cancels that you see on Qcharts are coming into our feed too, and whether they can be handled. In the mean time, you can manually correct any data point in the Trader. Please look in the videos in the section called Formatting a Chart, and the video is called Modifying Raw Data. This technique works with the DayTrader as well as the other versions.

Re: Re: DayTrader Pro - question about misprints

Date :9/12/2000 Poster : Ward.net Webmaster

Our programmers now tell us that NeuroShell DayTrader Professional is indeed programmed to correct the chart when quote.com sends corrections. This may appear not to be the case, however, because:

1. The DayTrader doesn't make the bad part of the bar turn red like Ocharts does.
2. Different servers have slightly different data. If NeuroShell DayTrader Professional is connected to a different server than QCharts, there is a good chance that the data will vary between the two programs (Open, High, Low, Close, and Volume have been observed to be different).

If you can capture evidence that data correction isn't working, we'd like to see it. Please forward details to support@wardsystems.com.

With regard to building an indicator, it is not possible at this time, but it will be added to our ideas list.

On 9/5/00 Jimmy Raineri wrote:
A little typo above - resubmitted at 12.00 - not 15. <G>

On 9/5/00 Jimmy Raineri wrote:
I just started using DT Pro. It's a great package. I have a few questions, but let's take one at a time:

1. How does it handle misprints? It seems to me that quote.com only sends corrections (cancels) - and I noticed today that DT Pro didn't adjust the corresponding bar properly. For example, during a 2 minute bar the low price was 10.00 and the high was 20.00. 2 minutes later a cancel is made for the only trade at 20.00 and it is resubmitted at 15.00 - leaving the high trade for the previous 2 minute bar at 12.00. DT Pro still shows 20.00 for that bar, and I assume it trains and optimizes based on that incorrect price.

That leads me to a general question about misprints - is there any way within DT Pro that I can "see" these misprints and create an indicator based on them? It seems obvious that these "mistakes" are made to manipulate the price of a stock.

Thanks.

Fuzzy Logic and Neural nets

Date :9/5/2000 Poster : Ian

I am interested in opinions as to whether I can create systems within
NT pro (incl add-ins) that cover fuzzy logic approach? or if indeed anyone feel that is worthwhile to explore.

Thanks. Ian.

Re: Fuzzy Logic and Neural nets

Date :9/7/2000 Poster : Bruno VOISIN

In my view, neural nets are also good fuzzy logic operators. I would use Kohonens (unsupervised learning) or Probabilistic nets (supervised learning) to do classification, the way a fuzzy logic preprocessor would. I don't know of any FL add-on for NSTrader though.

Ian,
The discussion can go much further. It is always funny to send a message to the FL newsgroup and tell them that everything FL does can be done by neural nets. You can expect some interesting backfire.
To my (modest) knowledge though, almost everything can be done using classification nets, and you may be better off buying the Ward add-ons, than using NeuroShell 2.

FL however may give you a more targeted approach (based on fuzzy rules), hence tends to give more productive results, a little quicker. You may want to take a look at some FL products. I would myself stick to the Trader and try to add on to the existing platform.

I agree with Bruno that neural nets contain all the fuzziness you need. Note that NeuroShell 2 nets can be called from the Trader Pro or DayTrader. However, if someone really wants to build a fuzzy logic engine in a DLL or our DataX add-on, wouldn't that be a nice add-on they could sell? For those that own GeneHunter, there's a great (but complicated and undocumented) Fuzzy Logic example on ward.net.

Hi Steve,

I do own Genehunter (it will be in your records!)...but cannot find the disks with
the serial #...so I cannot immediately access that example, could that be put in the file sharing area? Or could someone outline the main aspects of that example? Also...can the same be achieved with the NT Pro optimising capability? Ian

The GeneHunter Fuzzy Logic Example

Date :9/13/2000 Poster : Steve Ward

Ian:

We'll handle the serial number problem thru tech support channels. I don't know offhand why you couldn't use the Trader GA by coding the fuzzy engine in a DLL, but I'd do a little test first if I were you. Meanwhile, here is all the documentation we made:

Solving Fuzzy Logic Problems Using GA-generated Fuzzy Membership Function Parameters

It is possible to solve problems using fuzzy logic, even if you don't know the proper shape of the fuzzy membership functions (triangles or trapezoids). You can let the genetic algorithm find an optimal set of fuzzy regions (i.e., the membership triangles). You can download two Excel examples of this below. We have actually programmed the fuzzy logic "engine" into Excel, then used the GA to find the optimal membership trianges.

The first example, fuga_ln.xls, is a fuzzy logic example which seeks to approximate a parabolic shape, just as a neural network might do. The example is a fuzzy logic engine that takes an x value and generates the function value y=1.6x^2 - .8. The GA optimizes the form of the membership triangles to achieve the best approximation. (Obviously, the NeuroShell Predictor can do a much better job of such an approximation, but this is just an example.)

In the second example, fuga_3d.xls, we built a fuzzy approximator of the function z(x,y)=.5(x+y).

WARNING: These examples are very, very, difficult to understand and we have not documented them. They are beyond the capabilities of most of our users. Do not even attempt to understand them unless you are very good at Excel and you understand fuzzy logic. We offer them AS IS, with NO TECHNICAL SUPPORT, for anyone interested in building hybrid GA-fuzzy systems. The hardest part about them is understanding how we have built the fuzzy "engine".

Hi Steve,

I do own Genehunter (it will be in your records!)...but cannot find the disks with

For those wishing to code DLLs in Delphi, take a look at the example we have put on this site in the New and Updated Examples section.

Sharing Files on the Forum

Date :9/8/2000 Poster : Ward.net Webmaster

For those of you who would like to share your charts, indicators, etc with the rest of the forum, we have set up some procedures for doing so:

1. Create an archive file, either zip or exe, which contains all relevant files, including *.cht, *.tpl, *.dll along with any necessary data files. Please try to make your file as small as possible.

2. Send your archive file as an attachment to forum@ward.net

3. After review, we will upload your file to our server.

4. Within the body of your post to this forum, make a note indicating that you have sent a file to us. We will then insert a link to your file, so that others may download it.

Please only send example files and NOT problem files. If you have problems with your charts, please send those to support@wardsystems.com. We would like to keep this forum as a means for users to share ideas and not for tech support.

Re-Optomising and Re-Training

Date :9/10/2000 Poster : Nick Ali

Is there any way of preventing certian parameters being re-trained or even giving uper an lower bounds. If you have a system based on say a couple of nets do you have to go into each net and re-optomise and train?

Many thanks
Nick

Re: Re-Optomising and Re-Training

Date :9/12/2000 Poster : Bruno VOISIN

Any parameter range can be set prior to optimising. You may set the parameter range to nil (i.e. lower bound = upper bound) to prevent the genetic optimiser from "touching" it.

Bruno

Optimizing Trading Strategy

Date :10/5/2000 Poster : kc yeong

Hi all!

I've just got Neuroshell Trader Pro recently and found it to be a very flexible software. I have used Metastock before that.

As I was using the trading strategy wizard, I've got some results that I do not understand. Thought I'd post it here and hopefully, someone may have an answer.

It concerns the trading rule selection option. My objective is to optimize a simple moving average system. So, I ran the wizard with a range of parameters (5 to 100 in steps of 5) and ask the wizard to select one rule for simple moving average crossover above and one below. And I set the wizard to buy or sell when _one_ of the conditions is true.

Funny thing is that after optimizing, the software returned more than one buy conditions. Now, this confuses me. If I choose one buy condition, why does it return multiple conditions? In this case, the trading statistics will be calculated based on these multiple buying rules, true?

Any ideas?

Regards, KC

Re: Optimizing Trading Strategy

Date :10/6/2000 Poster : Ward.net Webmaster

When you choose one buy condition, you are saying that if any one of the many conditions is true, then buy. If you selected full optimization, then the genetic algorithm may delete some of the conditions, but it could still leave several there. Remember, it will buy when any one of those left is true.

If you really want only one rule possible, enter it and then do parameter optimization to find the best parameters for that one rule. Does this explanation help?

Re-optimising doesn't re-optimising

Date :10/6/2000 Poster : Paul Fowkes

I have a chart which uses two data streams in a strategy (ie it's non-neural, no prediction) to issue buy/sell orders for day trading SP. I created a chart from scratch and got some good results after optimisation (parameter) on the long-side but had mis-typed one of the short-side parameters.

I then updated my short-side parameters and can not get the thing to re-optimise at all. It simply ends up with the same trading stats that it starts with - even after running for half-an-hour (PIII 800MHz). I've tried everything I can hink of (changing parameter ranges, deleting re-adding them etc) but it never changes the results. They're always the same as it started with. Any ideas what I'm doing wrong?

I have built many other strategies/predictions etc and never seen this behaviour before. Normally if a change something and then re-optimise, the results change as you watch it run and you end up with something different. Help.

Re: Re-optimising doesn't re-optimising

Date :10/11/2000 Poster : chris wong

you indicate that the re-optimization was running for a half hour. maybe it was trying to find another solution but just kept coming up with the same one? i'm no expert on this, but maybe the optimal solution was the same for both sets of short side parameters you used?

On 10/6/00 Paul Fowkes wrote:

How to detect the NN optimal model

Date :10/6/2000 Poster : Peter Hoon

Here are some ideas for traders seeking to detect the optimal model, and avoid over fitting in NT.

Basically, the strategy is to test the model varying the number of hidden neurons you use, while you keep a table of statistical quantities, which are printed out in "Prediction Analysis".

Background

I have developed my own forward leading smoothed target, based on domain experience and graphical analysis, about 4 periods ahead, and am seeking to develop an optimal model to predict it.

Using GA, trial and error, and visual graphics, I came up with a prediction model for it that has good "fit stats". I selected "no trades" while building my model. I am just working on model building at this time; later, I will build a trading system around this "leading indicator", designed to pick intermediate tops and bottoms.

These data are based on an out of sample of over 1600 bars, made up of the OOS evaluation portions of three walk forwards. The training and each walk forward produced virtually identical fit stats for this model, a very encouraging sign that the model is robust.

The columns listed are consecutively: number of hidden neurons in training and optimization (always kept the same), the average error, the r, the R sqd, MSE (mean squared error), and percent correct sign. The second row is the % contribution respectively of three indicators: RMI(close, 3, 7), Williams %R(High, Low, Close, 8) and Waveletvaldaub12(close, 8, 2). The parameters for these inputs remain the same for each different number of hidden neuron models when optimization for parameter input is chosen (keeping all the inputs).

I get the same numbers below when I choose different objectives: Max R sqd, Min MSE, Max r. This also is an encouraging sign that the model is robust.

I get virtually the same numbers below when I check "balance upward and downward trending market sections".

<pre>

Hidden Avg Error r Rsqd MSE %correct sign (%contrib.) (%contrib.) (%contrib)
Neurons

0 11.4 .818 .669 192.0 100 (47.57) (47.26) (5.16)
3 11.4 .818 .668 192.2 100 (79.39) (16.68) (3.93)
6 11.4 .818 .669 192.0 100 (59.62) (37.96) (2.42)
7 11.4 .818 .669 191.9 100 (52.97) (40.81) (6.22)
8 11.4 .818 .669 192.1 100 (53.01) (41.66) (5.33)
9 11.4 .818 .668 192.2 100 (51.98) (43.19) (4.84)
12 11.4 .817 .667 193.2 100 (55.0) (40.13) (4.80)
15 11.4 .816 .665 194.1 100 (61.26) (34.46) (4.28)
20 11.4 .815 .663 195.1 100 (60.16) (36.24) (3.61)
25 11.5 .814 .662 195.9 100 (56.16) (41.17) (2.67)
35 11.5 .814 .661 196.5 100 (45.77) (45.10) (9.12)

</pre>

I'll number my statements about the data above, so traders can offer their ideas and reactions:

1) A completely linear model works well, but introducing some non-linearity by adding a few hidden neurons seems to help. Note the slightly lower MSE with 7 neurons Vs. Zero neurons.

2) The best clues to possible over fitting and possible model instability come by examining the Rsqd and MSE columns.

3) The use of 7 hidden neurons seems about optimal. You get a fairly nice spread of relative contributions, the highest Mul R sqd, and the lowest MSE.

4) After about 7 hidden neurons, the MSE starts rising, Mul Rsqd starts dropping, suggesting over fitting and possible model instability. Also, the relative contributions are not as evenly spread (RMI starts "hogging" more relative contribution) after the model with 7 hidden neurons, particularly with 20 and 25 neurons.

5) The model with 35 hidden neurons is either approaching instability, or actually is unstable: Note the unexpectedly high contribution of wavelet, and the higher value of MSE.

6) When I remove the input with the smallest contribution, wavelet, the model still works well and has good fit stats. However, keeping the input, which provides some information about cyclicity in the target, seems intuitively a good idea. The other two main contributors are principally measures of market momentum. Wavelet's presence in the model helps "spread" the relative contributions somewhat more evenly.

7) From breast cancer research using multivariate linear models, we often kept one predictor that had a relatively low contribution; it helped stabilize the model by acting as a "suppressor" variable, and it was often just at or slightly above the "F to enter or remove" level of statistical significance. Though it alone was not particularly important, we kept it because it slightly improved the overall prediction power of the model. This would be another argument for keeping wavelet in the model.

Re: How to detect the NN optimal model

Date :10/7/2000 Poster : Bruno VOISIN

Hello Peter,
Interesting exercise you have done. The 100% correct sign worries me a little though.

Talking about wavelets, I have tried to use them on several occasions without much tangible success. Much of the signal remains in the residual, implying that the signal is not well captured by the waves. Some wavelet functions may be more appropriate as most of the common ones are simple not suitable for time series. In addition, I believe you should detrend your series rather than using the close.

If you are interested in the topic, you may want to take a look at Prof. Murtagh's work on www.multiresolution.com. His paper is available on http://strule.cs.qub.ac.uk/~gzheng/financial-engineering/finpapermay99.html
And I have also re-writen his VB program for faster computations. The original code is available on his site (http://www.multiresolution.com/MTv2open.zip)

One question still: what financial issue are you trying to predict?

On 10/6/00 Peter Hoon wrote:

Re: Re: How to detect the NN optimal model

Date :10/11/2000 Poster : Maxwell Craven

It doesn't look like he used the close, although his "forward leading smoothed target" could be based on the close. Peter, can you tell us what your forward leading smoothed target was? The 100% correct sign most likely appropriate, because since the target is probably always large and positive, the prediction is probably always positive as well.

Using GA, trial and error, and visual graphics, I came up with a prediction model for it that has good "fit stats". I selected "no trades" while building my model. I am just working on model building at this time; later, I will build a trading system around this "leading indicator", designed to pick intermediate tops and bottoms.

These data are based on an out of sample of over 1600 bars, made up of the OOS evaluation portions of three walk forwards. The training and each walk forward produced virtually identical fit stats for this model, a very encouraging sign that the model is robust.

The columns listed are consecutively: number of hidden neurons in training and optimization (always kept the same), the average error, the r, the R sqd, MSE (mean squared error), and percent correct sign. The second row is the % contribution respectively of three indicators: RMI(close, 3, 7), Williams %R(High, Low, Close, 8) and Waveletvaldaub12(close, 8, 2). The parameters for these inputs remain the same for each different number of hidden neuron models when optimization for parameter input is chosen (keeping all the inputs).

I get the same numbers below when I choose different objectives: Max R sqd, Min MSE, Max r. This also is an encouraging sign that the model is robust.

I get virtually the same numbers below when I check "balance upward and downward trending market sections".

<pre>

Hidden Avg Error r Rsqd MSE %correct sign (%contrib.) (%contrib.) (%contrib)
Neurons

0 11.4 .818 .669 192.0 100 (47.57) (47.26) (5.16)
3 11.4 .818 .668 192.2 100 (79.39) (16.68) (3.93)
6 11.4 .818 .669 192.0 100 (59.62) (37.96) (2.42)
7 11.4 .818 .669 191.9 100 (52.97) (40.81) (6.22)
8 11.4 .818 .669 192.1 100 (53.01) (41.66) (5.33)
9 11.4 .818 .668 192.2 100 (51.98) (43.19) (4.84)
12 11.4 .817 .667 193.2 100 (55.0) (40.13) (4.80)
15 11.4 .816 .665 194.1 100 (61.26) (34.46) (4.28)
20 11.4 .815 .663 195.1 100 (60.16) (36.24) (3.61)
25 11.5 .814 .662 195.9 100 (56.16) (41.17) (2.67)
35 11.5 .814 .661 196.5 100 (45.77) (45.10) (9.12)

</pre>

I'll number my statements about the data above, so traders can offer their ideas and reactions:

1) A completely linear model works well, but introducing some non-linearity by adding a few hidden neurons seems to help. Note the slightly lower MSE with 7 neurons Vs. Zero neurons.

2) The best clues to possible over fitting and possible model instability come by examining the Rsqd and MSE columns.

3) The use of 7 hidden neurons seems about optimal. You get a fairly nice spread of relative contributions, the highest Mul R sqd, and the lowest MSE.

4) After about 7 hidden neurons, the MSE starts rising, Mul Rsqd starts dropping, suggesting over fitting and possible model instability. Also, the relative contributions are not as evenly spread (RMI starts "hogging" more relative contribution) after the model with 7 hidden neurons, particularly with 20 and 25 neurons.

5) The model with 35 hidden neurons is either approaching instability, or actually is unstable: Note the unexpectedly high contribution of wavelet, and the higher value of MSE.

6) When I remove the input with the smallest contribution, wavelet, the model still works well and has good fit stats. However, keeping the input, which provides some information about cyclicity in the target, seems intuitively a good idea. The other two main contributors are principally measures of market momentum. Wavelet's presence in the model helps "spread" the relative contributions somewhat more evenly.

7) From breast cancer research using multivariate linear models, we often kept one predictor that had a relatively low contribution; it helped stabilize the model by acting as a "suppressor" variable, and it was often just at or slightly above the "F to enter or remove" level of statistical significance. Though it alone was not particularly important, we kept it because it slightly improved the overall prediction power of the model. This would be another argument for keeping wavelet in the model.

Hi Bruno,

I've seen articles referring to Morlet wavelets as suitable for financial time series forecasting. They also mentioned that other wavelets are less suitable. In Prof. Murtagh's work, he used A'trous (spelled correctly??) wavelets. Can you tell me what is the difference between Morlet and A wavelet and how they are useful to financial time series forecasting compared to others?

Regards, KC

On 10/7/00 Bruno VOISIN wrote:
Hello Peter,
Interesting exercise you have done. The 100% correct sign worries me a little though.

Talking about wavelets, I have tried to use them on several occasions without much tangible success. Much of the signal remains in the residual, implying that the signal is not well captured by the waves. Some wavelet functions may be more appropriate as most of the common ones are simple not suitable for time series. In addition, I believe you should detrend your series rather than using the close.

If you are interested in the topic, you may want to take a look at Prof. Murtagh's work on www.multiresolution.com. His paper is available on http://strule.cs.qub.ac.uk/~gzheng/financial-engineering/finpapermay99.html
And I have also re-writen his VB program for faster computations. The original code is available on his site (http://www.multiresolution.com/MTv2open.zip)

One question still: what financial issue are you trying to predict?

Re: Re: Re: How to detect the NN optimal model

Hi KC,

I do not find the Morlet and Gabor wavelet really usefully as they suffer
from end point distortion. If they are used as inputs to a neural network the predictions
in the middle of the charts are beautiful but future predictions on the right of the chart
are terrible. (Perhaps the people at the Trader AddOn Product WaveFin have something to
say about this).

Prof Murtagh's Reduntant Haar Wavelet does not suffer from the end point distortion problem.
I have used the wavelets in two different ways

(1) As a value to predict
There have being a lot of discussion in this forum as to what to predict. To this I
can add a new value to the list, ie Level 1 or Level 2 of the Reduntant Haar Wavelet.
All the short term cyclic information resides in this two level and it can capture the
market turning points quite well.

(2) As inputs to Neural Trader
While they are not exactly magic bullets, the Reduntant Haar Wavelet can produce
good trading models if they are used as inputs to Trader as a set.

I have translated Prof Murtagh's work from VB and VC and have compiled it as a DLL
to be used as a Trader AddOn. I will be glad to post it on this forum if anyone wants it

Thanks to Bruno Voisin for informing me about Prof Murtagh's site.

Best Regards
-Victor Chu

Hi Vic,

Thanks for your most informative post. I am a newbie when it comes to wavelets, and currently studying about it.
I have a few questions regarding your post and hope that perhaps you or any 'wavelets guy' here can help:

You mentioned:
>(1) As a value to predict
>There have being a lot of discussion in this forum as to what to predict. To this I
>can add a new value to the list, ie Level 1 or Level 2 of the Reduntant Haar Wavelet.
>All the short term cyclic information resides in this two level and it can capture the
>market turning points quite well.

I have always been a proponent of predicting indicators rather than price itself and your suggestions really
make sense to me. But after predicting the Level 1 or Level 2 of the Reduntant Haar Wavelet, how do you
intend to use that in your trading strategy?
You also mentioned that all the short term cyclic information resides in this two levels. How can you best
extract this information? What kind of cyclic information resides here? Can you get the dominant cycle length
out of this information?
When you said it can capture the market turning points quite well, can I take it that the indicator makes a peak
or a trough corresponding to market peaks and troughs? Or must I perform some more complex mathematics
or interpretation to determine whether the wavelet is telling me that the market is turning?

You mentioned:
>(2) As inputs to Neural Trader
>While they are not exactly magic bullets, the Reduntant Haar Wavelet can produce
>good trading models if they are used as inputs to Trader as a set.

What do you mean by "used as inputs to Trader as a set"? Is it multiple wavelets used as inputs with
each wavelet having different parameters? Or does the Redundant Haar Wavelet comes with many
different category of wavelets that works best together as a set? (Pls pardon my ignorance with
regard to the Haar Wavelet if this question sounds stupid)

Thank you for your time and looking forward to your DLL :)

regards
JM

ps: This forum is getting more and more interesting by the day.

Hi JM,

I really do not understand Prof Murtagh's Non-decimated Haar algorithm, or Wavelets
myself and what I wrote in my last posting is based on visual observations of
the outputs.

If you run Prof Murtagh's MTV2OPEN spreadsheet using the Non-decimated Haar option, you will be prompt for a "scaling number". If you enter 6 say, you will get 7 columns, Scales 1 to Scales 6 and a column called Residues. The Scales values looks like oscillator type values in that it varies between some positve and negative values. I do not know why Prof Murtagh called his website www.multiresolution.com,
but I can see that the various Scales are "different levels of resolution" of the original time series.Scale 1 is a very high frequency time series and contains all the noise. You can observe that the peaks and troughs of Scale 2 and Scale 3 corresponds to the peaks of the original time series and hence contains the short term trend information. If you want to construct a "lead indicator" to tell the direction the time series is going, then Scale 2 and Scale 3 looks like a good value to predict. Scales 4 and
higher contains the long term trend information. The use of the term "Level" in my last posting corresponds to the term "Scales" by Prof Murtagh.

Perhaps you can use my DLL to plot the various scales and levels to see what I mean. You can download Victor's DLL and TPL in the form of a zip file by clicking here. Unzip the file and copy the DLL and TPL file to your \NeuroShell Trader\Template directory. Note, all Trader packages can use templates, but only the Professional and DayTrader packages can create them.

I have actually use Trader to predict Scale 3, using Scale 1 to Scale 6 as inputs, and Maximize Net Profit, Find Optimal Trading Rules, and (in my case) long positions only as Trader's options. The result is reasonable good for one stock that I tried, and "not bad" for the rest. As I have said, the inputs are not exactly "magic bullets". At
Prof Murtagh's web-site, there is message that says, "beware, the denoising techniques used are rather quick and dirty". I take this to mean that the Non-decimated Haar algorithm is not the best of Prof Murtagh's techniques. Of course, you can also use traditional indicators as inputs, as long as the result is good.

By the way, the Residues values act as a good moving average cross-over model. It captures all the major swings, giving few whip-saws. It beats most other moving average models.

Thanks
-Victor Chu

Hi,

We should maybe have started a separate thread, but any how, it does not really matter.

As far as I understand wavelets, there are strong similarities with FFT. The signal is decomposed into waves of different 'periods' which do add up to the original signal. I have my own Excel Add-in as you know, and I have used it so far with the good old NeuroShell 2. It does indeed give pretty good results in predicting long to medium trends (first scales), although not nearly as good when you try and predict the %change. Secondly, I am skeptical when I see most the signal sitting in the residual. Of course, this depends on the number of scales you are using, but it also means that the wavelet has probably not captured well the inner movements of the series.

I am very interested in testing it further though, and I look forward to reading your feedback on this.

Regards
Bruno

PS: please excuse my 'approximate' English.

Hi Victor,

I tried to run the DLL version of the HAAR wavelet but kept getting an invalid page fault when attempting to implement it with another proprietary indicator I use. This does not use the close price so I suspect it is calling memory that does not exist. Is it possible to obtain the c source code to the DLL so I could try to debug the indicator I am using,

kind regards,

Daniel P Lyons

On 10/30/00 12:27:43 PM Victor Chu wrote:
Hi JM,

I really do not understand Prof Murtagh's Non-decimated Haar algorithm, or Wavelets
myself and what I wrote in my last posting is based on visual observations of
the outputs.

If you run Prof Murtagh's MTV2OPEN spreadsheet using the Non-decimated Haar option, you will be prompt for a "scaling number". If you enter 6 say, you will get 7 columns, Scales 1 to Scales 6 and a column called Residues. The Scales values looks like oscillator type values in that it varies between some positve and negative values. I do not know why Prof Murtagh called his website www.multiresolution.com,
but I can see that the various Scales are "different levels of resolution" of the original time series.Scale 1 is a very high frequency time series and contains all the noise. You can observe that the peaks and troughs of Scale 2 and Scale 3 corresponds to the peaks of the original time series and hence contains the short term trend information. If you want to construct a "lead indicator" to tell the direction the time series is going, then Scale 2 and Scale 3 looks like a good value to predict. Scales 4 and
higher contains the long term trend information. The use of the term "Level" in my last posting corresponds to the term "Scales" by Prof Murtagh.

Perhaps you can use my DLL to plot the various scales and levels to see what I mean. You can download Victor's DLL and TPL in the form of a zip file by clicking here. Unzip the file and copy the DLL and TPL file to your \NeuroShell Trader\Template directory. Note, all Trader packages can use templates, but only the Professional and DayTrader packages can create them.

I have actually use Trader to predict Scale 3, using Scale 1 to Scale 6 as inputs, and Maximize Net Profit, Find Optimal Trading Rules, and (in my case) long positions only as Trader's options. The result is reasonable good for one stock that I tried, and "not bad" for the rest. As I have said, the inputs are not exactly "magic bullets". At
Prof Murtagh's web-site, there is message that says, "beware, the denoising techniques used are rather quick and dirty". I take this to mean that the Non-decimated Haar algorithm is not the best of Prof Murtagh's techniques. Of course, you can also use traditional indicators as inputs, as long as the result is good.

By the way, the Residues values act as a good moving average cross-over model. It captures all the major swings, giving few whip-saws. It beats most other moving average models.

Thanks
-Victor Chu

Hi Vic,

Thanks for your most informative post. I am a newbie when it comes to wavelets, and currently studying about it.
I have a few questions regarding your post and hope that perhaps you or any 'wavelets guy' here can help:

You mentioned:
>(1) As a value to predict
>There have being a lot of discussion in this forum as to what to predict. To this I
>can add a new value to the list, ie Level 1 or Level 2 of the Reduntant Haar Wavelet.
>All the short term cyclic information resides in this two level and it can capture the
>market turning points quite well.

I have always been a proponent of predicting indicators rather than price itself and your suggestions really
make sense to me. But after predicting the Level 1 or Level 2 of the Reduntant Haar Wavelet, how do you
intend to use that in your trading strategy?
You also mentioned that all the short term cyclic information resides in this two levels. How can you best
extract this information? What kind of cyclic information resides here? Can you get the dominant cycle length
out of this information?
When you said it can capture the market turning points quite well, can I take it that the indicator makes a peak
or a trough corresponding to market peaks and troughs? Or must I perform some more complex mathematics
or interpretation to determine whether the wavelet is telling me that the market is turning?

You mentioned:
>(2) As inputs to Neural Trader
>While they are not exactly magic bullets, the Reduntant Haar Wavelet can produce
>good trading models if they are used as inputs to Trader as a set.

What do you mean by "used as inputs to Trader as a set"? Is it multiple wavelets used as inputs with
each wavelet having different parameters? Or does the Redundant Haar Wavelet comes with many
different category of wavelets that works best together as a set? (Pls pardon my ignorance with
regard to the Haar Wavelet if this question sounds stupid)

Thank you for your time and looking forward to your DLL :)

regards
JM

Hello Daniel,

I can certainly give you the source code I will send it to the web-master winthin the next few days.

I have used an integer to represent the size of array passed in, instead of a long. If the number of bars passed in is a few thousand, it should be OK. If it is above say thirty-thousand, an overflow error can happen.

Another thing you can do is to export the indicator to a spreadsheet and try to run it with the MTV2OPEN program. Does the program crash?

Thanks
Victor Chu

Hi Victor,

thanks for your prompt reply. I will export the indicator as you suggest.

Strangely enough, the crash only occurs in real-time hence my desire to see what is happening as the conflict could be caused from my indicator...although my indicator does not normally crash when used on its own.

I engaged the DLL on the December Nasdaq futures contract in 1 min, 5 min and 15 min charts. The 1 min chart does not have more than 30,000 points so should be within your limits. I will experiment further today and keep you posted.

Also, have you also used the ATrous algorithm from Prof. Murtagh's routines?

Finally, I sent a message to John Bonn (producer of Wavefin) to clarify the end point distortion issue from their perspective re:Gabor & Morlet wavelets. Shall keep you informed of any response.

Thanks again for your help.

kind regards,

Daniel P Lyons

Hi Victor,

Thanks for the info. I've read in Katz and McCormick's "Encyclopaedia of Trading Strategies" as well as Timorthy's "Neural, Novel and Hybrid Algorithm for Time Series Prediction" and both books referred to Morlet's wavelet as use for financial filtering. I'm glad you cleared it up.

I'm also interested in the C source code. I've downloaded the fortran code from Prof. Murtagh's site but ran into some bugs when I tried to code it. Will really appreciate it if you can post yours.

Thanks, KC.

(1) As a value to predict
There have being a lot of discussion in this forum as to what to predict. To this I
can add a new value to the list, ie Level 1 or Level 2 of the Redundant Haar Wavelet.
All the short term cyclic information resides in this two level and it can capture the
market turning points quite well.

(2) As inputs to Neural Trader
While they are not exactly magic bullets, the Redundant Haar Wavelet can produce
good trading models if they are used as inputs to Trader as a set.

I have translated Prof Murtagh's work from VB and VC and have compiled it as a DLL
to be used as a Trader AddOn. I will be glad to post it on this forum if anyone wants it

Thanks to Bruno Voisin for informing me about Prof Murtagh's site.

Best Regards
-Victor Chu

Hi Bruno,

I've seen articles referring to Morlet wavelets as suitable for financial time series forecasting. They also mentioned that other wavelets are less suitable. In Prof. Murtagh's work, he used A'trous (spelled correctly??) wavelets. Can you tell me what is the difference between Morlet and A wavelet and how they are useful to financial time series forecasting compared to others?

Regards, KC

On 10/7/00 Bruno VOISIN wrote:
Hello Peter,
Interesting exercise you have done. The 100% correct sign worries me a little though.

Talking about wavelets, I have tried to use them on several occasions without much tangible success. Much of the signal remains in the residual, implying that the signal is not well captured by the waves. Some wavelet functions may be more appropriate as most of the common ones are simple not suitable for time series. In addition, I believe you should detrend your series rather than using the close.

If you are interested in the topic, you may want to take a look at Prof. Murtagh's work on www.multiresolution.com. His paper is available on http://strule.cs.qub.ac.uk/~gzheng/financial-engineering/finpapermay99.html
And I have also re-writen his VB program for faster computations. The original code is available on his site (http://www.multiresolution.com/MTv2open.zip)

One question still: what financial issue are you trying to predict?

Re: Re: Re: How to detect the NN optimal model

Date :10/28/2000 2:07:35 PM Poster : Bruno VOISIN

Hello,
I referred to Prof. Murtagh when I rewrote his A-Trous wavelet utility. I am not an expert in wavelets per se, but his following articles indirectly mentioned Morlet wavelet as not suitable. Please contact him for details. His site is on www.multiresolution.com

If you want to try the A-Trous wavelet and his subsequent modified Haar, you can download the free Excel add-on on www.foretrade.com/wavelet.htm You may even want to compare his code with mine. They are functionally identical (except for the EMA which I have not coded).

Regards
Bruno

Re: How to detect the NN optimal model

Date :10/11/2000 Poster : Steve Ward

Nice piece of work, Peter. Very well thought out.

On 10/8/00 Peter Hoon wrote:
Here are some ideas for traders seeking to detect the optimal model, and avoid over fitting in NT.

Basically, the strategy is to test the model varying the number of hidden neurons you use, while you keep a table of statistical quantities, which are printed out in "Prediction Analysis".

Background

I have developed my own forward leading smoothed target, based on domain experience and graphical analysis, about 4 periods ahead, and am seeking to develop an optimal model to predict it.

Using GA, trial and error, and visual graphics, I came up with a prediction model for it that has good "fit stats". I selected "no trades" while building my model. I am just working on model building at this time; later, I will build a trading system around this "leading indicator", designed to pick intermediate tops and bottoms.

These data are based on an out of sample of over 1600 bars, made up of the OOS evaluation portions of three walk forwards. The training and each walk forward produced virtually identical fit stats for this model, a very encouraging sign that the model is robust.

The columns listed are consecutively: number of hidden neurons in training and optimization (always kept the same), the average error, the r, the R sqd, MSE (mean squared error), and percent correct sign. The second row is the % contribution respectively of three indicators: RMI(close, 3, 7), Williams %R(High, Low, Close, 8) and Waveletvaldaub12 (close, 8, 2). The parameters for these inputs remain the same for each different number of hidden neuron models when optimization for parameter input is chosen (keeping all the inputs).

I get the same numbers below when I choose different objectives: Max R sqd, Min MSE, Max r. This also is an encouraging sign that the model is robust.

I get virtually the same numbers below when I check "balance upward and downward trending market sections".

<pre>

Hidden Avg Error r Rsqd MSE %correct sign (%contrib.) (%contrib.) (%contrib)
Neurons

0 11.4 .818 .669 192.0 100 (47.57) (47.26) (5.16)
3 11.4 .818 .668 192.2 100 (79.39) (16.68) (3.93)
6 11.4 .818 .669 192.0 100 (59.62) (37.96) (2.42)
7 11.4 .818 .669 191.9 100 (52.97) (40.81) (6.22)
8 11.4 .818 .669 192.1 100 (53.01) (41.66) (5.33)
9 11.4 .818 .668 192.2 100 (51.98) (43.19) (4.84)
12 11.4 .817 .667 193.2 100 (55.0) (40.13) (4.80)
15 11.4 .816 .665 194.1 100 (61.26) (34.46) (4.28)
20 11.4 .815 .663 195.1 100 (60.16) (36.24) (3.61)
25 11.5 .814 .662 195.9 100 (56.16) (41.17) (2.67)
35 11.5 .814 .661 196.5 100 (45.77) (45.10) (9.12)

</pre>

I'll number my statements about the data above, so traders can offer their ideas and reactions:

1) A completely linear model works well, but introducing some non-linearity by adding a few hidden neurons seems to help. Note the slightly lower MSE with 7 neurons Vs. Zero neurons.

2) The best clues to possible over fitting and possible model instability come by examining the Rsqd and MSE columns.

3) The use of 7 hidden neurons seems about optimal. You get a fairly nice spread of relative contributions, the highest Mul R sqd, and the lowest MSE.

4) After about 7 hidden neurons, the MSE starts rising, Mul Rsqd starts dropping, suggesting over fitting and possible model instability. Also, the relative contributions are not as evenly spread (RMI starts "hogging" more relative contribution) after the model with 7 hidden neurons, particularly with 20 and 25 neurons.

5) The model with 35 hidden neurons is either approaching instability, or actually is unstable: Note the unexpectedly high contribution of wavelet, and the higher value of MSE.

6) When I remove the input with the smallest contribution, wavelet, the model still works well and has good fit stats. However, keeping the input, which provides some information about cyclicity in the target, seems intuitively a good idea. The other two main contributors are principally measures of market momentum. Wavelet's presence in the model helps "spread" the relative contributions somewhat more evenly.

7) From breast cancer research using multivariate linear models, we often kept one predictor that had a relatively low contribution; it helped stabilize the model by acting as a "suppressor" variable, and it was often just at or slightly above the "F to enter or remove" level of statistical significance. Though it alone was not particularly important, we kept it because it slightly improved the overall prediction power of the model. This would be another argument for keeping wavelet in the model.

systems getting better!??

Date :10/11/2000 Poster : chris wong

this week i dug out some systems i built last year. they weren't very good last year but now they look pretty good to me. anybody got any ideas why that could be?

Re: systems getting better!??

Date :10/11/2000 Poster : RJ Young

I have no idea how to answer your question, but now I wish I hadn't abandoned the charts I made last year that didn't work!

Re: systems getting better!??

Date :10/12/2000 Poster : JM

It could be that current market conditions has changed and it favours your older systems which is actually more suited to this current condition. I know there are traders out there who use different systems for different market conditions. Heck, they even let their nets decide which system to use for current market conditions by predicting the most profitable system (using its equity curve) for current market conditions.

PowerBasic DLL

Date :10/13/2000 Poster : kc yeong

Recently, I've been working away on Pbasic programming.
With some background in Fortran programming, the transition
was quite easy. Took me a few days though to figure out how
to write DLLs.

I've downloaded some DLLs from the TASC section of this website
and some of the indicators proved to be very useful. I feel that
Ward Systems should also provide the source codes as examples
to show the full potential of NST Pro. As yet, there are just a few
simple examples on writing DLLs.

For a start, I would like to contribute a source code that I've written
recently. It is a maximum entropy analysis algorithm that I've
translated from Numerical Recipes in Fortran by Teukolsky et all.
Although it is a working program, please do not use it for trading
purposes as I think it is buggy. I've no working knowledge in maximum
entropy and hence, I do not really understand its logic. The power spectrum
plotted seemed suspiciously symmetrical. Moreover, I've tested it on a
pure sine wave curve and it did not give the desired (frequency) peak.
Nevertheless, I hope it provides a first step for those of you who are not
willing to pay $$$ for a program such as MESA.

I'm still learning and if anyone has any suggestions, do contribute.

---------- Begin ----------

```
'This program does the following:
' 1. Centers the data series in_array.
' 2. For a specified period, it calculates the mean square deviation xms
' and the coefficients d(i) using a recursive procedure.
' 3. It then calculates the power spectrum out_array for the range of
' angle [0,fdt] where fdt=0.5 and delta=fdt/cnt.

Now if I could just convince you to use Java (platform neutral) and support clustered computers with distributed processing. <grin>.

I found a book entitled "Layered Learning in MultiAgent Systems - A Winning Approach to Robotic Soccer." Each agent (soccer robot) assumes different goals during the game (pass, carry, go for a goal) and the team optimizes alternatives to maximize goals. Now, think of the same thing applied towards investing. Each agent/computer (tech stocks, retailers...?) tries to change the investing mix to maximize the goal (or profit).

Perhaps its blue-sky, but its fun to contemplate.

Really appreciate it that you're providing the source codes.
I believe that at the initial stage of learning, every available
lesson helps. Although C language is not my favourite
language for the simple reason that pointers and mem
alloc make me feel like going to Mars, I feel that these

examples will provide a "template" from which other
codes may be written.

I've just found a way to check my maximum entropy algorithm
codes. (THERE IS HOPE.) I've just found a software package
from the net called TISEAN. It specializes in chaos stuff. In it
is a code that is written in C (mem_spec.c) that lays out the logic
to implement the algorithm. Coincidently, it is also based on
the algorithm from Numerical Recipes.

I'll update the code once I'm done.

A question that is on my mind is: Can the algorithm be coded so
simply when software packages such as MESA is selling for
hundreds of $? I do not really have the answer but once, I've
seen somebody refer simple codes as 'quick and dirty'.
Although I confess I do not know what that means, my
impression is that simple codes do not handle certain subtleties
that may arise. Thus, perhaps professional codes are professional
simply because they encompass a wider scope of application.
On top of that, commercial packages also provide useful graphical
user interfaces that ease usage. With that in mind, I believe that
even though simple codes such as those found in Numerical
Recipes may be limited, I would not discount it as useless because
the book is very reputable. It's a household name in the
scientific community.

A second question is its capability. Being an alternative to
FFT for the reason that it can be applied to non-stationary
time-series and its ability to resolve the frequency components
better, it might be mistaken for magic. But I've seen many
books referring to it as _the_ method for finding market cycles.
Does anyone have any thoughts on this? How does it compared to
wavelets?

Hope I'm not out of line in this forum…

Curiously, KC

I bought the MESA software for the Trader program as well as WaveFin from Cornice Research, www.corniceresearch.com, but I haven't had a lot of luck with either. That may very well be because I have not put the time into working with the programs that they require. I'm also very new to wavelets, so operator error may to be blame not the programs. I would be interested in hearing if others have had any luck in this area and how they applied them. I would also be willing to experiment if there are any suggestion out there.

Regarding wavelets, most wavelet functions are simply unsuitable for time series computations. They do require sampling on both sides of the time point in question, which would mean looking into the future too. There have been many attempts to overcome such problem (for example using padding). If I am not mistaken, Prof F.Murtagh's work (http://www.multiresolution.com) is among the most advanced in this field. It is mathematically rigorous, therefore could be used in neural net predictions. FYI, I have rewritten his Excel-based utility for faster computations, and it is available free on http://www.foretrade.com/wavelet.htm

Good luck,
Bruno

scientific community.

A second question is its capability. Being an alternative to
FFT for the reason that it can be applied to non-stationary
time-series and its ability to resolve the frequency components
better, it might be mistaken for magic. But I've seen many
books referring to it as _the_ method for finding market cycles.
Does anyone have any thoughts on this? How does it compared to
wavelets?

Hope I'm not out of line in this forum…

Curiously, KC

On 10/13/00 Steve Ward wrote:
Thanks for a great contribution. You're right, we should be providing the source code for TASC DLLs, and we will. Unfortunately, I believe our programmers used C, even though I'm convinced Powerbasic is a far better choice. But the source code may still be helpful to some.

Portfolio Optimization

Date :10/14/2000 Poster : Steve Ward

Mike's thought below deserves its own thread. I don't think it is blue-sky. In our October Newsletter we will mention the GeneHunter examples that do portfolio allocation and optimization. It seems like a very easy thing to define a variable (chromosome for GeneHunter users) that specifies what percentage of your assets should be in tech, another specifying the percentage in retail, etc. You optimize those variables based on the profit they would have made over the last N weeks (you select N), thereby giving you the portfolio mix that (hopefully) should be valid at least in the near future.

As an extension, you could use the NeuroShell Classifier to classify the current state of the market into one of several categories. Then in the GeneHunter optimization, instead of using the last N weeks, you use data from the most recent period when the market was also classified in the same category as today.

Anyone have thoughts to add? (I'm going to post this on the GeneHunter forum too in case any GeneHunter users want to comment.)

Mike wrote:
I found a book entitled "Layered Learning in MultiAgent Systems - A Winning Approach to Robotic Soccer." Each agent (soccer robot) assumes different goals during the game (pass, carry, go for a goal) and the team optimizes alternatives to maximize goals. Now, think of the same thing applied towards investing. Each agent/computer (tech stocks, retailers...?) tries to change the investing mix to maximize the goal (or profit).

Perhaps its blue-sky, but its fun to contemplate.

Security Device and Laptop Installation

Date :10/16/2000 Poster : kc yeong

I'm having difficulty installing NST in my laptop. My laptop does not have a db25 parallel port. It has USB ports instead. I've tried to use adapters (two to be more specific - (i) RS232 parallel to serial and (ii) USB to parallel). Although the second adapter connects successfully to my printer, I still get the message that the security device is not detected whenever I try to run NST.

Any suggestions? Thanks.

Regards, KC

Re: Security Device and Laptop Installation

Date :10/18/2000 Poster : Bruno VOISIN

That's a tech support question. I believe WSG does provide USB dongle replacement for the Sentinel SuperPro original security block.

PowerBasic Code for Maximum Entropy Analysis

Date :10/18/2000 Poster : kc yeong

I'm feeling happy today! For the simple reason that my little maximum entropy
project is finally completed. Below is the source code. I've decided to rename the
code from MESA to MEPS (for some obvious reasons :-( ).

I've found out that the original code that I've posted earlier is actually correct. But
it needed some minor corrections so that it makes more sense. Comments are included to make it self-explanatory.

Regards, KC

```
---------- Begin ----------
'
' This program calculates the maximum entropy power spectrum (MEPS) for input_series[i].
' Two important parameters to choose carefully are the number of poles (poles)
' and the resolution of the power spectrum (fdt). They determine how the power
' spectrum will look like. The action of the code is as follows:
'
' 1) Preprocesses the data by detrending it to remove the long term (linear) trend.
' 2) Calculates the mean square deviation xms and coefficients d(i) using
' Burg's algorithm.
' 3. Calculates the maximum entropy power spectrum pow_spec.
'
' References: 1)Numerical Recipes in Fortran by Teukolsky, Flannery, et al. (A very
' technical and somewhat brief review but this is where the codes are
' found). Can download the whole book from the internet for FREE. Yipee!
' 2)Neural, Novel & Hybrid Algorithms for Time Series Predictions
' by Timothy Masters. (A practical approach - highly recommended for those
' with some math background).
' 3)MESA and Trading Market Cycles by John Ehlers. (For beginners).
' 4)Internet Search...
'
' I would also like to point out that References (1) and (2) present a more objective
' viewpoint to using MEPS and they do point out some of the subtleties (read difficulties)
' in using MEPS.
'
' There are 5 variables altogether - 4 input and 1 output. The calling procedure is
' EXTERNAL DLL CALL by ARRAY with the following declarations:
'
' #1 ---> ByRef Double as Time Series (for input_series). Default is Close.
' #2 ---> ByVal Integer as Numeric Value with Integer>0 (for poles). Default is 20.
' It usually ranges from 20 to 150. Low values are prefered. As a general guide,
' the ratio (poles/length) should be a small number. Higher values give more peaks
' in the power spectrum and lower values give a smoother spectrum.
' #3 ---> ByVal Double as Numeric Value with Real>0 (for fdt). Default is 0.2. It
' can take on values from 0 to 0.5. This is the one that is connected to the
' concept of Nyquist frequency in FFT. Allows you to zoom in the power spectrum
' for a more detailed look. Usually, a lower value is desired for finer resolution.
' #4 ---> ByRef Double as Indicator Output (for pow_spec). This is the power spectrum.
' #5 ---> ByVal Integer as Number of Value in Time Series (for length).
'
' For a start, you might like to plot three indicators with poles=20,50,100 while holding
' fdt=0.2 as the constant. Then, superpose them together to see how increasing the number
' of poles affects the spectrum. Then proceed to read and experiment, and read and experiment
' more and read.....

Re: PowerBasic Code for Maximum Entropy Analysis

Date :10/19/2000 Poster : Ward.net Webmaster

KC,

Since some of our users do not have a compiler, perhaps you could send us the compiled DLL and a *.tpl file so that all users could use this. Just send an email to forum@ward.net with the files attached. We will then provide a link from which users could download.

Thanks,
Ward.net Webmaster

Stocks and Commodities Tips Source Code

Date :10/19/2000 Poster : Ward.net Webmaster

Source code for many of the Stocks and Commodities Tips can be found in Trader Tips from Stocks and Commodities section of this site. There is a self extracting archive available for download with the source files. The majority of these have been coded with Visual C 6.0. It is assumed that you have some knowledge about programming and building DLL's as it is beyond the scope of our technical support department to assist you in this matter.

Re: Stocks and Commodities Tips Source Code

Date :10/23/2000 Poster : kc yeong

Thanks for posting the C source codes. They make great examples and understanding it is easier than I thought.

Regards, KC

MEM Update

Date :10/21/2000 Poster : kc yeong

I've updated the maximum entropy method code. There are some changes,
the main one is on how the power spectrum is displayed. I've also sent mem.dll and
mem.tpl to WebMaster. You can download a self-extracting archive file, mem.exe containing the DLL and TPL using this link.Below is the source code. Please read the comments even if you
do not intend to compile it because there are some instructions on how to use the
algorithm.

As I've said earlier, this project is experimental and its focus is really to show how the
maximum entropy algorithm can be coded in PowerBasic. Understanding the algorithm for
trading purposes is an even larger hurdle which I'm currently embarking on. I think that
fundamental to its understanding is FFT. So, I'm digging up some old text to refresh my
memory. Finding suitable learning materials that I can understand is also another hurdle.

I've tested the code by using a pure sine wave and it gave the desired peak. If
anyone is interested, this is how I generated a pure sine wave using NST. All I've done
was simply to pick my most hated stock (in metastock format), erased its data with
Metastock Downloader and cut-and-paste the sine wave data generated from Excel.
I'm currently trying to use the code to resolve a combined sine wave. This is where
the real power of mesa lies, its ability to resolve nearly equal frequency components.
For example, if the combined wave is 3sin(2*pi*f1*t)+2sin(2*pi*f2*t), then the code
should give two peaks that corresponds to frequencies f1 and f2. Usually, f1 and f2 can be
quite close to each other. While methods such as FFT and wavelets tend to give peaky
spectrum and make the identification difficult, MEM's spectrum is relative smooth. If
anyone has found other uses, do share.

```
'
' This program calculates the power spectrum of input_series[] using the
' maximum entropy method (MEM). There are two parameters to adjust. The first
' is the number of poles (npoles). It determines how well the spectrum fits the input
' data. [Some technical details: MEM actually uses a fitting procedure like fitting
' a polynomial to a curve. The number of poles represents the number of coefficients
' of the polynomial used to fit the data.] If you choose a small number of poles
' (i.e. npoles=20), the resultant power spectrum will appear smooth with a few
' peaks. A higher number of poles (npoles=100) will give many peaks as the spectrum
' tries to fit into every corner of the data. The problem with using a large value of
' npoles is overfitting. It tries to find whatever peaks, whether it is there or not.
' The second parameter is the number of frequencies to display (nfreq). This actually
' is related to the resolution of the spectrum. Remember that the displayed graph is
' power spectrum (vertical axis) versus frequency (horizontal axis). The value of nfreq
' changes the frequency scale. If you want to get a closer look at a peak, use a
' larger value of nfreq to zoom in on the power spectrum. A special requirement is that
' nfreq be larger or equal to the number of input data points. If the condition is not
' met, nothing is displayed.
'
' The action of the code is as follows:
'
' 1) Preprocesses the data by detrending it to remove the long term (linear) trend.
' 2) Calculates the mean square deviation xms and coefficients d(i) using
' Burg's algorithm.
' 3) Calculates the power spectrum pow_spec and display it.
'
' References: 1)Numerical Recipes in Fortran by Teukolsky, Flannery, et al. (A very
' technical and somewhat brief review but this is where the codes are
' found). Can download the whole book from the internet for FREE. Yipee!
' 2)Neural, Novel & Hybrid Algorithms for Time Series Predictions
' by Timothy Masters. (A practical approach - highly recommended for those
' with some math background).
' 3)MESA and Trading Market Cycles by John Ehlers. (For beginners).
' 4)Internet Search...
'
' I would also like to point out that References (1) and (2) present a more objective
' viewpoint to using MEM and they do point out some of the subtleties (read difficulties)
' in using MEM.
```

```
'
' There are 5 variables altogether - 4 input and 1 output. The calling procedure is
' EXTERNAL DLL CALL by ARRAY with the following declarations:
'
' #1 ---> ByRef Double as Time Series (for input_series). Default is Close.
' #2 ---> ByVal Integer as Numeric Value with Integer>0 (for npoles). Default is 20.
' It usually ranges from 20 to 150. Low values are preferred. As a general guide,
' the ratio (poles/number of input data points) should be a small number.
' #3 ---> ByVal Integer as Numeric Value with Integer>0 (for nfreq). Default is 2000.
' This parameter changes the frequency scale (horizontal axes). If you use a
' larger nfreq, the power spectrum will be plotted on a finer frequency scale.
' #4 ---> ByRef Double as Indicator Output (for pow_spec). This is the power spectrum.
' #5 ---> ByVal Integer as Number of Value in Time Series (for length).

MEM and other market tools

Date :10/23/2000 Poster : kc yeong

Be warned: This is a long article :=) This article summarizes
my current thought on what are the relevant tools to use to
analyze the market. If you have a different opinion, please
share.

I've been learning classical Technical Analysis for a while now
and I still do not get it. How I envy when I read or hear people
say that they managed to develop profitable systems after
six months into studying TA.

After reading some articles on applying signal processing (the main
subject of Electrical Engineering) to market analysis, I'm
beginning to see the significance of how and why all those types of
averages and indicators are used in analysing the market. And I find
it fascinating because it presents to me another dimension to
understanding TA. My interest in maximum entropy method arises
from this study.

So, how should MEM be used? And also FFT and wavelet? The
way I understand it, I think they are most useful if they act as data
pre-processors for neural networks. Took me some time to realize and
arrive at this conclusion. In order to understand why, we need to understand
the function of these algorithms. All of these algorithms have a common
function, that is, to process (or transform) a time-series so that we can
see it in terms of frequency components. In other words, instead of
seeing a given data series as some number at a certain time, we get to
see it in terms of some number at a certain frequency. The number in time
is different from the number in frequency. The former represents price (close)
or price range (high minus low). If there is a large price range at time t1,
that reflects a significant period of volatility. The latter number represents a
different type of information. It shows the magnitude (or importance) of a frequency
component. For instance, if there is a large peak in the MEM spectrum,
we can interpret it this way. The height of the peak represents power, which
is the number for the frequency series I mentioned earlier. A high peak at a
frequency f1 means that this frequency is significant and may be important
compared to those frequencies with lower peaks. How high is high? A high
means that there are other short ones. Hence, high is relative. It has to be
interpreted within the spectrum and compared to the other components in
the spectrum. So, does power represent anything useful? Like price is to time?
Unfortunately, no (as I understand it). Its interpretation is mainly to identify
which frequency is important. Other than that, as far as I understand it,
it has no meaning. So, this leads to my claim that such techniques are
data-preprocessors. We use these techniques so that we can 'see' the time-series
from another viewpoint, in terms of frequencies. Assuming that there are hidden
information in the frequency-series, we can let neural network sort out which are
important and which are not. Of course, when I say MEM, it means the
simple MEM code that I've written. Other commercial products may extend
the usability of the algorithm so that it can do other things. I have not
used such softwares. Perhaps those who have used it may like to say something
about other aspects of its application?

So, experts say we can use these methods to profit from the market. But why?
What is really the rationale for their claims. I will explore this further below.

The main assumption of this sort of analysis is that markets move in cycles.
So, we can say that if you believe in this assumption, you believe in a Wave
Theory of the market. I have rephrased the statement above for an important
reason. The key word is Wave Theory. It supposes that market moves are similar
to water waves found in the ocean, sound waves we hear ever so often, or
light waves that allow us to see through our eyes. All of these have something
in common, some regularities in their movements. This thought came to me recently
and struck me like lightning. So, allow me to elaborate.

Let's explore what are not waves. Let's say that the market is really random (so hurray
to Random Walk supporters). Random means no patterns exist. So, it means that the
market is not periodic. And using any methods having to do with periods or cycles is
doomed for failure. So, random signals are not periodic.

What if the market is periodic? This is really an assumption because I do think if anyone
really knows. There are some diagnostic tools that can be used which I'll elaborate later. So,
for the time being, let's assume that the market is periodic. More precisely, it is mildly
periodic, with a lot of noise. Further, let's assume that the waves are linear (there are also waves
that are nonlinear such as solitons, if I'm not wrong, which will make things rather difficult).
The linear property basically means that two or more waves can be added or subtracted from
each other. This important property therefore allows us to decompose the waves into its frequency
parts by simple arithmetic (instead of some nasty nonlinear partial differential equations).
Then, we can say that the market moves are really (signal + random). The main interest is the
signal part which is periodic. To get a better signal, we need to eliminate the noise by using
technical indicators such as moving averages or digital filters like Butterworth filters.

So, what can be responsible for the signal part of the time series? Since market participants
are you and I, we are the ones that cause periodicity. Each of us has some internal clock.
It may be due to social conditioning or just human nature (I'll leave this part is a bit vague because
of my limited knowledge in this aspect). If there are only ten market participants in this world
and we monitor their trading patterns for some time, we may most likely be able to predict their
trading habits and patterns. With millions of participants, each with different investment
horizon -- short, medium, or long term, market moves appear chaotic. And within the chaos,
if we're lucky, we can find some periodicity.

To end it all, I would like to say something about the diagnostic tools I mentioned earlier. These

are tools of chaos theory. In it are magic words like dimension embedding, Lyapunov exponents
and Takken's Theorem. Although still at its infancy and not to mention, extremely difficult, there
are ways where we can use to assess whether a time series is random or chaotic. If random, no hope.
If chaotic, there's hope. Sometimes, we say deterministic chaos, meaning that there are certain
quantities that actually remain constant within the chaos. Sounds like periodicity, don't you think?
But then again, it is constant in phase space, not frequency.

What issue to pick?

Date :10/26/2000 Poster : Steve Ward

Here's a way almost EVERYONE out there can contribute to this forum and help everyone else.

I've noticed for years that some issues (stocks, futures, indexes, whatever) are more "predictable" at times than others. Later, they usually become unpredictable, probably based on news or other external factors difficult to capture in inputs. When they are "predictable", many different types of indicators and strategies work well. At such times, you don't need to be a rocket scientist to build good models for those issues. Many of you are concentrating on finding the perfect "killer" indicators. Maybe you should be looking for the "killer" issues?

I have often found that the candidates for these good issues are those that I'll call "cyclic": i.e., they go up and down frequently either during the day or over a few days or weeks. Today's markets should be full of them.

So here's the request. Tell us what issues you are currently finding predictable. If you haven't built a good model yet, at least contribute by telling the rest of us what issues you have found that appear to be "cyclic" recently, and preferably not being driven by strong news related to that issue. Those become candidates for our models. Furthermore, tell whether this cyclic motion appears in daily bars or hourly and smaller in intraday charts. Post on this thread.

There are so many issues out there to search that everyone can be a positive contributor, even if you just got the Trader and haven't even learned it yet. How about it?

I'll start off: I have been concentrating lately on Boise Cascade (BCC), both daily and half-hour bars. I have made money in the past with this stock using nets, and another reason it may be good now is that the price is low enough that you can purchase a big block without going to options. But I know there are better candidates out there than BCC. What do YOU like?

Re: What issue to pick? - Any help from Hurst??

Date :10/26/2000 Poster : Jacobs

When selecting an issue, do you have any help of calculating the Hurst exponent (or Hurst Significance)? [Advanced Indicator Set 1 - Add on]
What figures have you found for BCC?

I hadn't though of that, but Hurst is an excellent idea, especially when there is no obvious news related to the issue. I get about 30% to 60% annualized return when BCC is predictable.

Previously I hadn't tried Hurst, but here's a chart I made where I tried it. This indicator is supposed to indicate randomness between -1 and 1. Below -1 it is anti-persistent, meaning it reverses direction a lot, sort of anti-trending. The signals are out of sample, and the green line is an adaptive moving average made with our Adaptive Net Indicators addon.

Hello Mr Ward,

You have made an interesting point.

I have found that my models work very well at times, but at other times they just flater.

So do you have any indicators or ideas that will tell us when the market is "predicatable" or not so that when it is "predicatable" we will trade accordingly and when it is not then we will just ignore the signals?

Regards
-Victor Chu

The idea that Jacobs had on this thread, to use Hurst, sounds like it might be effective, unless the issue suddenly becomes unpredictable because of news. If a major brokerage changes their recommendation, or a bad earnings report comes out, it might not be easy to catch before hand.

Steve

Thought at this point I would stop lurking and contribute.

Firstly, I wanted to say congratulations on this discussion group. I believe it is a good and worthwhile tool, especially for yourselves at Ward, to see how people are using your product and what improvements might me made and of course for us, so that we may find new and useful ideas.

This response is one of encouragement rather than specific technical information. I am amazed by the contents of what I have read here. So many of the contributors asking for specific indicators etc.,
I have used your product for two years now. For the first year I did not produce a worthwhile model. However, I kept a diary of my attempts and after one year decided that my approach was incorrect. Having changed my approach I have built models using both the genetic algorithms and neural networks that have added significantly to the timing of my trades. Your product has paid me back several times over the amount it cost, especially in the recent past.

Prior to using NST I had built a mechanical trading system (MTS) which had been enhanced over a ten year period. This MTS allows me to gauge accurately the probability of a stock changing trend in the short term, NST had added to timing the turn.

Although I purchased the Adaptive Net add-in around nine months ago I have not had the time to use it. I find the indicators that arrived with NST sufficient to form a basis for my work. I am therefore surprised at the effort people are going to to find more esoteric indicators, as if suggesting that the built in indicators are poor.
As such I believe (and mean no offence) that there is an element of running before walking going on.

One of your contributors remarked that other traders seem to take up technical analysis and find (almost immediately) a successful system, this undoubtedly shows a level of discipline. Discipline, I find is the single most important element to trading. Discipline not to take profits early or let losses run. Sounds familiar, yes, but I do not believe any package is going to teach a human discipline. We are all tempted to override system signals at some point.

I sympathize with you chaps in the US. I live in the UK and have found the FT-SE 100 index works with NST. Although my MST works with the Dow (DJIA), NASDAQ (Composite) and S&P 500, I have not been able to reproduce the same level of accuracy or consistency with the American markets. I do believe though that it is just a matter of time.

Lastly, I think your product is very good. I would though like to see a higher level of user programmability. I believe it is too manual. I would like to cut and paste indicators and parameters and would also like a Visual Basic like language built in. Sorry I had to ask. Why? Because I could then program and walk away reviewing results instead of sitting in front my machine day and night, quite literally.

Thanks again

Ergo

After reading this thread, I get the feeling that "one of the contributors" must be me. Just a wild guess. Anyway, I'd like to take this opportunity to clarify. Some of my initiatives and remarks may have been misunderstood as undermining the usability of NST's built-in indicators. If such are the thoughts, do accept my apologies. I do find the range of indicators offered by NST very impressive and coupled with its dll capability makes the usability of NST limited only by imagination, a feature that I have been looking (hard) for two years and now, found. And some remarks made are more of a reflection of my current thoughts on general trading strategy development and issues that may not be in line with in this forum. Don't worry, it's gone.

My remark that classical technical analysis is difficult is just that, the keyword being classical. It is my belief that advanced methods such as NN and genetic algorithm offered by NST, which belongs to Advanced TA, does offer a lot of opportunities in exploring the market. In the process of focusing on larger issues at hand, I have left out the fact that the statement was actually referring to short-term trading in the range of 1-3 days.

I admit that I'm not using the full capability of NST, i.e., in the area of NN and genetic algorithm. It does not mean that I do not find them useful nor understand how to use them. I do intend to use them once I get some more ideas on how to use it in terms of my own understanding. And I believe that data preprocessing is an essential area of focus in using NN successfully. And that is why I'm interested in MEM.

On the issue of whether it takes rocket science to trade, I think it is a matter of personal preference. And, as far as I know, many software packages do not offer enough technical details for using advanced indicators such as wavelets and principal component analysis. These methods are definitely useful. But I do not like to treat them as black boxes. Hence, my present approach is really to program tools that I find useful and can understand completely. And in the mean time, wait for the day when I can fully understand the pre-packaged tools. There are many references out there. So, I do not see how it has anything to do with running or walking. To me, it is about maximizing profit.

Disagree. Different people have different market belief system. And different people have different backgrounds and training, not to mention different real life experience. An engineer will tend to use those tools that appeals to his engineering background, while a physicist tends to use tools akin to rocket science. People like KC are clearly an engineering species, and of course will be attracted to tools like FFT and MEM which makes sense to his engineering mind. And people like Vic, who are more inclined towards physics will look at the market thru the eyes of his wonderful Wavelets. However, for mere mortals like me, I am still looking at the market the same way people have been looking at it 10-20 years ago, ie, thru conventional tools that I can understand, like Stochastics, Mov Avg, RSI etc. This is not to say that these tools are no good, but just that I can understand them, therefore, I am comfortable in using them. However, this will not stop me from taking a peep at the market using other's people's periscope, like KC's MEM or Vic's Wavelets. After all, isn't trading about making money, profits, bottom line? And as long as the tools hold promise to greater future wealth, why not? So I don't believe that these gentlemen here are looking out only for esotoric indicators, but rather, what their belief system tells them to, and what their training makes them comfortable with. Do not forget, alot of traders among my peer, and possibly among yours too, disregard neural nets as simply curve-fitting tools that are useless in realtime trading. I am a software engineer and system trader by training and therefore knows what neural nets can do. To my peers, they are simply esoteric tools, but to me, they gave me the edge I need in trading. So whether it is running or walking, I think it is relative. What is considered "running" to you may be "walking" to others and vice versa.

>I sympathize with you chaps in the US. I live in the UK and have found the FT-SE 100 index works with NST.

No sympathy needed. I believe NST can work with all stock indexes, be it the FTSE, SP, DOW, STI or NASDAQ.
It is just a matter of building the correct model and I believe with due diligence, you or I can succeed with NST.
Not to forget, our American friends can still trade the FTSE futures or the FTSE stocks if they so wishes, and the FTSE is not the cash cow reserved solely for the Brits. I reside in Singapore but I trade the US bonds and e-mini SP.
Who knows, someday, I might just try the FTSE too, hopefully, with some hints and tips from you :)

>Lastly, I think your product is very good. I would though like to see a higher level of user programmability. I believe

>built in. Sorry I had to ask. Why? Because I could then program and walk away reviewing results instead of sitting in front
>my machine day and night, quite literally.

Yes, I believe NST is a damn solid product and it is getting better. I don't know why there are so many financial websites out there purporting to have built accurate and extremely profitable NN models using another product when there is NST with its many add-ons and even a DayTrader version that the other product doesn't even come close with respect to NST capabilities. My partner and I concluded that there can only be one reason. Those NST traders are so successful with their models that they do not have the time to sell their signals, nor do they need to. As for a VB language, why not? But will this distract Ward System's people from their main job of producing good NN packages? I forsee there will be an increase in technical support regarding programming, system writing, supposed language bugs etc. Furthermore, Ward's programmers will be hard-pressed to solve programming language problems, add newer features to the language, improve compiler/interpreter performance etc, unless of course, Ward Systems want to become another language vendor :) I have a better suggestion, why not "open up" NST by giving us a set of API or COM-enable NST, so that we can manipulate NST using our own favorite language like Delphi or VB or C++. In that way, this will save Ward alot of work as the responsibility of programming and trading system development now lies squarely on the shoulders of the users, and at the same time, this will give advance users more flexibility and power to work outside of the NST environment, leaving Ward System the much needed time to improve on the core NN engine and more fantastic (read, profitable) add-ons :)

regards
JM

ps: Thanks to Vic for the wavelets DLL. Will definitely 'play' with it.

I've noticed for years that some issues (stocks, futures, indexes, whatever) are more "predictable" at times than others. Later, they usually become unpredictable, probably based on news or other external factors difficult to capture in inputs. When they are "predictable", many different types of indicators and strategies work well. At such times, you don't need to be a rocket scientist to build good models for those issues. Many of you are concentrating on finding the perfect "killer" indicators. Maybe you should be looking for the "killer" issues?

I have often found that the candidates for these good issues are those that I'll call "cyclic": i.e., they go up and down frequently either during the day or over a few days or weeks. Today's markets should be full of them.

So here's the request. Tell us what issues you are currently finding predictable. If you haven't built a good model yet, at least contribute by telling the rest of us what issues you have found that appear to be "cyclic" recently, and preferably not being driven by strong news related to that issue. Those become candidates for our models. Furthermore, tell whether this cyclic motion appears in daily bars or hourly and smaller in intraday charts. Post on this thread.

There are so many issues out there to search that everyone can be a positive contributor, even if you just got the Trader and haven't even learned it yet. How about it?

I'll start off: I have been concentrating lately on Boise Cascade (BCC), both daily and half-hour bars. I have made money in the past with this stock using nets, and another reason it may be good now is that the price is low enough that you can purchase a big block without going to options. But I know there are better candidates out there than BCC. What do YOU like?

I have had a lot of success modeling and trading XOM. The Neural Indicators Recurrent Nets 5 have worked well when I use it as the input to a conventional network. Then I would optimize the parameters. Generally I would use a 5 year training range and evaluate the out of sample performance over three years. The criteria I use for evaluting is how well it outperforms against a buy and hold strategy. It should generally be at least twice as good with an equal amount of succesfull long and short trades.

I have made some good models on XOM using training data from 1985 to 1990 and reviewed its out of sample performance to date. They seem to hold up well.

If anyone has some other issues that seem to model well I would like to hear about them.

Also, as I am always in the market with XOM I maintain a short position in my account at all times. If I get a long signal I will double up the longs in my account. This allows me to reverse by (closing longs) and leaving untouched the shorts in the account. By maintaing the shorts in this manner you can eliminate the worry of trying to get a short order filled in a down market (uptick rule).

Hello Tom

can you please explain again how you are able to get around the Uptick Rule
problem for short selling?

Thanks

Ok, we're starting to roll now; we've got LEH and XOM. Let's hear from more of you!

Caution 1: If you load LEH from Quote.com, watch out for Sept 25th, 2000. Some of the Quote.com servers are giving what looks like bad data for that day. Remember you can fix it in the Trader by right clicking on the close and selecting "Modify selected data file".

Caution 2: If you don't have the DayTrader, you can merge daily XOM data with daily with XON data if you're careful. Export a text file from Trader for XON and rename it XOM, but first delete the last day traded if the Trader put asterisks in any of the fields. Then map the directory where you place the text file. The Trader will put the two together successfully if you make sure those asterisked bars are removed. If you have the DayTrader, you'll be able to get so many recent intraday bars from XOM that merging with XON won't be necessary.

My observations of the stock market suggest that good companies rise faster and fall slower relative to other companies. I know that is an obvious statement, but to me, proper selection criteria will "cull" 99% of the poorer performers. Once this task is complete, then modelling becomes simpler as the remaining companies are usually more reliable and stable. From practical experience, much of this criteria has been devised by Strategic Management Consulting firms, venture capitalists and so on. And, much of the critical ratios and data utilised often create "leading filters" and even better still is available in electronic form. To give an example of such companies, here are 6 that I followed since March 99. The results of these companies will speak for themselves:

EMLX
SILI
TQNT
INFY
AMCC
QLGC

So in summary, I feel one should step back and think how you would evaluate a company from a purchase or takeover perspective and develop selection criteria accordingly. Personally, I use about 20 criteria as part of my selection process. From there, I believe modelling the various trading scenarios is a much simpler task...particularly given the power that NST offers.

Daniel

I used TC2000 to generate a potential list of stocks with the following characteristics: large cap, avg vol greater than 500k, 2 and 5 year price growth between -15 and 15%, price above $12 and beta (compares volatility to S&P500) between .75 and 1.25. Most of the stocks returned by this scan are familiar names whose charts don't have extended trends either up or down. They are more up and down with slight upslopes or downslopes. I chose Delta Airlines (DAL) and put together a quickie prediction/trading strategy using daily data and was pleasantly surprised at the results. These tickers may exhibit the type of cyclicality using daily data that NSTrader works well on. Here's the list: BR, CB, CHV, DAL, GM, HI, HMA, OXY, PD, RAL, RD, TRW. It may be helpful to include an intermarket type of indicator input for the predictions. For example, if you choose OXY then you may also want to look at the Amex Oil Index and the S&P500. This gives the net a chance to put price movements into perspective, so to speak.

I made a stab at this problem earlier this year (Ed: see below). Note: I have not implemented this idea. If one buys into the theory, then there are not a whole lot of stocks out there to model. At least using monthly data to perform the calculations. If you believe the theory has merit, then results could be calculated using weekly data as opposed to monthly.

Stock Candidates For Neural Networks

Can one find stocks that are cyclic in nature as opposed to trending. The best type of stock to model for neural nets are ones that do not trend. In other words, one wants to model a stock that is cyclic.

Is there a metric that would be of help in identifying stocks that have a tendency to be cyclic as opposed to trending? I believe that I have come across such a metric. That metric is the Z Runs Score and it's associated Z Runs Confidence factor.

What is a Z Run Score? A Z Run Score identifies, for a given holding period, the types of winning and losing streaks. For example, using a holding period of a month, stock XYZ could have: Win/Loss/Win/Loss. Or the stock could show: Win/Win/Loss/Loss. Now the important thing to find out is if the stock sequences of wins/losses are just random events of are they significant from a statistical point of view. This is where the Z Runs Confidence factor comes into play. The Z Runs Score can be positive or negative. A positive number indicates that winning holding periods are followed by losing holding periods. A negative number indicates the winning holding periods are followed by more winning periods and losing holding periods are followed by more losing periods. Regardless of the sign of the Z Runs Score, the Z Runs Confidence factor tells us if we can have any confidence in what the Z Runs Score is telling us. For one to arrive at a valid conclusion the Z Runs Confidence factor should be 95% of higher. Z Runs Confidence factors in the range of 90% to 94% suggests that one is viewing an anomaly (for neural network modeling I would not exclude those stocks that fall into the 90% to 94% range). And just plain forget any stock whose factor is less than 90%.

For more information on Z Runs Score and Z Runs Confidence read " Profiting From The Z-Score" by Mike DeAmicis-Roberts in the January 1998 issue of Technical Anlaysis of Stocks & Commodities. Note: the formula shown in the article is incorrect and the correct formula can be found in the March 1998 issue.

Re: What issue to pick?

Date :11/30/2000 10:23:45 AM Poster : Steve Ward

We found a copy of the article on our TA of Stocks and Commodities CD of previous articles. The formula was indeed wrong, but TASC faxed us a corrected article. The new formula is below. However, the formula is for making a statistical analysis of a trading system you are ALREADY using. So it appears to be more for determining the cyclic nature of your trading systems than for determining the cyclic nature of your stocks. As the article puts it, it compares "the number of streaks there are in a set of trades with the number of streaks that could be expected randomly".

If you are interested in this subject, we suggest getting not just the article but one of the books mentioned in the references of the articles before trying to use the formula:

1. Paulos, John Allen[1992]. "Beyond Numeracy", Vintage Books
2. Vince, Ralph[1990]. "Portfolio Management Formulas", John Wiley and Sons.

So here's the formula:

Z Runs Score = (N*(R-0.5)-X)/sqrt((X*(X-N))/(N-1))

where N=total number of trades (the article says you need at least 30)
X=2*winning trades*losing trades
R=Number of runs (each time your trading system switches between a losing and a winning trade, it is 1 run)

Since NeuroShell Trader has indicators for winning trades and losing trades, you can probably build this as a Trader indicator. (See the category called Trading Strategy: System Information.) However, you'd probably need to build a small DLL to compute R, because we couldn't immediately figure out how to compute R easily in the Indicator Wizard. You could feed that DLL the Trader indicators for consecutive winning trades and consecutive losing trades, which are probably enough for the computation of R.

In my opinion, issues are only predictable to some extend, if their changes in price are not random. Exactly this is claimed (since most statistical concepts need normal/near normal distribution of data) by the academics, and they are right - sometimes.

Technical analysis, it does not matter what kind, needs dependencies in price changes of the data. Academics say, since markets are efficient (this assumption is NOT always correct), such inefficiencies do not exist. - This is wrong - sometimes.

The best way to find out whether an issue is exploitable with technical analysis (neural nets or simple machanical models or whatever) is to use a concept called "Hurst Exponent" to measure the fractal dimension of the data. Sounds rather scientific, but is easy to handle. You just need someone how gives you access to an ad-on that calculates the Hurst-Exponent of you data. The Hurst exponents returns values between 0 and 1.

Let´s come to the interesting part now: Prices changes are not either random or dependent. They can also be in between of the two poles. You can determine a trigger level of dependence in the data, necessary for your system to be able to deal with the data.

For the beginning you should just read about the Hurst exponent. Skip the formulas if you are not intersted in them and try to understand the basic concept. Then you do not need to search for the right issue. Hurst will tell you which is exploitable. Then you should start your individual technical analysis, not before.

By the way: Since I am no a programmer I am looking for an Hurst exponent ad-on for NSTrd Pro. The fractal dimension indicator of one of the ad-on products does not calculate the hurst exponent. - If someone has a solution - please contact me on the forum.

Ah - excuse my bad English, I am German.

Werner

Many of you are concentrating on finding the perfect "killer" indicators. Maybe you should be looking for the "killer" issues?

I have often found that the candidates for these good issues are those that I'll call "cyclic": i.e., they go up and down frequently either during the day or over a few days or weeks. Today's markets should be full of them.

So here's the request. Tell us what issues you are currently finding predictable. If you haven't built a good model yet, at least contribute by telling the rest of us what issues you have found that appear to be "cyclic" recently, and preferably not being driven by strong news related to that issue. Those become candidates for our models. Furthermore, tell whether this cyclic motion appears in daily bars or hourly and smaller in intraday charts. Post on this thread.

There are so many issues out there to search that everyone can be a positive contributor, even if you just got the Trader and haven't even learned it yet. How about it?

I'll start off: I have been concentrating lately on Boise Cascade (BCC), both daily and half-hour bars. I have made money in the past with this stock using nets, and another reason it may be good now is that the price is low enough that you can purchase a big block without going to options. But I know there are better candidates out there than BCC. What do YOU like?

Re: What issue to pick?

Whoops! Actually both Hurst Significance and Hurst Exponent are in our Advanced Indicator Set 1 add-on. That fact never made it to our web page description of that add-on. Sorry, we'll fix that.

In my opinion, issues are only predictable to some extend, if their changes in price are not random. Exactly this is claimed (since most statistical concepts need normal/near normal distribution of data) by the academics, and they are right - sometimes.

Technical analysis, it does not matter what kind, needs dependencies in price changes of the data. Academics say, since markets are efficient (this assumption is NOT always correct), such inefficiencies do not exist. - This is wrong - sometimes.

The best way to find out whether an issue is exploitable with technical analysis (neural nets or simple machanical models or whatever) is to use a concept called "Hurst Exponent" to measure the fractal dimension of the data. Sounds rather scientific, but is easy to handle. You just need someone how gives you access to an ad-on that calculates the Hurst-Exponent of you data. The Hurst exponents returns values between 0 and 1.

Let´s come to the interesting part now: Prices changes are not either random or dependent. They can also be in between of the two poles. You can determine a trigger level of dependence in the data, necessary for your system to be able to deal with the data.

For the beginning you should just read about the Hurst exponent. Skip the formulas if you are not intersted in them and try to understand the basic concept. Then you do not need to search for the right issue. Hurst will tell you which is exploitable. Then you should start your individual technical analysis, not before.

By the way: Since I am no a programmer I am looking for an Hurst exponent ad-on for NSTrd Pro. The fractal dimension indicator of one of the ad-on products does not calculate the hurst exponent. - If someone has a solution - please contact me on the forum.

Ah - excuse my bad English, I am German.

I just spent the weekend trying to answer this question. My focus is for a short list of stocks that will be good for 3 to 10 day trades. I decided to screen for several different criteria using ATRs and average % change in the daily range together with alpha and beta calculations and the Gapo Index (in TASC 1/01). I took highest 10 from each of the separate calculations out of 2000 stocks and then tested them on a nn 5 day prediciton of open. Here is the list I found to be the best:

SEBL, BEAS, CHKP, IDPH, RATL, SANM, EMC, MRNX, RFMD, EMLX, NEWP, PWER, ELNT, MANU, SDLI, DIGL, ITWO, MEDX, QLGC, AMCC

My net is producing about 100% per year on two one year walk forward tests. But this is condiderable less than the average return during the training/optimizing period. I am not sure how to know whether I have over curve fitted the model.

I am intested in learning more about the Hurst indicator as a way to find good trading stocks. Where is this indicator found?

Rich:

Nice job! I was hoping this thread wouldn't die out. I'm looking forward to trying some of these, and I hope more of you will submit some more candidates.

It is perfectly normal for the training/optimization period to do much better than the out-of-sample periods. There will always be fitting during optimization or net training, but since you also did pretty well out of sample and your model carried on for the next two years, I wouldn't call it OVERfitting.

By the way, for those who didn't see it, the description of how to build Gapo in NeuroShell is on p57 of that issue, and/or you can get an example on this site under the section "Traders Tips from Technical Analysis of Stocks and Commodities Magazine".

Below are the references we used when making the Hurst indicators in our Advanced Indicator Set 1 Addon (see the Addons section of www.neuroshell.com). Also see my post on this thread on 11/01/00.

Re: What issue to pick?

Date :1/29/2001 3:13:43 PM Poster : Ergo Mann

As a response to Steve's thread I decided to set myself the challenge of adapting my process to US stocks. I apologize of the long post and hope this helps others.

Since the initial post I have downloaded from Yahoo Finance various US stock data. End of day data, as Tom has mentioned, is available including the Dow Jones Industrial back to 1929.

As an aside I use the Dow from January 1929 test how I would need to adapt models over a (very) long period. Do note that the data includes Saturday trading dates, which affects models using weekly data sets. A charting package may handle Saturday data as included in the prior or latter week.

The exercise has been of enormous benefit as it has led me to produce neural networks (Predictions) that consistently generates positive Correlation (r) and R-squared. Prior to the exercise I would generate these in a haphazard fashion. Now I am able to generate positive signals on virtually all securities to which I apply the system.
I have regarded the attainment, on a consistent basis, of positive correlation and r-squared as the measure of my effectiveness and progress in utilizing NeuroShell Trader.

The models all use five-year training periods and three-year evaluations plus two walk-forwards of one year and two optimal walk-forwards.

When applied to Johnson & Johnson: JNJ the following neural network (Prediction) results were produced:

Input State Date: 1997/05/28: Input End Date: 1999/05/27: Output Start Date: 1997/05/29
Output End Date: 1999/05/28: Number of Bars: 500

Average Error: 82.7: Correlation (r): 0.171: R-squared: 0.0204: Mean Squared Error 70160
% Correct Sign: 53.8

Note: Correlation and R are better the closer to one they are. The Errors are something I am working on to reduce.

Applying the Prediction (Neural Network) to a Trading Strategy (Genetic Algorithm) over the period 2000/06/01 to 2001/01/26 produced the following:

Start Date: 2000/06/01: End Date: 2001/01/26: Beginning Price: 87.101: Ending Price: 91.938
Change in Price: 4.836: Percent Change in Price 5.6%: Annual Percent Change in Price: 8.4%

Return on Trades: 20.7% (15.8%): Annual Return on Trades: 31.5% (24.0%)

Return on Account: 21.3% (15.9%): Annual Return on Trades: 32.3% (24.1%)

Net Profit: $17.64 ($1579.91): Gross Profit: $28.07 ($2753.04): Gross Loss: $10.44 ($1173.13)
Ratio Gross Profit/loss: 2.69 (2.53)

Percent Profitable Trades: 75.0%: Number Trades: 8: Number of Winning Trades: 6
Number of Losing Trades: 2

Notes:
(i) I deliberately remove all data from 1999/06/01 when training the neural network to ensure that the results when applied to the more recent dates are not corrupted. You can see that a gap in the data is evident, from 1999/06/01 to 2000/05/31, this gives confidence that the network has indeed 'learned' the signals correctly.
(ii) The figures in brackets represent the Trading Strategy using an initial $10,000 with trading costs of $30 on entry and $30 on exit.
(iii) The network uses only the indicators that ship with NeuroShell Trader.

Using the same system Merck produced an 89% (73% with commissions) return over the same period and CISCO 82% (71.6% with commissions) excluding commissions. I will now seek to exploit these models in the real world.

Obviously, there is room for improvement, removal of the one-year data buffer and understanding how often models should be re-trained. I am comforted that although the sample is small the re-training looks as though it can be conducted over an extended period. I will report back.

Lastly, I have begun applying the Adaptive Net Indicators and preliminary results have been quite outstanding, I will conduct similar experiments on the same data sets and report the results.

Ergo

Your results look pretty good even though I don't understand the math functions you mentioned. Could you explain more how you used all of the old data back to 1929? I'm still learning NeuroShell but from what I already know your walk forwards don't seem like they go back that far.

Number of Losing Trades: 2

Notes:
(i) I deliberately remove all data from 1999/06/01 when training the neural network to ensure that the results when applied to the more recent dates are not corrupted. You can see that a gap in the data is evident, from 1999/06/01 to 2000/05/31, this gives confidence that the network has indeed 'learned' the signals correctly.
(ii) The figures in brackets represent the Trading Strategy using an initial $10,000 with trading costs of $30 on entry and $30 on exit.
(iii) The network uses only the indicators that ship with NeuroShell Trader.

Using the same system Merck produced an 89% (73% with commissions) return over the same period and CISCO 82% (71.6% with commissions) excluding commissions. I will now seek to exploit these models in the real world.

Obviously, there is room for improvement, removal of the one-year data buffer and understanding how often models should be re-trained. I am comforted that although the sample is small the re-training looks as though it can be conducted over an extended period. I will report back.

Lastly, I have begun applying the Adaptive Net Indicators and preliminary results have been quite outstanding, I will conduct similar experiments on the same data sets and report the results.

Here's a way almost EVERYONE out there can contribute to this forum and help everyone else.

I've noticed for years that some issues (stocks, futures, indexes, whatever) are more "predictable" at times than others. Later, they usually become unpredictable, probably based on news or other external factors difficult to capture in inputs. When they are "predictable", many different types of indicators and strategies work well. At such times, you don't need to be a rocket scientist to build good models for those issues. Many of you are concentrating on finding the perfect "killer" indicators. Maybe you should be looking for the "killer" issues?

I have often found that the candidates for these good issues are those that I'll call "cyclic": i.e., they go up and down frequently either during the day or over a few days or weeks. Today's markets should be full of them.

So here's the request. Tell us what issues you are currently finding predictable. If you haven't built a good model yet, at least contribute by telling the rest of us what issues you have found that appear to be "cyclic" recently, and preferably not being driven by strong news related to that issue. Those become candidates for our models. Furthermore, tell whether this cyclic motion appears in daily bars or hourly and smaller in intraday charts. Post on this thread.

There are so many issues out there to search that everyone can be a positive contributor, even if you just got the Trader and haven't even learned it yet. How about it?

I'll start off: I have been concentrating lately on Boise Cascade (BCC), both daily and half-hour bars. I have made money in the past with this stock using nets, and another reason it may be good now is that the price is low enough that you can purchase a big block without going to options. But I know there are better candidates out there than BCC. What do YOU like?

Real nice work! And thanks for sharing it.

On 1/29/01 3:13:43 PM Ergo Mann wrote:
As a response to Steve's thread I decided to set myself the challenge of adapting my process to US stocks. I apologize of the long post and hope this helps others.

Since the initial post I have downloaded from Yahoo Finance various US stock data. End of day data, as Tom has mentioned, is available including the Dow Jones Industrial back to 1929.

As an aside I use the Dow from January 1929 test how I would need to adapt models over a (very) long period. Do note that the data includes Saturday trading dates, which affects models using weekly data sets. A charting package may handle Saturday data as included in the prior or latter week.

The exercise has been of enormous benefit as it has led me to produce neural networks (Predictions) that consistently generates positive Correlation (r) and R-squared. Prior to the exercise I would generate these in a haphazard fashion. Now I am able to generate positive signals on virtually all securities to which I apply the system.
I have regarded the attainment, on a consistent basis, of positive correlation and r-squared as the measure of my effectiveness and progress in utilizing NeuroShell Trader.

The models all use five-year training periods and three-year evaluations plus two walk-forwards of one year and two optimal walk-forwards.

When applied to Johnson & Johnson: JNJ the following neural network (Prediction) results were produced:

Input State Date: 1997/05/28: Input End Date: 1999/05/27: Output Start Date: 1997/05/29
Output End Date: 1999/05/28: Number of Bars: 500

Average Error: 82.7: Correlation (r): 0.171: R-squared: 0.0204: Mean Squared Error 70160
% Correct Sign: 53.8

Note: Correlation and R are better the closer to one they are. The Errors are something I am working on to reduce.

Applying the Prediction (Neural Network) to a Trading Strategy (Genetic Algorithm) over the period 2000/06/01 to 2001/01/26 produced the following:

Start Date: 2000/06/01: End Date: 2001/01/26: Beginning Price: 87.101: Ending Price: 91.938
Change in Price: 4.836: Percent Change in Price 5.6%: Annual Percent Change in Price: 8.4%

Return on Trades: 20.7% (15.8%): Annual Return on Trades: 31.5% (24.0%)

Return on Account: 21.3% (15.9%): Annual Return on Trades: 32.3% (24.1%)

Net Profit: $17.64 ($1579.91): Gross Profit: $28.07 ($2753.04): Gross Loss: $10.44 ($1173.13)
Ratio Gross Profit/loss: 2.69 (2.53)

Percent Profitable Trades: 75.0%: Number Trades: 8: Number of Winning Trades: 6
Number of Losing Trades: 2

Notes:
(i) I deliberately remove all data from 1999/06/01 when training the neural network to ensure that the results when applied to the more recent dates are not corrupted. We are posting this message for a user who does not have an internet connection, but who nevertheless wanted to tell everyone what stocks he has traded with success:

I run an insurance agency and trade part time (evenings). I started trading with the NeuroShell Trader Professional at the end of January 2001, and today (April 18th) I have doubled my money with 71 trades. The best returns have been coming with the Cluster Indicators, and the others have been done with Adaptive Net Indicators. I feed momentum indicators into these. I Trade CMVT, SANM, SPOT, BBBY, and MCHP.

HAAR Wavelet Source Code

Date :11/3/2000 2:43:39 PM Poster : Ward.net Webmaster

Mr. Chu has been kind enough to send us the source code for his HAAR Wavelet function, as well as some other functions that he has written. The file can be downloaded using this link. All discussion relating to these indicators should be directed to Mr. Chu via the forum.

Re: HAAR Wavelet Source Code

Date :11/5/2000 9:55:24 AM Poster : Daniel P Lyons

Hi Victor,

solved the riddle re: crash...it was related to the number of points being passed.

Have you investigated the ATrous function at all? I would be interested in your views on this function. It would appear that it may smooth noisy data which could be used as an input to a net for attempting to predict trends.

I look forward to your response,

kind regards,

Daniel P Lyons

Hi Daniel,

I have not investigated the ATrous function as yet. I am not sure if it suffers from the end point distortion problem. If it does, then it is not suitable to be used as inputs to Neural Networks.

Re: HAAR Wavelet Source Code

Date :11/15/2000 3:45:15 AM Poster : Daniel P Lyons

Hi Victor,

thanks for the update.

I spoke to John Bonn (WaveFin) re: end point distortion who made these points for Gabor/Morlet filters. Basically, the WaveFin filters are lagged so they do not incorporate any future data. If a filter that is not lagged is used as an input then you will get end point distortion. This does not occur with WaveFin because of the lagging.

The downside to lagging the filters is the lag itself. To compensate for this
they allow the user to "tune" the lag according to their application. When you
fully lag the filters the outputs will be completely accurate. You can reduce
the lag by reducing the accuracy. There is a balance between accuracy and lag
that can be found and will be dependent on your application. Also, there are guidelines for setting parameters to reduce lag yet still retain accuracy. He felt many people focus on reducing lag in their inputs. The real measure is the
performance of the overall system (inputs and neural net). Providing a net with
accurate lagged inputs will usually result in better overall system performance.

I hope this is useful,

best regards,

Daniel

Some trade system figures that I've found important are net profit, number of trades, percentage winners, trade time span, and max drawdown. Statistically speaking, the total number of trades should exceed 30 or so for any period of time evaluated. This is to ensure that the system figures obtained is relevant in terms of statistical testing. Then, I would test the system on real-time for a few months to see whether the system conforms to the statistics obtained from evaluation period. I'd look for any deviations of real-time results and try to fine-tune the system.

This leads me to a question: In the process of developing systems, I've tried to create a prediction indicator that predicts %change in open 2 days ahead by using exactly the same input, i.e., %change in open 2 days ahead .
Since this is obviously curve-fitting, the out-of-sample results should be bad. On the contrary, my out-of-sample results are fantastic. If this is so, how much should I trust out-of-sample results?

I just used the indicator wizard. I "lead" the "% change" of open by two days.
If you try it, you will find that the actual signal matches exactly with the out-of-sample signal for the case when the output you're trying to predict is also created from the indicator wizard. If I use the default, the match is not perfect.

I've tried it for the case when there are no neurons, i.e., the linear case. I would assume that in this case, the predictor resembles a linear regression fitting. But I could not figure why the out-of-sample results are so fantastic.

Hello,

I would calculate a t-stats and its probability (significance) on the distribution of trades, and also look at serial correlation (lag=1). These are, as far as I know, basic tests for statistical stability. You can also look at confidence intervals, etc...
All these tools are available in Excel.

Thanks the Central Limit Theorem, a sample of 10 to 15 trades is usually good enough for those tests, but of course, more is better.

I usually only do it on in-sample data, but it is often advised to do it on out-of-sample data too. I believe it then becomes a bit of an overkill. In your case, I would do it though to check whether your results come from random chance.

Regards
Bruno

Hello Bruno

Thanks for the tip. In NT on-line help, it is advised that input for prediction analysis
should not include leading indicators. Only lagged inputs should be used. I do not
know the reason why and I hope someone can answer.

Do you carry out real-time testing? There are two methods that I use. One is to train
the historical data up to present and then update data daily without retraining to see
how the system performs. The other is to use train the historical data for the past few
years and then update the historical data to present to test the system. Each has its own
merits but I find that the latter saves more time. Do you subscribe to any of the above?

Regards, James

Hello,

I would calculate a t-stats and its probability (significance) on the distribution of trades, and also look at serial correlation (lag=1). These are, as far as I know, basic tests for statistical stability. You can also look at confidence intervals, etc...
All these tools are available in Excel.

Thanks the Central Limit Theorem, a sample of 10 to 15 trades is usually good enough for those tests, but of course, more is better.

I usually only do it on in-sample data, but it is often advised to do it on out-of-sample data too. I believe it then becomes a bit of an overkill. In your case, I would do it though to check whether your results come from random chance.

Regards
Bruno

Hello James,

My english is sometimes 'approximate'. NN inputs should never look in the future. In economics, one often talks of leading indicators, simply because they do carry some predictive value, so that's is the way I interpret the word 'leading'. On the other hand, a lagged value is a past value for an indicator which would not have such predictive characteristic.

Your other question is a matter for debate. My feeling is that if you have enough coherent data, i.e. reflecting a consistent maket behaviour, you can use walk-forward testing. This is the way NSTrader should be normally used. If not you can then train up to present, but you have no real indication of generalization, and you will be tempted to retrain your net periodically. A lot of traders do that, even though it is not a sound practice in theory. Personally, I like using the Adaptive Nets up to present, and then looking at the statistical distribution of trades for clues about system stability. I would like to know what other users are doing.

Regards
Bruno

Hi James,

It seems to me that if you use %change in open 2 days ahead as an input to a net that is trying to solve for %change in open 2 days ahead...you are giving it the answer. So I would expect it to have "fantastic" out of sample results. See what I mean? It's like having a crystal ball to see into the future! Or taking an exam with a 'cheat sheet'.

If you look at the Input contributions I'm fairly certain that you'd find that the '%change in open 2 days ahead' input would have a value at or near 100%. So even with out of sample data you are still feeding it 'the answer'.

Hi Randy,

I follow your logic. That does explain the out of sample results. Thanks. I just tried it out for fun to see how a 'perfect prediction' would look like. Does that mean that following such reasoning, any 'leading indicator' used as inputs to NN
will mean sneak peeking into the future? Do you use any leading inputs?

Regards, James

I think the best way to think about the 'leading indicator' issue is to ask whether or not that data would be available after all the backtesting is finished and you are actually trading off the signals in your net. Obviously if you are using tomorrow's close as an input to a net that tries to predict tomorrow's close, you won't have that input available until after tomorrow's close - so it wouldn't be useable (because it wouldn't be available).

Also (you're probably aware of this but just in case...), a leading indicator (or coincident indicator or lagging indicator) as used by economists (like, for example, money supply or index of new housing permits, etc.) is not the same as an indicator in the trader that has a 'lead' applied to it. Some people use economic leading indicators because of a belief that a correlation may exist betweeni, say, a contraction in money supply and a future slowdown in economic activity.

No, I don't use leads as inputs for obvious reasons but I sometimes use the lead of a graph to shift it to the left on the chart because I like to look at the charts. Sometimes I can get ideas for new inputs or even trading strategies by employing the flexibility that the trader gives me to view graphs with leads and lags. In the old days (before the trader) you used to have to 'lead' whatever it was that you were trying to predict by the number of periods ahead that you wanted to predict it. Now the trader takes care of those types of mundane details.

I hope this helps...

Randy

Thanks for your input. BTW, how do you lead the graph? I mean, what is the parameter that represents the graph?

Since I am the originator of this question and got the answers, I feel obliged to summarize it. Comments on flaws in the reasoning (if any) is appreciated. As I now see it, leading an indicator in the context of neural networks means shifting the price series to the left. For example, if we have a price series (x1, x2, x3, x4, x5, x6, x7, x8, x9, x10), we may shift the series to the left to make it a leading input to train the network. Say, a lead of one period will shift the price series to the left by one step. In this case, we use input x2 to train the network to predict price x1, x3 to predict x2, and so on.

x1, x2, x3, x4, x5, x6, x7, x8, x9, x10 original price series
x2, x3, x4, x5, x6, x7, x8, x9, x10, x11 price series lead by 1 period

The problem with using a leading input is that we require x11 to predict x10. And x11 is the future price that we do not know in advance.

Thanks for all your responses.

Hi Jim,

By "graph" I meant anything you can put in a chart (existing data/calculations, indicator, other instrument data, predictions, trading strategies). To answer your question, the parameter that represents the graph is called the Time Series in the indicator wizard. It works the same way in both the lead indicator and the lag indicator except that the lead shifts the 'graph' left and the lag shifts it right.

Upon further reflection I realized that I rarely use the lead indicator anymore...unless I'm just playing around and trying to visualize 'what-if' scenarios.

On 12/8/00 12:57:56 PM James wrote:

Hello Bruno

Thanks for the tip. In NT on-line help, it is advised that input for prediction analysis should not include leading indicators. Only lagged inputs should be used. I do not know the reason why and I hope someone can answer.

Do you carry out real-time testing? There are two methods that I use. One is to train the historical data up to present and then update data daily without retraining to see how the system performs. The other is to use train the historical data for the past few years and then update the historical data to present to test the system. Each has its own merits but I find that the latter saves more time. Do you subscribe to any of the above?

Hello,

I would calculate a t-stats and its probability (significance) on the distribution of trades, and also look at serial correlation (lag=1). These are, as far as I know, basic tests for statistical stability. You can also look at confidence intervals, etc...
All these tools are available in Excel.

Thanks the Central Limit Theorem, a sample of 10 to 15 trades is usually good enough for those tests, but of course, more is better.

I usually only do it on in-sample data, but it is often advised to do it on out-of-sample data too. I believe it then becomes a bit of an overkill. In your case, I would do it though to check whether your results come from random chance.

On 12/9/00 6:59:33 AM Randy Brown wrote:
Hi Jim,

By "graph" I meant anything you can put in a chart (existing data/calculations, indicator, other instrument data, predictions, trading strategies). To answer your question, the parameter that represents the graph is called the Time Series in the indicator wizard. It works the same way in both the lead indicator and the lag indicator except that the lead shifts the 'graph' left and the lag shifts it right.

Upon further reflection I realized that I rarely use the lead indicator anymore...unless I'm just playing around and trying to visualize 'what-if' scenarios.

On 12/8/00 12:57:56 PM James wrote:
Thanks for your input. BTW, how do you lead the graph? I mean, what is the parameter that represents the graph?

Since I am the originator of this question and got the answers, I feel obliged to summarize it. Comments on flaws in the reasoning (if any) is appreciated. As I now see it, leading an indicator in the context of neural networks means shifting the price series to the left. For example, if we have a price series (x1, x2, x3, x4, x5, x6, x7, x8, x9, x10), we may shift the series to the left to make it a leading input to train the network. Say, a lead of one period will shift the price series to the left by one step. In this case, we use input x2 to train the network to predict price x1, x3 to predict x2, and so on.

x1, x2, x3, x4, x5, x6, x7, x8, x9, x10 original price series
x2, x3, x4, x5, x6, x7, x8, x9, x10, x11 price series lead by 1 period

The problem with using a leading input is that we require x11 to predict x10. And x11 is the future price that we do not know in advance.

Thanks for all your responses.

On 12/7/00 4:13:19 PM Randy Brown wrote:
I think the best way to think about the 'leading indicator' issue is to ask whether or not that data would be available after all the backtesting is finished and you are actually trading off the signals in your net. Obviously if you are using tomorrow's close as an input to a net that tries to predict tomorrow's close, you won't have that input available until after tomorrow's close - so it wouldn't be useable (because it wouldn't be available).

Also (you're probably aware of this but just in case...), a leading indicator (or coincident indicator or lagging indicator) as used by economists (like, for example, money supply or index of new housing permits, etc.) is not the same as an indicator in the trader that has a 'lead' applied to it. Some people use economic leading indicators because of a belief that a correlation may exist between, say, a contraction in money supply and a future slowdown in economic activity.

No, I don't use leads as inputs for obvious reasons but I sometimes use the lead of a graph to shift it to the left on the chart because I like to look at the charts. Sometimes I can get ideas for new inputs or even trading strategies by employing the flexibility that the trader gives me to view graphs with leads and lags. In the old days (before the trader) you used to have to 'lead' whatever it was that you were trying to predict by the number of periods ahead that you wanted to predict it. Now the trader takes care of those types of mundane details.

I hope this helps...

Randy

Well, I believe in the sixth Commandment of Non-linear Modeling and Neural Nets (see Tips and Techniques on this site for all commandments):

6. Thou shalt not apply statistical measures and precision to financial modeling.

The reason is that I think the myriad of elusive and changing variables that drive the markets means that good market models often don't last long enough for statistics to be applicable. There are many who make money on models that do not meet scientific standards.

So here is my favorite procedure:

1. Use an out-of-sample (evaluation) period of 3 to 12 months.
2. Screen for profit exceeding buy and hold, which is not hard in today's US markets.
3. Then "eyeball" the out-of-sample buy/sell signals to see if generally the model gave buy signals near the valleys and sell signals near the peaks. Make sure the profit wasn't made on only one long trend, and that there weren't any bad drawdowns.
4. If the model passes the fuzzy eyeball test, go with it. Remember, you are looking for a great edge, not the Holy Grail.
5. Diversify your funds into several such models on different issues.
6. After a while, your models may deteriorate as market conditions change, so keep working on new models to replace them.

However, for those who feel more comfortable with more formal analysis, there have certainly been some good ideas on this forum, and not just in this thread.

I subtract six to nine months worth of historial information from the data file and build my network using the remainder.

The out-sample would be, say, the nine months prior to March 2000 in this example.
If the out-of-sample looks successful I then re-introduce the 'saved' data in three monthly stages.

If this is achieves positive results I will then trade the model using the 'panel' system.

This gives me the greatest confidence when/if the model trades successfully, that the next signal will be valid.

One last wrinkle is that I have a Mechanical Trading System based on a technical analysis package and I look for complimentary signals between NeuroShell Trader and the MTS.

This seems to work and is not as long winded as it might appear.

Input selection

Date :12/7/2000 8:15:09 PM Poster : Zocker

I would like to start a little discussion about input selection.

1) What is your technique for building a net? Do you build the nets on a trial and error base, or according to the "picture" how the stocks graph looks, or any other technical or psychological aspects?
2) In which form do you use these inputs? The inputs can be in raw form, as change, or in normalized data. For example: a moving average is the raw form, a change over a period of time creates an oscillator, and the sinus from this created oscillator normalizes it in a certain range.
3) How do you classify good and bad inputs? I made the experience that when I delete the best inputs found in the optimization the results getting better and wise versa by deleting the worse inputs the nets getting worse after retraining.
4) Do you build only one network for one issue or do you build multiple networks from different inputs? In case of multiple networks do you treat the results separate or do you build in addition a "overall network" from the results off the previous ones?

Thanks a lot for your time. I wish you a great and successful day.
Zocker

Re: Input selection

Date :12/9/2000 1:40:26 PM Poster : James

I'll try to answer your questions in general. I usually select my inputs by trial-and-error as well as to source for ideas from books, magazines and journals. I do not need to understand the mechanics of the system in detail as the net may or may not work in the market I'm trading. But if I do hit a jackpot, then I'll narrow down my focus and trying to understand everything about it.

I do not know if this is helpful but I always thought of the net as an equation similar to the moving average formula. In the latter, a price series goes in and some numbers come out called the moving average. In the same way, the net is an equation that processes some inputs to produce an output. Thinking it this way helps me to relief some of my phobia about nets.

NYSE Uptick Rule

Date :12/8/2000 3:53:47 PM Poster : Vince Notardonato

As anyone had an idea on how to get around the NYSE uptick rule for Selling Short?
Thanks

Re: NYSE Uptick Rule

Date :12/9/2000 5:48:22 AM Poster : Nicka

One traditional way is by 'boxing'. It requires two accounts you simultaneously buy long in one short in the other this can be done on any uptick. When you want to take a short position you simply close the long.

Cheers!
Nick

On 12/8/00 3:53:47 PM Vince Notardonato wrote:

Re: NYSE Uptick Rule

Date :12/9/2000 7:02:31 AM Poster : Randy Brown

You could try Spyders for the Dow Jones Industrial Average (DIA), Nasdaq 100 (QQQ), S&P500 (SPY) and a Mid cap index (MDY), all of which are traded on the Amex and are exempt from the uptick rule on short sales. I think there are a lot of newer ones lately as well...check the amex website.

Normalisation

Date :12/9/2000 6:13:04 AM Poster : Nick

Any tips for effective normalisation ? I feel that it may be as important as the model itself. I have tried simple differences and percentage changes. Do you normalise all imputs ? Inputs and Outputs? I guess the object is to detrend the data (leaving something like Steves ideal range bound issues) and add the trend back in right at the end. I have tried stochastics in the past with not that much success any thoughts welcome.

Cheers!
Nick.

Bruno Voisin – t-stat & serial correlation

Date :12/11/2000 8:23:31 AM Poster : Jacobs

I think it´s an important issue, stability or the probability of a random event, and would like to know more about how you perform these tests.
Is it possible for you to give a simple example showing the procedure?

Re: Bruno Voisin – t-stat & serial correlation

Date :12/12/2000 11:56:59 PM Poster : Bruno

Hi,
I am a big Excel fan, and I do most of my tests there. Obviously, it is better to have a good knowledge of statistics, but one can get away with some basics.

In a nutshell, the idea is to take your distribution of trades as a population, on which you calculate the mean trade and the standard deviation. The "t-stat" is basically a technique to compare the characteristics of two distributions, this time the trades distribution with a distribution of no profitability. So, to make it short, you divide the sample mean by its standard deviation to get the t-stat. You then get the probability, i.e. significance using the TDIST Excel function with a number of "degrees of freedom" equal to the number of trades minus one. That number is in a way a probability of results occuring out of random chance, therefore, lower is better.

Another important test is the serial correlation of trades, which can plague any statistical test. It is again quite easy to do in Excel, and the result must obviously be as little as possible.

There is also the calculation of confidence intervals to check the probability of trades within a range around the mean (CRITBINOM function). It is a good test to gauge the impact of outliers.

All this (and more) can be done on in-sample and out-of-sample data. I usually do it on in-sample. I actually would appreciate the view of a qualified statistician on this.

Testing time series distribution is quite complex anyway. And there's only so much one can do to build stable systems. You can also try to apply similar techniques to see how close your in-sample and out-of-sample distributions are really.

I hope this helps a bit,

Bruno Voisin
ForeTrade

Re: Ergo Mann – old approach

Date :12/20/2000 7:57:02 AM Poster : Ergo Mann

I am impressed that you included my nom de plume in the subject heading else I really would not have spotted it.

I read this yesterday morning, 19 December and was a bit taken aback by your question.

I log onto the forum once a week just to get a feel of what is discussed.

The initial response from my October article was not positve so I thought I had better keep quiet. I do wish though that this forum were available when I first bought NeuroShell Trader as I may have reached this point sooner.

At the end of the first year I went back to the book that made me purchase NST from Ward, Neural Networks for Financial Forecasting - Edward Gately. This helped me enormously as Gately is very disciplined and I believe you need to adapt his actions to suit NST (the program he used in the book works slightly differently to NST providing actual levels the underlying security is will reach).
Gately's book covers input selection, preparing and manipulating data, through to training and developing a forecast for the S&P.

In the past year another book The Predictors - Thomas A Bass has helped me as well, though unlike Gately this is a more general overview of the subject rather than specifics in generating a working network. This trend of generality is what I pursue here.

It would be easy for me to say do this or that and I am sure many here will vehemently disagree. I wish to avoid that. NST is a very complex program with numerous subtleties that lead to useful or poor models. I do not profess to know all of them, though some are strikingly obvious when pointed out.

(i) I am reluctant to give away my own system (ii) I firmly believe that with the aid of these two books you will form a strict method of interrogating NST leading to improved models.

>The initial response from my October article was not positve so I thought I had better keep quiet.

I'm glad you're back. I thought your Oct posting was excellent. Everyone has to remember that this business is an art, not a science, and therefore it is difficult to label any approach as "right" or "wrong". Some strategies will be profitable for some people on some issues at some times, and some will be profitable for other people on their issues at other times. Even the notion of "profitable" is subjective. I have watched some very successful traders get that way, and I assure you that no two are doing the same thing. This forum is getting better every day because more of you are sharing your ideas, all of which will probably appeal to someone sooner or later.

Evaluate a model – me?

Date :12/11/2000 1:00:19 PM Poster : Jacobs

How do you do it, with some kind of confidence, in a near random market , not accepting/using a false model.

Assume we have an issue that have an equal chance of goinf up or down. Maybee the real chance is 50-51% of going up (as an average). One year has about 250 trading days.
The probability that x predictions are correct is (250 x)*0.5^power(x)*0.5^power(250-x) [binomial distribution]
If we find that 135 days are correct(135/250 = 0.54 =54%) we get a probability of 0.092 = 9.2%
Thus we are running a 9% risk of classifying the random model as a useful predictive model.

Assume we are evaluating indicators producing buy and sell signals at an average rate of once a week.
We have selected 100 different indicators and want to decide if any of them has predictive power – which we define as beeing correct more than 55%.
Our testperiod is 10 years = 50*10 signals from each. What´s the probability a random indicator slips through?
Using the same formula we get a probability of 1.12%
But the probability that any of the hundred is passing the test is 1-(1-0.0112)^power(100) and that´s 68%

I think it´s important to have figures of this kind as a background.

Frankly - I don´t know how to evaluate a model in NST.
But I want at least three things (my first level list) from my model.

1.) Performance is better than Buy & Hold. - What two figures do you compare?!
2.) Low probability that the result is obtained by chance. - At least a figure reflecting this.
3.) High probability that the performance will repeat itself in the (near) future (assuming a stedy-state market!? no reports/no recommendations/no new orders etc.……) . and a figure reflecting this probability.

Who want´s to use a model that is worse than Buy&Hold?

#1 and #2 I guess will be found somewhere among the statistics in NST – but where?

When evaluating #1 (searching for a probability measure) you also have to include number of trades, number of succesful trades, how the profit was made - many small sucessful trades or just one or a few jackpots. It should be possible to obtain a figure for this, assuming something …..maybe a gaussian distribution –or something like that? Bootstrap method??(not much experience of this myself but heard of it)

To evaluate #3 I think the result of these walk-forwards might be used. (or the length of the out of sample period, might be understand as the number (or ratio) of sucessful trades?) But how? Bootstrap again???

In the end (I know) , it´s me that decides what "low" and "high" means and also if the market will be in a "steady-state" and all the other assumptions.
But I want some figure reflecting this. Is it possible to get this? A relative figure is enough.
With a figure I´m able to choose among different models otherwise……yes what?

What things do you want from your models? And how do you decide if these goals are met?
Any view is appreciated!

Re: Evaluate a model – me?

Date :12/11/2000 4:43:27 PM Poster : Cantley

One of the things that has always concerned me is the way it's so easy to operate in a manner such that your out of sample isn't really out of sample anymore.

You run ideas until you get an out of sample test that's adequate. Do you have a good model, or have you fiddled so much that you've found a good model for the out of sample period you're using?

Circles within circles within circles...

Steve

On 12/11/00 1:00:19 PM Jacobs wrote:
How do you do it, with some kind of confidence, in a near random market , not accepting/using a false model.

Assume we have an issue that have an equal chance of goinf up or down. Maybee the real chance is 50-51% of going up (as an average). One year has about 250 trading days.
The probability that x predictions are correct is (250 x)*0.5^power(x)*0.5^power(250-x) [binomial distribution]
If we find that 135 days are correct(135/250 = 0.54 =54%) we get a probability of 0.092 = 9.2%
Thus we are running a 9% risk of classifying the random model as a useful predictive model.

Assume we are evaluating indicators producing buy and sell signals at an average rate of once a week.
We have selected 100 different indicators and want to decide if any of them has predictive power – which we define as beeing correct more than 55%.
Our testperiod is 10 years = 50*10 signals from each. What´s the probability a random indicator slips through?
Using the same formula we get a probability of 1.12%
But the probability that any of the hundred is passing the test is 1-(1-0.0112)^power(100) and that´s 68%

I think it´s important to have figures of this kind as a background.

Frankly - I don´t know how to evaluate a model in NST.
But I want at least three things (my first level list) from my model.

1.) Performance is better than Buy & Hold. - What two figures do you compare?!
2.) Low probability that the result is obtained by chance. - At least a figure reflecting this.
3.) High probability that the performance will repeat itself in the (near) future (assuming a stedy-state market!? no reports/no recommendations/no new orders etc.……) . and a figure reflecting this probability.

Who want´s to use a model that is worse than Buy&Hold?

#1 and #2 I guess will be found somewhere among the statistics in NST – but where?

When evaluating #1 (searching for a probability measure) you also have to include number of trades, number of succesful trades, how the profit was made - many small sucessful trades or just one or a few jackpots. It should be possible to obtain a figure for this, assuming something …..maybe a gaussian distribution –or something like that? Bootstrap method??(not much experience of this myself but heard of it)

To evaluate #3 I think the result of these walk-forwards might be used. (or the length of the out of sample period, might be understand as the number (or ratio) of sucessful trades?) But how? Bootstrap again???

In the end (I know) , it´s me that decides what "low" and "high" means and also if the market will be in a "steady-state" and all the other assumptions.
But I want some figure reflecting this. Is it possible to get this? A relative figure is enough.
With a figure I´m able to choose among different models otherwise……yes what?

What things do you want from your models? And how do you decide if these goals are met?
Any view is appreciated!

Re: Evaluate a model – me?

Date :12/13/2000 3:50:16 AM Poster : James

For #1, the figures can be obtained from the trading strategy statistics under beginning and end prices.

For the rest, I think all these tests that you suggested can be implemented into NT through it's dll capability.
For example, programming the binomial distribution should be quite simple and you can use as inputs,
indicators that are available from the indicator wizard under system positions.

For example, I've programmed a simple indicator that measures the system drawdown using the r-squared coefficient
of linear regression (r-squared = 1 represents an ideal system with no drawdown) . Such information is not
readily available in the indicator wizard. Another is an indicator that displays a histogram/distribution of any

variable.

The only thing I have not managed to do though is to scale the x-axis to display the value of the variable
that I want. The x-axis always displays the dates of the price curve.

Not sure exactly what you are doing, but there are two r-squared indicators in the Regression category that might be helpful. For building histograms, the Data Exchange Add-on might be useful since you can program any type of display with it that has access to Trader data streams.

Re: Evaluate a model – me?

Date :12/13/2000 10:47:36 AM Poster : James

My aim is to fit the whole time series. I believe the indicators that come with NT can also do this but not as readily as what
I aim to do. In this case, I do not have to deal with the regression period.

>1.) Performance is better than Buy & Hold. - What two figures do you compare?!

First modify the Trading Strategy and select either the "Optimal" period or the "Current" (backtest) period if you optimized. Then press the Detailed Analysis button and look at "Change in Price", "Percent Change in Price" and "Annual Percent Change in Price". Those are buy and hold. Compare them to the stats below called "Net Profit", "Return on Trades", or "Annual Return on Trades". Here is a picture of the statistics as they appear:

STOCK PICKS

Date :12/14/2000 10:05:04 AM Poster : Vince

I am relatively new at using the Day Trader and I am still trying to decide how to make a stock selection.
There are so many stocks on the NYSE, I believe 3900 and of course I cannot
trade them all.
Does anyone have any idea on how to narrow them down to a manageable number?
Do I keep the same stock all the time and run an optimization maybe once a week or do I come up with a new list of stocks every night for the following day?
In either case which ones are the best candidates?
If someone can give some help I would really appreciate it.

Thanks

Vince

Re: STOCK PICKS

Date :12/18/2000 2:31:32 AM Poster : SM

For picking stocks to day trade I rely mainly on the news and staying
with one sector works well too.

Scan the typical sites Bloomberg, Quote.com, etc. before the market opens.
Check out the conference calls for the prior and current day
on Quote.com (under earnings calendar) these seem to add to intra-day
volatility. Of course, if your model goes bearish make sure that stock
is shortable.

For intra-day trading make sure the prices are well supported on both sides
with the level II data. I like to see at least 150,000 shares traded within the
first half hour. For day trading volatility and liquidity are very important. That narrows the field of "tradable" stocks down dramatically. The number of new stocks you look at will be a function of time you have to have to evaluate them.

Happy Trading

Automated trading

Date :12/18/2000 2:43:08 AM Poster : SM

I have been working on a trading server that will (via the DataX api) interface with the myTrack on-line brokerage SDK. Is anyone else working on something like this?

Are there any other brokerages that provide SDKs for doing automated transactions?

Re: Automated trading

Date :12/18/2000 2:50:20 PM Poster : Michael Stigall

TradeStation has an interface on their alerts which can place automated trades with 3-4 brokerages (I use ETrade, and its one of them). The interface itself is not smart enough to cancel an existing order, so you are required to manually kill any existing order first on the same lot, or write some EasyLanguage code to handle more complex situations.

On 12/18/00 2:43:08 AM SM wrote:

Trading UK Markets or other non US/Canadian Markets

Date :12/19/2000 8:22:25 AM Poster : John Hegarty

I am new to Trader and am interested in trading UK equities. I would be interested in other's experiences of using Neuroshell Trader in this or other non US/Canadian markets.

I don't believe that that there is a multicurrency capability and I assume that using the numerical of a UK Sterling price will be fine and that I can convert date formats as required.

In terms of UK data sources I have yet to select a vendor and I am considering Market Eye and ADVFN as cost effective sources of historic and daily data (downloaded over an internet ADSL). I have not properly considered Quote.com, but from a quick look at their UK site they appear considerably more expensive than both the domestic UK competition and in comparison to their US pricing. I'd welcome any views on suitability/experiences/implementation of these vendors or on alternatives.

If any one has other UK customisation or market experience they can share then this would be most welcome.

Thanks

John

Re: Trading UK Markets or other non US/Canadian Markets

Date :12/20/2000 8:15:02 AM Poster : Ergo Mann

John

I trade the UK markets and use NST to track the UK traded options stocks as well as the indices of the UK, US, Japan and Germany.

I do not get hung up on the '$' signs in the package it really is not a big deal. Though the way the data is constructed for the trading packages I use does obviate some functionality.
For example, the Royal Bank of Scotland's data will say 1494.5 for £14.9450; I feed 1494.5 into NST.
The US data I receive will already have the data in the correct dollar and cents configuration, that is, $30.625 for BCC etc.,

End-of-Day Data
I use a text file of UK stock and indices with a down-load of end-of -day indices from a reliable source on the Internet. I have an Excel worksheet that appends the data to the bottom of the '. CSV' file. The help file in NST is extremely good at pointing out the various options including a fantastic selection of date options.

Intra-Day Data
For £7 a month Sky Digital gives you access to Sky Text which gives you tick-by-tick data for the major indices, including FT-SE, NASDAQ, DOW, DAX etc.,
This is the most cost-effective method, though I agree Market-Eye and Prestel are good alternatives, though perhaps not as cheap.

Try using a Point Value of .01, so a value of 1494.5 can be turned into $14.945 in the trading reports. However it should be noted that point value applies across all chart pages, so care should be taken when using point value on charts with multiple chart pages.

Date :12/28/2000 7:28:13 AM Poster : Floating Bear

Don't bother.
The UK market is far less volatile than those in the US.
There is a UK tax (stamp duty) of .5% payable on all purchases.
Brokers costs are far higher (lowest is about £10)
Research material is less widely available.

CSV' file. The help file in NST is extremely good at pointing out the various options including a fantastic selection of date options.

Intra-Day Data
For £7 a month Sky Digital gives you access to Sky Text which gives you tick-by-tick data for the major indices, including FT-SE, NASDAQ, DOW, DAX etc.,
This is the most cost-effective method, though I agree Market-Eye and Prestel are good alternatives, though perhaps not as cheap.

Ergo

I am new to Trader and am interested in trading UK equities. I would be interested in other's experiences of using Neuroshell Trader in this or other non US/Canadian markets.

I don't believe that that there is a multicurrency capability and I assume that using the numerical of a UK Sterling price will be fine and that I can convert date formats as required.

In terms of UK data sources I have yet to select a vendor and I am considering Market Eye and ADVFN as cost effective sources of historic and daily data (downloaded over an internet ADSL). I have not properly considered Quote.com, but from a quick look at their UK site they appear considerably more expensive than both the domestic UK competition and in comparison to their US pricing. I'd welcome any views on suitability/experiences/implementation of these vendors or on alternatives.

If any one has other UK customisation or market experience they can share then this would be most welcome.

Thanks

John

John,

I'm trading the French and UK markets and know that Quote.com is fine for my US trading but does not presently have any European markets. For these I use Dialdata for EOD. It's OK but there are quite a few problems of data quality.

If you find any European based data suppliers please let me know, the problem being the need to feed in seamlessly into NST.

Regards,

Maciej

You can use for EOD data on the French market www.netbrokers.fr, Swiss market www.quoteline.ch, Italian www.clubdiborsa.com.

Hi,
I am also using trader for the UK market. I use Investorease to import data into Trader . It costs me nothing.

e-mini

Date :12/30/2000 8:35:13 AM Poster : Maxwell Craven

I've seen mention of e-minis on this forum. Can someone please explain them? Can I access them on Quote.com?

Re: e-mini

Date :12/31/2000 7:57:38 PM Poster : JM

Hi Maxwell,

E-minis are mini contracts of their bigger counterparts that are traded on the CME. Eg, there is the e-mini S&P, which is only 1/5 times of the 'big' S&P contract, ie, 1 full point of the S&P is $250 but 1 full point of the e-mini S&P is only $50. Another difference between the e-mini contracts and their big brother is the tick size and the medium used for trading them. For the full S&P, minimum tick size is 0.1 while the e-mini S&P is 0.25. During the regular trading hours, the full S&P is traded on the open-outcry pit of the CME, while the e-mini S&P is strictly an electronic creature.
There are other e-mini contracts traded on the CME as well, most notably the e-mini Nasdaq and the e-mini currencies. You may wish to check out their specs in www.cme.com. Something else I find about the e-mini contract is that alot of brokers actually offer lower comission if you trade the e-mini S&P, though not sure if they do the same for the other e-mini contracts. And of course, the margin for the e-mini contracts are much smaller. One more thing I experienced while trading the e-mini S&P is that it tends to swing more wildly than its big brother, maybe because of the lower point value and the bigger tick size. Hope this helps.

JM

Thanks, JM, that explanation and the CME web site helps me quite a bit. Your observation that the e-mini S&P swings more wildly than its big brother makes me wonder if it is the kind of candidate Steve Ward talked about in his post. Have you found that these swings lead to profitable trading systems?

Re: e-mini

Date :1/2/2001 3:46:30 AM Poster : JM

Hi Maxwell,

When I wrote the e-mini S&P swings wildly, you can read that as 'erratic'. It is by no means easy to predict the S&P, but I find predicting the e-mini S&P a bit more difficult because of those wild swings. The big S&P, though by no means a tame creature, behaves somewhat more orderly when compared to his smaller brother. The big S&P do make wild swings too, and definitely offer anyone with a good model the opportunity to profit from it, provided you have the stomach to face this king of the beast. As for me, I only dare to take on the e-mini, and even then, it is with respect that I enter its electronic pit. I do not have much success building a good intraday model for the e-mini, but I am still trying. I find predicting and trading the US bonds less stressful. You might want to ask the other more experienced traders in this group (believe me, there are some really experienced and successful guys here) to give you some pointers in trading and predicting the S&P and the e-mini S&P. Good trading.

Let me toss a thought into the discussion: switch-trading Rydex mutual funds.

Rydex (www.rydexfunds.com) has a family of no-load, low-management-fee mutual funds that track the S&P500 Index in various multiples of the S&P 500 performance. While lacking the high leverage of trading the S&P directly, these (what they call) "dynamic funds" can be switched-traded twice per day. They include: Nova at 150%, Titan at 200%, Ursa at -100%, TEMPEST at -200% and, of course, a money fund.

We're currently backtesting several S&P500 trading systems, developed using NS Trader Professional, utilizing Rydex to switch-trade based on a panel of experts "opinion" on the direction of the S&P 500:
Strong Buy Long Opinion ==> Titan
Buy Long Opinion ==> Nova
(...not 100% of S&P500, but trading Nova/Ursa ratios is too much hassle)
No Opinion ==> MM
Sell Short Opinion ==> Ursa
Strong Sell Short Opinion ==> TEMPEST

2x to -2x leverage may be too weak for some traders relative to trading the index directly, but might be suitable for some IRA, 401K, etc accounts. You need $25K to open a direct Rydex account. Might be worth a look.

Regards,
Bill Szaroletta

if you want to get the emini futures on quote.com, you have to tell neuroshell about the symbols, because they arent there now. make a text file called "emini futures.lst" and save it into the servers folder of neuroshell. here is what i have in my file:
ESH1, March 2001
ESM1, June 2001
ESU1, Sept 2001
ESZ1, Dec 2001
ESH2, March 2002
ESM2, June 2002
ESU2, Sept 2002
ESZ2, Dec 2002
right now i think only the march 2001 contract is active. i got those symbols off of cme.com

E-Mini generally refers to the EMini S&P and E Mini Nasdaq Futures. They are smaller contracts and are traded only electronically.

On Quote.com the current contract symbols are ES01H (e mini s&p march) and NQ01H(emini Nasdaq march)

http://www.cme.com (Chicago Mercantile Exchange) has complete info.

Cluster add-on?

Date :1/4/2001 7:07:45 PM Poster : Michael Stigall

Has anyone else tried out the new Cluster indicators? I didn't have much result with using them as NN input, but received excellent improvement by using them as entry/exit points in a trading strategy.

I'd be interested in hearing about other folk's experiences with the new tool.

Thanks.

Omega Tradestation Pro

Date :1/12/2001 4:57:36 AM Poster : John Hegarty

Has anyone used Omega's new monthly subscription Tradestation Pro service, which includes both historic and real time data, in conjunction with NST. I'm interested from a perspective of becoming a subscriber and of using the service as my sole data source for NST models, but not for day trading at this stage (learning to walk is challenging enough!).

NB: The details on their web site mention that this does not use Omega's Global Server and I noted from the last news letter that use of Global Server would be incorporated into the next release of NST. Here I'd be interested in feedback on compatibility with the forthcoming release.

Regards

John

We are probably disappointed more than anyone, given the thousands of dollars we have spent trying to get the GS to work flawlessly for us. Actually, we never did provide a supported version for GS INTRADAY. We will continue to support the end of day interface. We tested intraday in beta, but never were able to get it working 100%. Omega did not assist us, even though we feel the problems are in the GS. The capability will be there for anyone who wants to use it. If you are a beta tester already, and you don't have any problems with the interface, you will probably continue to have none. A few beta testers experienced infrequent crashes, but many had no problems at all.

JM,
I fully support your comments, and I upgraded to the DayTrader for the same reasons. I believe the new TS Pro is quite expensive, and the special upgrader discount is modest consolation in relation to the cost of TS2000i.
The current Quote/QCharts feed can only be an interim solution, and I would also like to get more clarity about future intraday feed support. Are there for WSG, other possibilities worth considering, like eSignal from DBC?

regards

Re: Omega Tradestation Pro

Date :1/18/2001 10:43:04 AM Poster : Michael Stigall

A few observations on the new Tradestation Pro tool. I'll try to be balanced on the pro/con angles....

1) TS Pro is hosted on NT servers over a web interface. The data and application run mostly on the Omega server computers. This is the development environment that I work with every day. I expect some major "scaling" problems for the Omega staff, since they're moving from single-PC client applications to web-based client-server development.
2) Omega will store the historical data and will be responsible for the cleaning, update, etc. I'm certain the web site will contain the standard disclaimers for missing or bad data.
3) The nice part will be the centralization of data, program updates, etc. Update the central server and all of the attached clients will be upgraded during their next session.
4) I like the web-based subscription service, with thin clients. Keeping 10 years of data on stocks and the necessary info for their stock options consumes quite a bit of disk space. And their current model gives me headaches trying to add new symbols, keep the stock option tables up to date, etc.

Some things I don't like:
5) 3rd party tools are out of luck (such as NS Trader). You'd have to fit within Omega's web-based delivery model (Java applets?) or be willing to run some background batch tool to provide data based on user queries.
6) Since the data resides on Omega's databases, 3rd party tools will either need to be run at the Omega server side (ready access to data) or will end up sending big web-based data requests over the wire.
7) I would guess that customized/optimized systems will suffer most. If I fine-tune a trading system with optimized indicators and perhaps optimized entry/exit points, then where does this code reside? My computer (no data) or theirs (shared libraries)?
8) The system bundles up trading with a brokerage which Omega purchased - Online Trading. I've used ETrade for years, and I recently opened another account at CyberCorp. I don't know anything about Online Trading, and I don't particularly care for having my selection of a brokerage tied to their product (at least for the automated entry/exit signals).

Does this stir up the conversation any? <grin>

Hi,

I believe all systems and analysis templates are stored on the local machine and not on Omega's server.

As for me, no way am I going to upgrade to TS Pro. Currently, TS2000i with SP5 is serving me well. I don't expect SP 6 will be released at all, neither do I believe that Omega will spend anymore development time on TS2000i. So, I will just use TS2000i for as long as long as I can, squeezing every last ounce of juice from the dame, and then ditch her when something better comes along. Anyone got any recommendations?

JM

Hi Bruno,

Yes, yes, yes, yes!!!! I am on eSignal too!! Can Ward consider eSignal, so I don't need to interface with Global Server?
I thought I am the only one using eSignal while everyone else is using Quote.com.

As for the current interface to GS, I am one of those that get the occassional crashes in DayTrader due to the GS interface.
It is pretty scary to crash in the middle of a trade. So if possible, I would love to bypass GS entirely.

JM,

Thanks for the advice on pricing. I'm not a TS2000i user but have been able to get their special offer on the basis of having an old copy of Wall Street Analyst. I suspect that the offer might be open to many.

At $99 a month TS Pro looked like being worth a try since I can allways cancel. Rightly or wrongly (or is it naively) I had gained the perception that Omega were the market leader.

My first reservation, being UK based, is that data is restricted to the US. For UK blue chips ADR's are not a problem (and given lower trading costs and no UK Gov' Stamp Duty have significant advantages).

Secondly it does not give the capability to import data so bringing data from another market is not now possible.

Regards

John

Re: Omega Tradestation Pro

Date :1/19/2001 10:54:16 AM Poster : Eric L. Hoyle

I don't want to turn this into a Omega bashing forum, but I bought Prosuite 2000i because I viewed it as a market leader as well and have been very disappointed. From a technical side, I have found that my files often become "corrupted". When that happens, I have to completely recreate my desktop, not something you want to do in the middle of the trading day. This seems to happens most often at the open, when I have large amounts on data streaming in. Despite upgrading to a high speed serial port (I use a DTN satellite system for data) it appears that it is not fast enough to keep up. DTN says the problem would be solved if Omega would use the Ethernet connection they offer, but Omega has declined. They told me the program was "complete" and they are not going to make any other changes. Personally, I've lost all my saved files too many times for me to consider it "complete" or even stable. I've spent too much time on hold (on my dime) with their technical help people, who's only answer seems to be: delete your current files, wait 4 fours for new codes to be sent and recreate your work. "I'm sorry sir, it appears your files have become corrupted." Thanks....

When I purchased the program, the salesman assured me it could handle as many securities as I wanted it to. However, I've found that asking it to store US Stocks and their Option Chains is far too much data. I understand that is a huge amount of data, but it would have been nice to know that before I bought it. If it's not suited for institutional type uses, don't pretend it is. (FYI I'm running it on a Dell Workstation with dual PIII Xeon processors and 512 memory) Which brings me to my second concern. I don't trust the company. At this point, I don't believe anything they tell me.

Omega stopped selling the program 1 month after I bought it. Ok, so that's my bad luck. And while at first, the $99 a month offer for the internet version of Tradestation sounded nice, let's think about it. Notice that Option Station and Radar Station are not yet available on the web. Will they cost more??? At $99 a piece a month (and I have no idea if that's what they will charge) I'm back to almost the $300 a month, which is what I'm paying for Prosuite. And that assumes that they don't come out with an "upgrade" to their Tradestation.com site that you will need to pay extra for. I certainly didn't think 2000i would be "upgraded" (ie phased out) before the year 2000 was over! PLUS, I have to continue to pay for Prosuite 2000i, while paying $99 a month for the same software on the internet. And while I can't say I won't try the internet site, having Omega store and supply the data is a benefit, I'm starting to feel like I should cut my losses and run. The Universal Server option on NeuroShell Trader is sounding better and better.

Sorry for my rant. Good luck.

Sincerely,

Eric

Re: Omega Tradestation Pro

Date :1/22/2001 5:05:15 PM Poster : Steve Ward

I'd like to comment on some things in this thread in no particular order. As a disclaimer, neither Ward Systems nor any of its employees are really TradeStation users. We use it enough to interface, but we use NeuroShell for trading as you'd expect. So we aren't qualified to comment on how good it is, or Omega's tech support, or costs, etc. We have always liked the company's managers personally as we dealt with them, and we have liked TradeStation's widespread use, which is why we are a "provider" and we to try to interface with it, not always with success. Now for the comments:

1. Non-support of the Global Server interface doesn't mean we intend to abandon it, and doesn't mean we won't tell you how to turn it on. It means that if anything bad happens, we probably can't fix it. We already know some bad crashes occur ("general protection faults" and "automation errors") that we can't fix (we think they are Omega problems that we have no control over. We are in the same boat you are in with respect to the Global Server). As usual, you and Omega are responsible for making the Global Server work. We will post info on this web site on how to activate it, but we won't send out NeuroShell Traders with the feature already activated. We don't like to sell software that doesn't work reliably and that we have no way of fixing.

2. We thought TradeStation Pro was a "web based" program too, until we looked at it (we don't have any more access to company info than you do!). Now it appears to us to be executing on the computer and only getting data from the web. (It obviously places orders on the web too.) Although it does not appear to have as much historical data as Quote.com, it appears to download it faster. Of course, the speed could decrease when TradeStation has as many customers as Quote.com has, who knows.

3. We already know our import/export of daily data streams still works with the Pro, and we hope we can read the downloaded data. We are waiting for TradeStation Group, Inc. to provide the instructions we need to access their data in the Pro.

4. True that both NeuroShell and TradeStation eat up a lot of machine cycles, but if you limit the amount of bars NeuroShell displays (not loads) on the chart, it will react a lot faster. Neural nets take quite a bit of machine, so limiting them, including the number of walkforwards, will help a lot.

5. If you think about building neural models, or backtesting traditional models, you realize you have to have lots of historical data. There are very few companies which provide historical intraday data, at least more than a few days back. We started with Quote.com because they had the most. Global Server with History Bank was the second best choice, we thought, and TS Pro may be the third, because again they have lots of data. Of course, we aren't sure if we will run into the same kinds of problems with the Pro that we had with the Global Server!

6. The Universal Market Data Server (uniserv.com) is surely tied for third, and we are working hard to support it, because we know we need more feeds. It will save data for you as you leave on your connection so that you can have a reasonable amount of intraday historical data. That's not quite as good as being able to request back data, like with TS and Quote.com, but it will provide a good alternative to those others.

7. Beyond getting release 3.2 out, getting more data feeds is our highest priority, because we feel that Quote.com has periods of unreliability, and so does the Global Server. If anyone knows of another data service that they are SURE provides historical intraday data more than just a few days back, we'd like to know about it.

Re: Omega Tradestation Pro

Date :1/22/2001 6:59:47 PM Poster : Dave Johnson

Steve, Nextrend in Dallas at one time was planning to store at least one year of historical intraday data. In fact, their web site claims intraday trade history since January 1998

I am not a user, but I saw their server banks last year during a visit.

I tried the service for a brief time, but greatly preferred qcharts for chart/indicator quality, features, and sophistication. But, despite the elegant design of qcharts and qfeed, the reliability is dropping fast. Maybe Nextrend is worth another look.

We will post info on this web site on how to activate it, but we won't send out NeuroShell Traders with the feature already activated. We don't like to sell software that doesn't work reliably and that we have no way of fixing.

2. We thought TradeStation Pro was a "web based" program too, until we looked at it (we don't have any more access to company info than you do!). Now it appears to us to be executing on the computer and only getting data from the web. (It obviously places orders on the web too.) Although it does not appear to have as much historical data as Quote.com, it appears to download it faster. Of course, the speed could decrease when TradeStation has as many customers as Quote.com has, who knows.

3. We already know our import/export of daily data streams still works with the Pro, and we hope we can read the downloaded data. We are waiting for TradeStation Group, Inc. to provide the instructions we need to access their data in the Pro.

4. True that both NeuroShell and TradeStation eat up a lot of machine cycles, but if you limit the amount of bars NeuroShell displays (not loads) on the chart, it will react a lot faster. Neural nets take quite a bit of machine, so limiting them, including the number of walkforwards, will help a lot.

5. If you think about building neural models, or backtesting traditional models, you realize you have to have lots of historical data. There are very few companies which provide historical intraday data, at least more than a few days back. We started with Quote.com because they had the most. Global Server with History Bank was the second best choice, we thought, and TS Pro may be the third, because again they have lots of data. Of course, we aren't sure if we will run into the same kinds of problems with the Pro that we had with the Global Server!

6. The Universal Market Data Server (uniserv.com) is surely tied for third, and we are working hard to support it, because we know we need more feeds. It will save data for you as you leave on your connection so that you can have a reasonable amount of intraday historical data. That's not quite as good as being able to request back data, like with TS and Quote.com, but it will provide a good alternative to those others.

7. Beyond getting release 3.2 out, getting more data feeds is our highest priority, because we feel that Quote.com has periods of unreliability, and so does the Global Server. If anyone knows of another data service that they are SURE provides historical intraday data more than just a few days back, we'd like to know about it.

Hi,

This is in response to Steve Ward's request in comment #7 where he said, "If anyone knows of another data service that they are SURE provides historical intraday data more than just a few days back, we'd like to know about it."

I just received the following notice from TC2000 by Worden Brothers indicating that they are adding real time capability to their excellent end of day data. Perhaps the programming wizards at Ward Systems can find a way to capitalize....

Randy Brown

Here's the announcement:

TC2000 Real-Time:

... now streaming ...

We are excited to announce that TC2000 version 4.5 (enabled for Real-Time) is now available. Activate Real-Time Service today, and we'll rush you the brand new Version 4.5 CD-ROM and Real-Time Quick Reference.

The look and feel of TC2000 remains intact, however, you'll never again press the update button because all your data is always current. Plus, you'll now have access to streaming tick charts, minute charts... even 5,10,15,30 and 60 minute charts... that update dynamically during market hours.

And yes, all the indicators, including MoneyStream, Balance of Power and Time Segmented Volume unfold live on the real-time intraday charts. Currently, the intraday charts display up to 10 market days of detailed history. In the near future, we plan to greatly expand this.

Traditional bid, ask, bid/ask volumes, last, % change and the NASDAQ bid-tick indicator all update dynamically in your WatchList tabs. No more popping over to your broker's web site for a detailed real-time quote.

Access to the Real-Time Stream requires an active Internet connection and costs an additional $49.75 per month (includes all non-professional exchange fees.) A standard 28.8k modem (or faster) works very well.

On 1/22/01 5:05:15 PM Steve Ward wrote:
I'd like to comment on some things in this thread in no particular order. As a disclaimer, neither Ward Systems nor any of its employees are really TradeStation users. We use it enough to interface, but we use NeuroShell for trading as you'd expect. So we aren't qualified to comment on how good it is, or Omega's tech support, or costs, etc. We have always liked the company's managers personally as we dealt with them, and we have liked TradeStation's widespread use, which is why we are a "provider" and we to try to interface with it, not always with success. Now for the comments:

1. Non-support of the Global Server interface doesn't mean we intend to abandon it, and doesn't mean we won't tell you how to turn it on. It means that if anything bad happens, we probably can't fix it. We already know some bad crashes occur ("general protection faults" and "automation errors") that we can't fix (we think they are Omega problems that we have no control over. We are in the same boat you are in with respect to the Global Server). As usual, you and Omega are responsible for making the Global Server work. We will post info on this web site on how to activate it, but we won't send out NeuroShell Traders with the feature already activated. We don't like to sell software that doesn't work reliably and that we have no way of fixing.

While I think that Steve was looking for real time data feeds with online historical data, this could be a source of historical tick data for backtesting.

Best regards,

Dick Park

daytrader pro questions
Date :1/18/2001 1:39:20 PM Poster : Jimmy Raineri

1. If/when you are disconnected from the quote.com feed, you are presented with a message box asking if you want to reconnect or not. Is there any way to have it attempt to reconnect immediately, and then every xx seconds thereafter until told otherwise? The fact that it won't automatically reconnect pretty much negates any benefit of setting alerts - I'm listening for an alert from across the room or in another room and I have no idea that it isn't even connected. It also makes unattended operation impossible.

2. In the trading strategy parameters, there is the option to "buy as many shares as possible with current account balance". I don't think this is working properly - it uses the profit from a current day trade to make the next trade - that money is not in your account at that time and would result in a regT call. Is there any way to make it properly calculate the real "buying power" in an account at the start of day and trade for that day based on that only?

Thanks for any assistance.

Re: daytrader pro questions
Date :1/18/2001 2:17:31 PM Poster : Ward.net Webmaster

Release 3.2 already has the feature you are requesting in #1. With regard to #2, this may depend on your broker. The daytraders here at Ward Systems use Datek, and they seem to make the credit available after every trade. The others here tend to use Ameritrade, which we think does not seem to make the money instantly available. We suspect that firms which cater more to daytraders are more like Datek than Ameritrade. Maybe we can hear from other users with other brokers on this issue?

2. In the trading strategy parameters, there is the option to "buy as many shares as possible with current account balance". I don't think this is working properly - it uses the profit from a current day trade to make the next trade - that money is not in your account at that time and would result in a regT call. Is there any way to make it properly calculate the real "buying power" in an account at the start of day and trade for that day based on that only?

Thanks for any assistance.

Re: daytrader pro questions
Date :1/18/2001 6:51:47 PM Poster : Jimmy Raineri

That's pretty unusual to make a current day profit available for trading - but then again wasn't Datek the one who would let you short a stock no matter if it had the stock or not?....

Either way, since it is not the norm to make those funds available current day, is there a way, or could a change be made to make trades based only on the amount of money in the account at the start of the day? It is pretty hard to come up with an accurate training when the system trades with money it doesn't really have.

When will release 3.2 be available?

Thanks.

On 1/18/01 2:17:31 PM Ward.net Webmaster wrote:
Release 3.2 already has the feature you are requesting in #1. With regard to #2, this may depend on your broker. The daytraders here at Ward Systems use Datek, and they seem to make the credit available after every trade. The others here tend to use Ameritrade, which we think does not seem to make the money instantly available. We suspect that firms which cater more to daytraders are more like Datek than Ameritrade. Maybe we can hear from other users with other brokers on this issue?

i just received a brochure in the mail from ameritrade saying they now have real time account updates. account balances are now updated "immediately after your transactions occur". brochure says it makes it easier to place multiple trades during the same trading day.

What issue to pick - a useful procedure???
Date :1/23/2001 8:11:54 PM Poster : Jacobs

First I will thank you all for your interesting postings and WSG that have started this forum.
Special thanks to those who submitted code,dll´s ,templates and book recomendations!

I have found it rather difficult to build a useful neural net model for a particular issue.
Besides, Steve Ward has a couple of times written that we should select an issue that is easy to predict and if an issue is predictable many models(variables) will predict it.

These last days I have tryied another version – I´ve started with a model searching for an issue.
This search is done in different steps.
Model: 5 inputs, 40 hidden nodes in training mode and default (10?) in genetic mode.
Optimize on training set.
Training time 3-5 years + 1 walkforward of 1 year
1.) Run the model for as many issues you can - in optimizing mode(parameter search)
2.) Throw away those issues that are nonprofitable (negativ return).
3.) Of the remaining issues throw away those that have a return that is less than buy&hold

Now you have issues that are profitable and the model is better than buy&hold.

Now change the evaluation period - use two walkforwards of 6 months, still using the same dates as before.

4.) Run/optimize the model again for the found issues.
5.) Throw away those that are nonprofitable
6.) Keep only those that are better than buy&hold
7.) Of the remaining issues keep those that show a profit and
have a return that is better than buy&hold on BOTH walkforwards.
(both walkforwards should now show a profit and the return
is better than buy&hold)

I end up with profitable issues that show some degree of consistency,
both walkforwards show a profit and the profit is better than buy&hold.
Optimization is meant as a filter. If it can find parameters
that show a profit in the past and the future(out-of-sample) it´s a sign of
repeating movements in those issues.

To refer to the beginning – repeat the procedure with a (quite) different model.
See if some issues turn up again – in the end of the process or near the end...
(I have only done this with one model)

Well, this procedure seems rather mechanical.
Are there any hidden problems that I have overlooked?
How dangerous is the procedure – like using the result on the out-of-sample
to correct/adapt your model?
Where are the critical parts and how can I reduce them?
Is this a way worth trying?

Any comments are appreciated.

I have to apologize to everyone for lurking here so long without contributing but I am not a professional trader like you and the others. I only just started trading when I got Neuralshell a while back. I was amazed that your systems is so much like mine, except that I dont evaluate two different ways, but now I'm going to try it out your way. Ive been reading all the things Ward has put out and I can't see where we have anything wrong here and it has seemed to work good enough for this country lad to use. I have to warn you though that I'm only into stocks at this time but I got hooked enough to know that I want to expand out later.

Jacobs:

I too like your method. You keep the number of inputs and hiddens small. You seem to avoid the problem of fitting the evaluation set by running a model only once. The fact that you use many issues in that one run means you can find predictable ones without the evaluation fitting. You help assure that the predictability was no accident by running with a different evaluation set. You don't train too far back and you don't insist on a long evaluation set, which I like. To all of this I would suggest diversification in all of the models that result. Thanks for sharing this with us.

End of Day Data Sources besides HistoryBank
Date :1/26/2001 2:23:30 PM Poster : snd
Does anyone have End of Day Data source they would recommend with Neuroshell Trader?

Re: End of Day Data Sources besides HistoryBank
Date :1/27/2001 10:39:49 AM Poster : JM
Hi,

I use Pinnacle Data for futures end-of-day data. Pinnacle's data seems clean and their data-maker software offer unadjusted, forward-adjusted, backward-adjusted and ratio-adjusted continuous futures price data, which is suitable for neural networks. Service is good and price is cheap. Daily update of database is done over the Internet using their downloader program. I strongly recommend this data provider. Their URL is www.pinnacledata.com.

I am not in any way connected to Pinnacle, but just a very satisfied customer, and just feel like sharing this info with everyone here.

If you are modeling stocks, you might want to try Yahoo Finance - Historical Data , it is downloadable into csv format. The data is available for free and as much as thirty years is available for most stocks. I believe it is provided by CSI for Yahoo. However you must re-sort the data from earliest to latest to make it work with NS Trader, this can easily be done with Excel or similar.

Best regards

There is a free piece of software called QuoteMonster available at www.xmlworks.com . It is really a set of perl scripts, but it will do the trick.

I used it before I signed up for CSI to test my simple ideas - I would not dare to use any free data floating around for my trading or system creation. The risk is simply too big in futures trading.

Results of Search: End of Day Data Sources besides HistoryBank
Date :5/6/2001 5:44:22 PM Poster : Stephen
All,
After using or reviewing Dial Data, HistoryBank, Telescan, Prophetlink and CSI the winner by far was CSI. My observations matched the conclusions of an article in Future's Magazine on End of Day Data sources. My personal experience with Dial Data and then later HistoryBank was a constant battle with bad data. Trading systems would look great until I looked back through the results and found the 500% winner made the system. Zero's would cause Tradestation to blow up while scaning charts. Prophetlink look good so I signed up for the trial and downloaded some select stocks. The 30 day trial only lasted a day, I found a zero in the volume data of SSTI. Yahoo uses CSI data and provides it for free, so I had thought of crafting my own downloader, but decided it wasn't worth the time. It has been I while since I used Telescan, but I don't remember being impressed. Thanks for your help. Hope this is of use. - Stephen

maybe my excel is set up different, but i downloaded from yahoo and didn't have to change the date format. in fact when i select download spreadsheet it loads excel right into my browser if i select the open option in the browser instead of the save option. i then just selected the columns and used the sort command to reorder the rows. very easy since i didn't even have to load up excel. then i just saved in the csv format into the folder that i use with neuroshell.

Prophet Finance has good and inexpensive data that can be downloaded using the Dial Data downloader that is already part of Neuroshell. You just change the internet web site it goes to, and their server mimics the Dial Data one.They can also deliver in Metastock format, which seems to work fine in Neuroshell. See www.prophetfinance.com/marketdata/

Hello,
I am trying out Prophet at present and would like to give the Neuroshell inbuilt downloader a go at miimiking dial data, as you mentioned, can you may be help with the Prophet download server address?
Also Prophet says they have cash contracts, but I do not get data for EC1599, JY1599 etc.
Indices tickers seem not to be as numerous as with Quote.com ,
some strange values like negative (!) or zero quotes have appeared exceptionally at least with continuous contracts at my side
Thanks
albertl

Hi Albert - I use Quote.com now, but I remember that Prophet provided an alternate URL to go into the Dial Data downloader. You have to tell them that you are using NeuroShell Trader, and that you want their product that uses the Dial Data Downloader. They give you URL that replaces Dial Data's URL. You go into the data sources menu and into the end of day download part. Then in Dial Data download setup, theres an internet setup button that has dial.tdc.com and dial2.tdc.com in it. I just replaced those with what Prophet gave me. I suggest that you email Prophet tech support with the other questions, because I don't remember much about their ticker symbols. If they don't help you, I guess you can try Dial data - I recall they weren't that much higher; maybe their symbols are more like quote.com. I think you're supposed to tell them that you are using NeuroShell also.

Thanks Maxwell,
I thought by now I would have got an answer from prophet, so I could pass on the URL. I am slightly put off now, as they just are increasing their prices. I believe also I would have to subscribe to the futures data in order to get currency data, this would be an overkill .Their index data seem not to include currency indices and I do not need futures for the moment.

So I am turning now to track data or may be to AIQ. I wonder if anybody is using AIQ (the program and the data) and profiting the data for the NS Trader?

Today I am emailing the CEO of Prophet Finance and asking that they find out what happened with your answer. Let me know if they still don't answer. I have always thought they were more responsive than most data feed vendors. I am hoping your request just got lost somewhere.

Here already the answer from AIQ (it took 2 emails from me before they reacted)
" Dear Albert, Yes, you can download the historical data to Excel, DIF, PRN, and ASCII files. These are normal files, tab or comma delimited. Whether or not you can use the data in the Neuralshell program is something you'll need to take up with them. I hope this answers your question. ... Regards,.Sandy..."
At 59$ (basic-with unlimited historical and delayed data). Seems worth trying out, hope the exact fields / format will not give trouble in the end and that the indices and currencies will be there.

The .PRN files should load as long as there are descriptive text labels on the first row. Ask them to email you one file so you can try it out. Also, NeuroShell will read AIQ files in AIQ format. If the ticker symbols are the same as the ones on our historical CD, you should not have to download anything older than the last date on the CD files, because NeuroShell "glues" files together with the same ticker symbol.

If the ticker symbols are different (say on continuous contracts or indexes), that could be one reason to use Dial Data because our historical CD is provided by Dial Data. You can get the Dial Data account which only goes back to when your historical CD ended, which could be cheaper than the unlimited one.

Thanks,
1)Yesterday Prophet sent the URL of their download server:
"The URL for the service you mention is
data.prophetfinance.com, the IP address is 207.33.55.106"
Unfortunately I get the error messages
," cannot connect to data.prophetfinance.com"
and "could not resolve host gluttony.prophetfinance.com##:11001"

2) regarding downloading with prophetfinance`s own downloader I must say,
they were quite helpful , if only I could find the currency indices , I would stay with them

3)downloading end of day data by means of a normal end of day downloader program seems now a luxury to me , in comparison with the real time quote.com service which I was using to pull the end of day data I say this to the intention of the friend in this discussion group who enquired about the different services quote.com is providing, I never found out if quote.com is providing an end of day downloading service and a corresponding downloader , or not. I suspect they dont .
Does anybody have more info?

Sorry, Albert, I don't know if quote.com has any download package that has end of day only. Their web site is so hard to navigate! I do both intraday and daily bars, but I get the data mostly at night. Regarding Prophet, if they are now helpful after Steve's email, why don't you just email them about the indices? Please post here what they say. BTW, prophet has not only a package that delivers to the Dial data downloader in NST, but they have another as I recall that delivers metastock format which NST reads. I also used Dial Data themselves, and had no problem with them either. Dial data must have currencies because some currencies come with NST.

At 59$ (basic-with unlimited historical and delayed data). Seems worth trying out, hope the exact fields / format will not give trouble in the end and that the indices and currencies will be there.

Re: End of Day Data Sources besides HistoryBank

Date :8/29/2001 3:37:09 PM Poster : albert stoffel

Hello Maxwell,
Sorry for the delay
1)regarding Prophet Data
they gave only this answer to my request for including currency indices in their stocks&indices package:
"Albert,
You're correct, these are not among the indices that we provide.
I have submitted a request to add this to our database and also spoke with our data manager."

2)Regarding DOWNLOADING HISTORICAL DATA from QUOTE.COM :
I have found this , but not tried out yet, under their QFEED service description:

"UTILITIES
QcomBarData by Dan Dill
A useful utility for downloading data from QFeed™ on a scheduled basis, regularly and automatically downloads daily or intra-day data from the QFeed™ data service into ASCII files for use in Dynamic Trader software (or any other software that can use ASCII-formatted text file data).
SpreadMsg Lite by Compuquest, Inc.
Monitor stocks, mutual funds, futures, currencies, & receive alert messages via E-Mail, Pager, Cell phone, etc. Your custom rules determine content and time of message delivery.
Several more are in development - stay tuned... "

I was using QCHARTS BASIC previously, consider now going back on qcharts if this download utility can be used also with subscription to qcharts.

By the way ,quote.com is proud that we have to download each time we log back on " we do not have to keep the info on our computer" and this way " we do not loose any tick"

3) regarding CURRENCIES and FUTURES under qcharts basic

I still do not know if there is a way of getting these data are real time qcharts basic, I managed to see them only delayed, even though in livecharts they are real time to my knowledge, Does one need qcharts intermediate or may be qfeed

can anybody help?

albertl

On 8/17/2001 9:33:39 AM Maxwell Craven wrote:
Sorry, Albert, I don't know if quote.com has any download package that has end of day only. Their web site is so hard to navigate! I do both intraday and daily bars, but I get the data mostly at night. Regarding Prophet, if they are now helpful after Steve's email, why don't you just email them about the indices? Please post here what they say. BTW, prophet has not only a package that delivers to the Dial data downloader in NST, but they have another as I recall that delivers metastock format which NST reads. I also used Dial Data themselves, and had no problem with them either. Dial data must have currencies because some currencies come with NST.

On 8/16/2001 4:33:34 PM albertl wrote:
Thanks,
1)Yesterday Prophet sent the URL of their download server:
"The URL for the service you mention is
data.prophetfinance.com, the IP address is 207.33.55.106"
Unfortunately I get the error messages
: "cannot connect to data.prophetfinance.com"
and "could not resolve host gluttony.prophetfinance.com##:11001"

2) regarding downloading with prophetfinance´s own downloader I must say,
they were quite helpful , if only I could find the currency indices , I would stay with them

3)downloading end of day data by means of a normal end of day downloader program seems now a luxury to me , in comparison with the real time quote.com service which I was using to pull the end of day data I say this to the intention of the friend in this discussion group who enquired about the different services quote.com is providing, I never found out if quote.com is providing an end of day downloading service and a corresponding downloader , or not. I suspect they dont .
Does anybody have more info?

Re: End of Day Data Sources besides HistoryBank

Date :9/4/2001 8:35:42 AM Poster : Steve Ward

We've actually talked to the Hyperfeed people before. Unless something has changed, they are sort of a wholesale data distributor. If we purchased their data, we could resell it to you as you connected to a server we'd set up. At least at that time, they didn't sell direct to the individual trader. So we would have to get into the data feed business, like TradeStation Pro. It is always an option, but it would represent a big diversification for us.

a reliable internet broker for FUTURES(NOT STOCKS)

Date :1/29/2001 7:33:02 PM Poster : David

As I live in Brazil(south america) it's quite difficult to choose a reliable internet broker in the states for FUTURES trading (not STOCK trading).
Could some of you give recomendations?
Thank you.

Re: a reliable internet broker for FUTURES(NOT STOCKS)

Date :1/30/2001 9:43:55 AM Poster : Sam

David,
I use XPRESSTRADE in Chicago (not daytrading). I also trade futures, not stocks and have tried many other Internet brokers but prefer and use Xpresstrade.
It is an Internet based. Check it out. www.xpresstrade.com
Good luck

Emergency Alert to Quote.com Users

Date :1/30/2001 2:58:49 PM Poster : Ward.net Webmaster

Emergency Alert to Quote.com Users

Since the NYSE changed to decimals on Monday January 29, 2001, some of our Quote.com users have noticed bad stock prices from NYSE. The problem is that Quote.com updated their interface last year, but you may have an older copy that was installed with NeuroShell. You will need to put a new copy (dated at least 10/09/00) of the quote.com module (ContinuumClient.dll) into your windows/system directory (winnt/system32 for Windows NT and 2000 users).

You can search your computer to see if there is a newer one, perhaps in a Qcharts directory, or go to the "Known Major bugs, fixes, and warnings" section of this site to download one. Once you've downloaded this file, execute it and the ContinuumClient.dll will automatically be installed into the correct directory.

In addition to storing the new dll into your computer, you will have to erase any data files with bad data that the Trader has already placed into your computer. Go to the NeuroShell Trader folder and open the Server folder, and the Data folder within that. Erase any NYSE files with dates January 29th or later.

We apologize for not realizing sooner that this would happen.

Correlation

Date :2/4/2001 1:29:22 PM Poster : scantley

So here's a wierd idea...

We have this GA hiding in our application here, and I wonder if there's any way to use it for other purposes.

For example, can anyone think of a way to take two or three indicators, and cause the GA to find parameters with the lowest correlations? Nothing straightforward comes to mind, but is there a subtle approach that someone can think of?

If not, then the folks at Ward might drop something like this into idea jar for version 4 or 5 or so. Trader is already configured to use the GA to minimize and maximize functions for predictions and trading strategies. It isn't that big a stretch to want to find a way to use it to outside of these two environments.

Anyone?

Best,
Steve

Re: Correlation

Date :2/6/2001 1:47:14 PM Poster : chris wong

i can do it by hand at least. i used the linear xy regression: coefficient of correlation indicator. i fed two indicators into it. then i changed parameters by hand until i saw correlation getting lower.

What you want to do is fairly easy with our GeneHunter product (maybe a little bit harder with three indicators instead of two). Yes it is embedded in the Trader Pro, and yes we might be able to figure out how to expose it to Trader Pro users in some future version, but in the mean time we have many users who supplement the Trader's capabilities with GeneHunter. They also use GeneHunter to optimize portfolios, build stock picking rules, and other types of indicator optimization that might not be possible in the Trader Pro. The downside: you have to be fairly proficient with Excel, because everything is not turnkey like it is in the Trader Pro. So if any readers of this forum want a copy now and not wait for some future version, I'll see if I can pull some strings and get you get a 20% discount off the $395 price from now till March if you call or email me before then.

I was wondering why you want to do this. All I can think of is that uncorrelated indicators might make better inputs to neural nets. However, the NSTP optimizer already crafts the indicators to make the nets work best, which might involve more than just being uncorrelated. Is there something I'm missing?

Need for additional add-in program

Date :2/4/2001 4:59:14 PM Poster : AlMart

Gentleman, I thank you for the product. It has tremendous potential. My biggest problem in making use of that potential is the fact that much of what I study calls for additional programming. While, I can do some of the programming myself, it is a long and arduous process because I am not good at it. My reasoning regarding trading tells me that I am interested in high probability patterns. I am not concerned with low probability or ambiguous events. If that means that I should only trade once every four days in a market that's perfectly fine with me. Therefore, I am looking for an interface that will allow me to use the trader and manually identify the patterns that are of interest to me. A few simple mouse clicks would provide me with the ability to focus your product on very specific patterns. Such a simple add-in feature would provide tremendous utility and avoid hours of programming. Proponents of Elliot wave would have the opportunity to capture regular or irregular wave counts with simplicity. Those traders who use price patterns along with volume or some other indicator would be equally happy. Exactly, this kind of approach using neural nets was raised in a Technical Analysis of Stocks and Commodity article by Jeffrey Katz,PhD (I believe). If this an upcoming product please let me know. I am submitting this suggestion because I am certain that their are many others who are looking for this type of a user friendly interface.

The ideal way would be for Trader to interface with a low cost but high quality charting and T/A program, say, Metastock.
Any Chance?

I really like the pattern recognition tip that Neuralshell put into the december issue of Stocks and Commodities. I think it was also in a Neuralshell newsletter too if I'm not mistaken. It uses lines to form patterns.

Yesterday we announced the new Fuzzy Pattern Recognizer Add-on in our monthly newsletter. It looks like it fits your need and then some in terms of being able to specify a pattern and then find it in a time series. How's that for fast response to customer requests? Athough you can't actually draw the pattern on the screen, it is very easy to describe a pattern in fuzzy rules. The fuzziness also means that you get a probability that your pattern exists, not just a binary yes or no. That means it will even tell you that it found a pattern "somewhat" like your pattern. In addition, you can let the optimizer find new patterns you didn't think of yet.

We are taking backorders right now. The Fuzzy Pattern Recognizer is done and ready now, but it is based on the soon to be released NeuroShell Trader release 3.2 platform. Notice we also have fuzzy release dates like "soon". If we didn't, we'd be under pressure to release on a certain date even if all the bugs aren't out, and we'd rather kill the bugs than meet an arbitrary deadline.

Fuzzy addin

Date :2/27/2001 5:05:46 PM Poster : Xprogrammer

Steve,

Will the fuzzy plugin that I purchased actually be shipped when the new release is out, or if not how long after that? I am very anxious to use it, because I have been looking for something like this. Any new fuzzy descriptions of the release date available yet? Are you up to "real soon" yet?

Re: Fuzzy addin and new release

Date :3/2/2001 1:50:53 PM Poster : Ward.net Webmaster

We are definitely in the "real soon" phase now, because the release is ready and we are cranking up production and trying to get our free web download set up. Start watching for it in the "Release news ..." section of this website. Once the CDs are made, the shipments of the Fuzzy Pattern Recognizer add-on will be sent first in order the purchases were made. Free release 3.2 CDs will be sent with the Fuzzy addon. Other users can download for free or we'll send new CDs for $30 plus shipping.

fast fourier

Date :2/13/2001 8:58:26 AM Poster : chris wong

i have adaptive turboprop 2 addon that i purchased several months ago but just started using. it has an pretty good example that seems to do well with the fft fast fourier indicators. previously i didn't get much from fft but with at2 it works well even when no hiddens are put in the at2 nets. at2 help file says no hiddens is linear regression meaning it hasnt even gotten to the point of building a net and already good results. has anyone else had any experiences with fft outside of at2?

Re: fast fourier

Date :2/13/2001 9:28:22 AM Poster : Xprogrammer

I just purchased AT2 also but I have been concentrating so far on some of the other aspects. Not being an engineer, I don't know much about FFT. I have been interested in verifying the capabilities that the Neuroshell web site touts, like being able to optimize the output, number of hiddens, training set size, how often to retrain, and how far ahead to predict. Being an old (literally!) Neuroshell2 user, I understand the old neural nets pretty well, and I had even thought myself that NST should have had that flexibility before. I even considered programming backprop in a DLL, but my programming experience dates to the COBOL days. Have you done any optimizing of outputs yet? Any suggestions on what outputs to use that would benefit from optimization?

We frequently hear from people who say: "I am an old COBOL programmer, but I can't write DLLs." or "I have written Easy Language but I'm not a programmer."

Well, I'm happy to be the one to tell you you're more capable than you think: If you were a COBOL programmer you'll find DLLs in PowerBasic a snap. (Hey, I myself wrote thousands of COBOL lines of code in the early 70's, so I know what I'm saying!) And if you have written any involved Easy Language indicators, then you're practically a C programmer, and you'll have no problem with DLLs. Start now and greatly enhance your use of the NeuroShell Trader!

Why are DLL's so easy? Because there is no need to write input/output code. It is all calculation. You just get data streams from the Trader, and pass back an output data stream. No worries about dialog boxes, windows, or the like. It's a well defined clean environment to work in. Try it and see.

Any suggestions on what outputs to use that would benefit from optimization?

i have adaptive turboprop 2 addon that i purchased several months ago but just started using. it has an pretty good example that seems to do well with the fft fast fourier indicators. previously i didn't get much from fft but with at2 it works well even when no hiddens are put in the at2 nets. at2 help file says no hiddens is linear regression meaning it hasnt even gotten to the point of building a net and already good results. has anyone else had any experiences with fft outside of at2?

Re: fast fourier

Date :2/15/2001 8:12:35 AM Poster : chris wong

for outputs i just used change in open, which is the same one that was used in the examples that came with at2. the parameter that gets optimized is change over what period. but then theres another lookahead period that optimizes too. i think you could use percent change too if you wanted or some stochastic.

On 2/13/01 9:28:22 AM Xprogrammer wrote:
I just purchased AT2 also but I have been concentrating so far on some of the other aspects. Not being an engineer, I don't know much about FFT. I have been interested in verifying the capabilities that the Neuroshell web site touts, like being able to optimize the output, number of hiddens, training set size, how often to retrain, and how far ahead to predict. Being an old (literally!) Neuroshell2 user, I understand the old neural nets pretty well, and I had even thought myself that NST should have had that flexibility before. I even considered programming backprop in a DLL, but my programming experience dates to the COBOL days. Have you done any optimizing of outputs yet? Any suggestions on what outputs to use that would benefit from optimization?

Wanted: A Programming Language for NST

Date :2/18/2001 5:07:24 PM Poster : Gary

I believe the NeuroShell Trader has changed. At first, it was merely a program to make it easy to use neural nets. Then, it got the genetic algorithms. Now it has a fuzzy logic add-on. NeuroShell Trader is becoming an all-purpose AI platform for the advanced trader. However, if the advanced trader is the target market for NeuroShell Trader, then it should be realized that an embedded programming language is necessary. Steve is right in telling us not to be afraid of DLLs, and encouraging us to try to C language and PowerBASIC. But nothing quite takes the place of language that is part of the program. It would be more tightly integrated into the functions of the program and debugging would be quite easy. To this point, a trading language has been mainly the domain of TradeStation. In fact, a halfway competent trading language is its main feature. But we should note that it is about the level of Turbo Pascal about 20 years ago. In terms of core functionality, TradeStation really hasn't improved for quite a while. And it is still the most expensive program there is in its field. And now the newest version wants to force us to use its data, and perhaps ultimately its broker. This is unacceptable to many people. I, among others, would be looking for a substitute. NeuroShell Trader would more than fit the bill if it had a trading language as part of the package. A few years ago, I got so frustrated with TradeStation that I sat down with Visual Basic and started to write my own programming language for trading. It was mainly Visual Basic, with several specialized routines included. It was not quite the equal of Easy Language, but it was after all just a hacked creation of one person. What surprised me was how easy it was to do such a thing at all. I wondered then and even now why no one has ever provided really good competition for TradeStation (though MetaStock has come close). It has more to do with the commercial side of things rather than technical feasibility. It requires an established player to take on No. 1. Like NeuroShell Trader for example. In my opinion, if NeuroShell Trader had a programming language, it would be so far superior to TradeStation that I and many other people wouldn't even bother looking at TradeStation. Only so much can be done even with artificial intelligence in simply banging indicators together. We need to be able to easily express any idea we can think of. Is it possible to have some way to do this that is at least as good as Easy Language? Certainly! For example, wouldn't it be nice to have a programming language that is also an expert system, the one missing piece that NeuroShell Trader doesn't have? To think of the possibilities is amazing. As is the difficulty -- in any case, I would hardly expect to see NeuroShell Trader with any such improvements in immediate future. Yet the idea of NeuroShell Trader as the unparalleled platform of choice for the advanced trader, AI or not, is compelling.

Re: Wanted: A Programming Language for NST

Date :2/19/2001 6:20:19 PM Poster : Michael Stigall

I said the same thing several years ago, when WS still taught NST training sessions in Florida. At the time, I recommended a scripting language to not only add new indicators, etc. (such as your programming language) but also to automate tasks within Trader. Each night, I update several neural nets and look for various criteria. I may decide to retrain the net and/or retune the trading system. I'd also like to rank the various neural net outputs (% change, 5 days out) to see which stock may move the most (percentage-wise). I still use Excel spreadsheets to track most of this on a daily basis, since I don't have the time to fiddle with PowerBasic now. I'd like to see a tool which would allow NST to kick off the stocks I'm interested in once their end-of-day data is updated, train several nets at once, save formatted output results from each training session and then rank the results for me in the morning.

Perhaps as I get older, I'm also getting more lazy <grin>. I could try to code something in PowerBasic to perform the daily chores, but I also need to control the operating system (multiple windows with NST running several stocks at once), interface to other applications (Global Server or other databank), and also allow me to create ranking indicators for the reports (which it can probably already do).

Re: Wanted: A Programming Language for NST

Date :5/16/2002 4:37:42 PM Poster : Dave Hubbard

I couldn't agree more. Trade Station really disenfranchised many of the old users in the last couple of years. You guys have made a great product and could really give Trade STation a run for their money if you made a programming language for NST that could enable us to be more flexible with our systems and money management strategies! Perhaps even try to become compatible with all of TS's solution providers.

Hi,
I totally agree with Gary. A good idea will be to use VBA as a programming language, like Microsoft has used for MS Word and Excel. The user can then call COM objects from NeuroShell Trader, not just DLLs, to do what ever he wants to do

Thanks
-Victor Chu

Congratulations to NST user

Date :2/22/2001 10:07:41 AM Poster : Ward.net Webmaster

Congratulations are in order to Scott McCormick who did so well with the help of NST that his story took a whole chapter in a new book. We thank him for revealing how he did it and giving away some of his techniques. See www.neuroshell.com for details.

real-time forecasting -trading; comments

Date :2/23/2001 6:31:31 PM Poster : Syl

Dear friends

Do you have any practical example of a working real time neural net ?

It seems that the AT2 does not work at all even if optimized for real time trading but the the Pred Wiz works just fine but must be retrained manually at each n period.

Did anyone had some success with the AT2 or other AI algos ?

Thanks

Syl

Intraday Momentum Index Formula

Date :2/24/2001 4:22:40 AM Poster : Daniel P Lyons

Hi all,

does anyone have the formula for the following technical indicators originally developed by Tushar S Chande:

Intraday Momentum Index
Variable Length Dynamic Momentum Index
Chande Momentum Index

I would like to code them into a DLL function for testing with the genetic algorithms.

Thanks in advance,

Daniel

SPY

Date :2/24/2001 2:06:05 PM Poster : Maxwell Craven

Does anyone know why I get 5 minute bars for SPY until 4:15 EST? Is it delayed 20 minutes or something? If so, how does that effect trading this stock?

(Actually you have to select Account Mgt. instead of My Accounts, even though after you select the former it says you are in the latter!). However, I'm still confused, because other Amex stocks do end at 4PM and don't go to 4:15 like SPY does (at least those that have enough intraday data to fill the day). Have you any idea why the other amex stocks don't go to 4:15 too? Furthermore, Spy actually starts with the 9:05 bar like the others do, whereas I would assume it would also start 15 minutes late.

Problem with Stops in Tader

Date :2/27/2001 5:30:12 PM Poster : Cantley

I'm having trouble implementing a stop strategy in Trader, and hopefully one of you folks will have a throught. I just can't figure out how to do what I'm trying to do, because the "Maximum Value" function only accepts integers for the window size. (Note to WSG: you need to allow indicators as inputs for some of these functions!)

I would like to be able to take the maximum value of a function since entry into a trade and use it as a stop. For example, a moving average minus a normalized volatility. For a long trade, I'd like to be able to use something like that as a stop.

It's entirely possible that I'm missing something obvious. Anyone offer some help? Or do I need to get a programming language and write it on my own?

Best,
Steve

It took me a while to figure out that I needed to not use the "since filled" version (which is what intuition would have had me use) but things are working the way they look like they should now, and my first attempt at a "real" trading system using this sort of stop is home training right now. Thanks for the new functions!

Rather than use some formula for the stop, why don't you use that criteria as an exit criteria? That way you can program anything you want. After all, a stop is just reason to exit, and there is no real difference from that and any other exit criteria, except that a stop is a fairly rigid and mathematically mechanical way of doing it. But, I could be misunderstanding why you want to use it that way. If so, please post a more detailed explanation.

That is what I do too. After Steve's encouragement that programming dlls in basic is not harder than programming Cobol and Easy Lang, I am starting to experiment with generating my entry and exit signals in a dll too. My ideas for buying and selling are too wierd for any conventional indicators anyway.

Entry signal

Date :3/9/2001 9:30:45 AM Poster : Xprogrammer

Sure, Randy. Below is a simple one I built. It generates a buy signal whenever the close is higher than the open. This was just something I started with, but it's better to start easy. I just used Ward's examples to get me going. This can be used in a trading strategy as a long entry rule. The first line is pretty much just scary looking boilerplate that sets up the name of the indicator and the names and types of parameters that will be sent to it by NST. There are two parameters, cl and opn. BYVAL... AS DOUBLE is kind of a standard number type that NST can provide. (We programmers use scary looking notation like that in order to maintain our job security.) Then the code just returns a 1 (true) if the close is greater than the open, otherwise it returns 0 (false). When BuySignal is inserted as a long entry rule in NST, a buy signal gets put on the chart whenever a true is returned.

```
FUNCTION BuySignal ALIAS "BuySignal" (BYVAL cl AS DOUBLE, BYVAL opn AS DOUBLE) EXPORT AS DOUBLE

If cl > opn Then
BuySignal = 1
Else
BuySignal = 0
End If

End Function
```

Re: Entry signal

Date :3/9/2001 7:47:10 PM Poster : Randy Brown

Thanks, Xprogrammer. It looks like a little effort to learn the language might be worth the increased flexibility to test all the weird ideas that I come up with.

Re: Problem with Stops in Tader

Date :3/8/2001 11:13:49 AM Poster : Cantley

The answer has to do with whether you want to exit at the stop price, or exit at the open the next day. I'm not using the DayTrader, I'm using Trader Pro. I want to exit at the stop price. So placing it as an exit doesn't work right.

With the new functions that have been added in 3.2, I can do the exit right. I'm experimenting with a volatility exit. Close +/- ~3 ATR as a trailing stop.

Best,
Steve C

On 3/7/01 8:56:27 PM Scott McCormick wrote:
Rather than use some formula for the stop, why don't you use that criteria as an exit criteria? That way you can program anything you want. After all, a stop is just reason to exit, and there is no real difference from that and any other exit criteria, except that a stop is a fairly rigid and mathematically mechanical way of doing it. But, I could be misunderstanding why you want to use it that way. If so, please post a more detailed explanation.

Scott

Seminars and other training material

Date :3/2/2001 12:21:27 PM Poster : Ian Orbell

Hi everyone,

Firstly, this discussion forum is great! I log in 2 or 3 times a week to see the latest input, and often find items of interest. So thanks to all who contribute, I hope to add some more comments of my own in the near future (I took a break since some comments back in October).

My question is...for those of us who never managed to make it to the seminars in Florida is there any way we can get the training material (for a price of course), or will the seminars or some similar event be planned for the near future? I have been avidly printing many of the forum emails, and reading all the separate help files, and going through the supplied examples. But I am sure there were many other aspects of the seminars that would be a significant extra eduation to even all those sources. I realise that the training material will not have the benefit of anecdotal input from other seminar attendees. Ian

Now that release 3.2 is debugged and starting production we will be turning our attention to training. We have something a little different cooking you should like which we will try to announce by early April. Stay tuned.

I hope, selfishly maybe, that it can be organised around several levels (Newcomer, Advanced, Programmer,...) for those of us who have attended the seminar already, and even better, with a early morning session from 4AM to 10AM for jet-lagged Europeans like me. Just kidding... :)

Bruno

Hi,
Can I just back up Ians request I am based in the UK so travel and attendance to any US or indeed London based Training is not an option-I also would love to see some manuals/training guides to help us get the best from practical application of the great features in Neuroshell-I am at the stage now where I am able to do the basics but would love some guidance about using some of the tools in a more practical application.A book or manual would be great as it is easier to refer to -or a CD based interactive type training.Look forward to seeing what you guys have up your sleeve.

We missed our early April date, but we are still close to announcing something we think many of you will like. Give us about 2 weeks more and we should have some information. We'll post the information here first, so please stay tuned a little longer.

We can now dicuss the new training concept we have cooked up. There will be more details in our May email newsletter, due out any time now, but here is the overview:

The new concept is one of online courses, called AI College(tm), where you can take a training course on the web any time you want in the privacy of your home or office. In addition to slides on the web, there are audio clips and video clips which are mailed to you in advance and installed on your computer with a special purpose browser. (They are too big to be downloaded). There will be a special forum for class discussions, and email communication with the instructor(s).

There are those who will be very happy with this new concept, especially our users in Europe, Asia, and Africa, and our users who have trouble getting away for a few days. Tuition will also be less. However, for those who feel there's nothing like an in-person seminar, we still plan to have those in the future as well.

The first online course will be an Advanced Course for the NeuroShell Trader Professional and DayTrader Professional. The May newsletter has a few more details or you can read more at www.aicollege.com. We hope you like what you read.

PS: If you have changed your email address lately and didn't tell us, you won't get the May newsletter. Email tech support with your new email address and ask us to update your record in our database.

Webmaster, re: Real-time Feeds/DataX

I was so relieved to read your e-mail regarding the future enhancements to NST and in particular the building of an interface to aid the capture intra-day tick data.

Presumably this will either supersede DataX or be an enhancement to it.

My request in an earlier posting for a refresh method for data sent to the NST can therefore await the development of your interface.

I completed my own system of sending data to the NST, but decided that the second option of updating CSV files was simpler and more rather than the DataX route, until such time as the refresh exists.

To this end I use my Visual Basic DDE client to send data to an Access database from the day trading software I trade with. Every minute a set of queries manipulate the data into the High, Low, Close and Open format.

For the sake of speed, I coded an ActiveX control of my own that updates end of-day and minute-by-minute data in CSV files.

It would be better to call a method at this point to ask NST to refresh the loaded CSV data (re-load the CSV data) rather than have to close down the model and re-open it but this is a small price to pay for what is now a very good system that allows me to execute the best trades possible with the minimum of slippage.

One last point. When your new interface is available I will be able to extend the scope of this analysis from indices to stocks using the alarms built into NST. I look forward very much to its release.

Ergo

I've had a very quick look at the AI College site. I understand that there is a fixed time in which to complete the course after which access is not allowed. What is unclear to me is what reference material, if any, would be available to me after the course completes.

Please advise if I would retain any course material for future reference.

Thanks

John

John -

You will be able to retain the video and audio clips, but you'll have to print the slides to keep them. After the 45 day class period, you won't be able to login any longer, but you could still play the clips while looking at the printed slides offline.

Questions on Jurik Research indicators

Date :3/12/2001 8:54:08 PM Poster : Michael J. Begley

I am considering purchase of Jurik Research indicators and have some questions for the group. I have read through the past threads on this and will summarize what I got out of it. For the record, I mainly use Excel and Tradestation to create trading models today but would like to use NST in the future.

Implementation of the Indicator: If I use the "Programmer's Generic DLL" form of a Jurik indicator, I would then be able to use this in NST by creating a template for it. This appears to be the best route to take since this would allow use of NST's GA to optimize parameters. I have not created any NST templates yet but it does not look hard even for a non-programmer. On the other hand, the "Tradestation" version of the indicator could be imported to NST but a prior post suggests that I would lose the ability to optimize the indicator parameters in NST with this approach. Is my understanding correct on these points correct?
If I want to continue to develop trading algorithms in all three environments (Excel, TS and NST) it appears I am going to end up buying all three versions of each indicator I use. Does anybody see a path to reducing the number of versions needed for these three environments? I am not a programmer but it is difficult for me to believe that 1 dll could not have served all three of these environments.

Which indicators are useful? The indicators that seemed most interesting to me were:
JMA - Jurik Moving Average: In this and other forums there seems to be almost universal support for this.
VEL - Ultra-smooth Velocity: Not much discussion on this in this forum. Any recommendations?
CFB - Composite Fractal Band: Jurik suggest this is useful as a measure of trend strength. One poster in this forum suggests it did not work for him. It seems to me that a good target for a neural net would be to forecast the change in the CFB. If the trend is forecast to weaken significantly, you may want to exit your market position. Has anybody tried this or any other uses? Any results - positive or negative?
RSX - One negative post and one positive. Any other results - positive or negative?

I appreciate any experiences and suggestions you would like to share. Thank you.

Mike Begley

DLL SDK

Date :3/15/2001 4:48:29 PM Poster : Ergo Mann

Thanks for the DLL SDK.

I successfully coded in C++ a complex DLL that took a lot of resource under Excel to calculate.

Now I am able to fully automate a specific feature of my trading.

Thanks again.

Ergo.

It is a very cool tool, and is based on the Pascal programming language, simple to learn and use. And this variant of Pascal is Object Pascal, so you can use all those OO stuff that you can use with C++. Ward.net has a Delphi DLL example which you can download and study. Happy programming!

Forum reorganization

Date :3/17/2001 10:50:13 AM Poster : philippe bousseau

Dear Warsystem,

Your forum becomes difficult to consult when it is about searching for former articles. The Titles don't correspond always to the topics and certain categories contain too many messages (cf. S&P Prediction).There are too many categories besides and those are not classified here by themes.

Before the abundance of the messages (witness besides of a good health of this site) a reorganization of information could be useful.

How to simplify?
Date :3/30/2001 9:23:07 AM Poster : Ward.net Webmaster
We looked into how to fix the problems of too many messages and categories, and poor classifications. We concluded we didn't know what we can do about it. The multiple messages are caused by the forum's automatic inclusion of the previous message, which we thought makes it easier to understand the context of the new message. Of course, forum users can delete these previous messages if they think the context is clear, and maybe they should more often, as we have done with this post. The users put the topics on the message, and we aren't sure it is our place to change them or do any reorganizations (not to mention the immense amount of work reorganizing would require of us!) Perhaps users can be more careful about making sure the topics fit. Remember, you can change the topic and the message will still fall under the thread you are replying to, as we have done with this post. If you have other suggestions post them here.

> ***Re: How to simplify?***
> Date :4/2/2001 12:54:13 PM Poster : Texas Bubba
> Actually, I was lost when I read your post, because you deleted the previous message, AND you changed the subject line. So it was real hard to place, old buddy! I'm not too sure those are such good ideas all the time.

other categories in the Data sources
Date :3/18/2001 12:54:29 AM Poster : philippe bousseau
It would be interessing to be able to create other categories in the Data sources wizard. As example if I have some EOD in the Metastock format, I can recover my data only in the miscellaneous instrument, with therefore mixed pell-mell of the files texts and files metastock.

best regards

If you name your folder with one of the kewords, it will get defaulted to that category when you map it. So if your folder is named "Gold futures" it should get defaulted to the futures category, but if you name it "Gold stocks" it should get defaulted to the stocks category.

Free languages
Date :3/19/2001 6:05:02 PM Poster : Gary
It has come to my attention that there are two languages that may work with NST. They are free in their basic versions. I have not tried them yet -- time constraints -- but will do so and invite others to investigate also.

Squeak -- A version of Smalltalk 80

Kicks out C code. You need C compiler of course to make DLL but don't have to mess with C.

www.squeak.org

Dylan -- Simple son of Lisp, claims great power

www.functionalobjects.com

Maybe as good as the big boys. Will do a DLL.

Hi,

I remember using LCC some long time ago, and I found it on Yahoo. I guess it is still free:
http://www.cs.princeton.edu/software/lcc/index.html
http://www.geocities.com/SiliconValley/Heights/9069/index.html

I don't claim to be very good at C/C++ I find C++ often easier to use though, and for many reasons which would bore traders to death. So to make it short, there is virtually no need to work with classes to develop NST Addons unless you really want to challenge the Trader itself ;-)

And as I said before, the data streams are provided by the Trader, and using pointers is quite straightforward and well described in the SDK. So, C is more than good enough for the job.

Bruno

C++ compilers by definition are suppose to be able to compile C. The creator of C++ intended C programmers to SLOWLY migrate from C to C++. Add a class to your next project, try encapsulation on the next, maybe iostreams etc. He was surprised when people dropped C and went completely to C++. My brother does full time C programming but compiles his code in Visual Studio's C++ compiler.

Now...where's that SDK....

QFeed - is it reliable?
Date :3/20/2001 6:58:12 PM Poster : Michael Begley

I am considering the real time version of NST which requires QFeed. There seems to be considerable grumbling at the following forum regarding the reliability (or lack therof) of their quote servers. I believe that QCharts uses the QFeed servers.

http://groups.yahoo.com/group/qcharts/messages

What are the experiences of NST users regarding QFeed quote server reliability, dropped conncetions, 20 minute gaps in security prices, etc? I am hoping what I read is not real!

I understand the reason Ward Systems chose QFeed was the availability of intra-day data for backtesting. However, the real time quotes have to work as well.

Thanks for your comments and experiences.

Mike Begley

Re: QFeed - is it reliable?
Date :3/21/2001 8:46:43 AM Poster : Maxwell Craven

I have found that when I need to download historical data from quote.com, I should do it before or after market hours. If I try it while the market is open, it is sometimes very slow. I imagine priority goes to real time updates. I haven't found the real time updates to be much of an issue. I personally think some of the problems people have seen might be due to overall internet congestion, which I noticed especially when Napster was about to be shut off. I guess every kid was getting their music before it disappeared. Quote.com does seem to have some growing pains, but in their defense I'll say they seem to have added quite a few servers since all of we NST users started logging on.

In the Omega Tradestation Pro thread Steve Ward posted in January that Ward Systems plans to support the Universal Market Data Server. They have satellite feeds, which should be a lot more reliable than internet. So maybe if Quote.com doesn't work out the way you want you can switch to DTN or something.

I have been using Qfeed for along time and it is the best service I have found so far for the price. I rarely have any connection problems and when I do QFeed and Qcharts find a new server automatically. At this point they are my favourite for intraday and historical data.

In the Omega Tradestation Pro thread Steve Ward posted in January that Ward Systems plans to support the Universal Market Data Server. They have satellite feeds, which should be a lot more reliable than internet. So maybe if Quote.com doesn't work out the way you want you can switch to DTN or something.

On 3/20/01 6:58:12 PM Michael Begley wrote:
I am considering the real time version of NST which requires QFeed. There seems to be considerable grumbling at the following forum regarding the reliability (or lack therof) of their quote servers. I believe that QCharts uses the QFeed servers.

http://groups.yahoo.com/group/qcharts/messages

What are the experiences of NST users regarding QFeed quote server reliability, dropped conncetions, 20 minute gaps in security prices, etc? I am hoping what I read is not real!

I understand the reason Ward Systems chose QFeed was the availability of intra-day data for backtesting. However, the real time quotes have to work as well.

Thanks for your comments and experiences.

Re: QFeed - is it reliable?
Date :3/28/2001 1:38:08 PM Poster : Maciej

I'm using Quote.com real time feed for both EOD and real time - it's been pretty reliable for pratically all the time. The only occasion when it stopped was for the first time a few days ago when they announced a 1/2 point drop in interest rates when I did not have it for approx 30 minutes; my other feed MyTrack also had problems. As I trade futures, its a bore updating the list of futures but Steve Ward's looking into that.

Hi - How are you updating the list of futures? Totally manually or have you come up with a better way that you could share with us? Thanks.

I checked out squeak and Dylan. They are interesting but complex. I have to agree: For NST purposes the most user-friendly and cheap (if not free) alternative is Delphi.

JMA tpl file

Date :4/4/2001 5:53:53 PM Poster : Tagster

Is the tpl available for implementing JMA's DLL for use in NS DTPro.
It had been mentioned in earlier posts but I am unable to find it. Just starting out in Power/visual basic comming from easy language. Still in a fog with respect to DLL
Thanks

Re: JMA tpl file

Date :4/9/2001 4:52:59 PM Poster : Ward.net Webmaster

Our user has sent us his files to implement the Jurik indicator within the NeuroShell Trader. The file is a ZIP file which can be downloaded at:

http://www.ward.net/downloads/toward.zip

The file contains:

(1) nt_jinds.dll
(2) jma.tpl

Extract the files to your \NeuroShell Trader\Template directory.

You must have the jrs_32.dll from Jurik Software Research where the actual JMA routine resides. The user's routine in nt_jinds.dll just calls the JMA routine and blocks out the first few values.

Special thanks goes to Victor Chu for his time and generosity in coding and providing these files.

Re: JMA tpl file

Date :4/17/2001 11:52:36 AM Poster : Victor Chu

Hi Maxwell,

There are two main reasons why I use nt_jinds.dll to call JMA
(1) According to the JMA programming manual, the first 30 values from JMA are not part of the actual JMA values and should to be ignored.
(2)The interface to JMA contains Windows specific types like DWORD, which I am not sure could be called directly by Trader. Hence, to make things safe, I wrote nt_jinds which in turn calls JMA. Perhaps you can create you own tpl file that calls JMA directly. It might work but the first 30 values will be displayed.

If you want the source code, I will be glad to post to the webmaster.

Thank You
Victor Chu

Re: JMA tpl file

Date :4/18/2001 12:17:50 AM Poster : Chris Niemann

Hi Victor,

Thank you for your contributions. I noticed the smoothness or (length)
is limited to values from 0 to 100. It seems as thought the tpl has that input type specified as a percentage value. Is there a reason for limiting the range of inputs in this regard. Larger values can come in handy. I will often use MACD type indicators using very large values to provide longer term information to 15 minute charts.

Thanks again
Chris Niemann

Hi Victor,
thank you for the JMA dll & tpl, very generous of you. If your offer still stands I would be very keen to see the source code for them as I would like try and write dll's for Jurik's other indicators, VEL,RSX, & CFB. (What language do you use? I am very new to all of this "dll" stuff)

DO you use these other indicator's.

I am also very interested in Jurik's WAV & DDR products I think they would be of great help in preprocessing data for NS, have you seen them? I think that it would be quite difficult to program a dll to call them directly into NS.

Thanks Victor,

Garth (from Australia)

Hello Garth,

You certainly can have the source code, it is written in the C language. I have written the dll for some of other Jurik's indicators VEL, RSX, CFB and WAV too.
I will be sending the source code to the Web Master this weekend, so most probably you will get the source code by early next week.

Thank you
-Victor Chu

Hi Victor,

Thank you so much, you're a life saver !!!!! I look forward to seeing source code for your dll's for Jurik's JMA, VEL, RSX, CFB and WAV.

Very interested to see how you have got NS to call the different outputs of WAV.

Have you been able to make it so that NS can utilise CFB to modulate the period of the other indicators such as RSX?

Best regards,
Garth White

Has anyone ELSE had trouble getting or staying connected with quote.com?

Re: quote.com
Date :4/17/2001 4:18:33 PM Poster : Ward.net Webmaster
We heard from a user yesterday (April 16) who said quote.com was having a major problem, according to quote.com technical support. We notice this afternoon (April 17) there are problems again. They must be having the same problem.

Here is something you can try when you believe only certain quote.com servers are acting up. Please post here if it works for you, because we aren't sure if it is a good idea or not (we don't have access to quote.com internals). It may work when only certain servers are having problems, but probably not if the whole system is down:

There is a file in the Trader folder called ContinuumClient.ini. You can modify it in a text processor, but do it only while the Trader is down. It contains a list of quote.com servers, and you can try putting the list in a certain order if you think some servers work better for you than others. However, the list will only remain static if you set:

AutoUpdateServerList=false

If you set it to true, then the list is updated by quote.com. Of course, if you never set it back to true, quote.com might add new servers your system will never find out about. So be careful with this; we aren't sure ourselves of any ramifications! Let us know what works for you.

Hi all,

I have uploaded a set of files to Support for connecting to Quote.com. The programs were made available via the QFeed and QCharts user groups.

If ever I have trouble connecting I use this program to activate NSTP. The program is self explanatory and has some documentation with it,

regards,

Daniel

The good news: We tried this program and it seems to work very well. It seems to allow you to select which server to use, while telling you which ones are responding the fastest. We don't suggest that you use it unless you are pretty competent with Windows, however.

The bad news: We have elected not to post the program because at this time we believe that it is a commercial program sold at www.dynastorelight.com. It looks to us like they have a 15 day free trial, and the price is reasonable. Go to the box on the left and select quote.com (qfeed).

If more people try this program, please post your experiences here.

Here is the details from DynastoreLight....it does say "free" in the QFeed Forum as listed in their text message below

//////////
QFeed Server Selector pings available servers and shows the last, min, max and average results for each server.
User may select one or more servers to include them to the resulted ContinuumClient.ini file and to run any QFeed-compatible application using this ini file.

Also user may choose one of 3 available starting options:
- "AutoUpdateServerList=false" - this will prevent your server list from updating by QFeed;
- "AutoUpdateServerList=true" - this will allow QFeed to update your list;
- "Clean Start" - being using, this option will delete your ContinuumClient.ini together with any *.inf files and the contents of TEMP sub-folder. This option is useful for troubleshooting situation.

Server list is saved at the local file named "SERVERS.TXT".
Program also can download the latest version of this file from Dynastore Web.

All buttons and checkboxes have tooltips, so you may move the mouse cursor over any control to see what it is intended for.

The program is free. No guarantees provided.

However, the list will only remain static if you set:

AutoUpdateServerList=false

If you set it to true, then the list is updated by quote.com. Of course, if you never set it back to true, quote.com might add new servers your system will never find out about. So be careful with this; we aren't sure ourselves of any ramifications! Let us know what works for you.

Re: quote.com
Date :4/19/2001 10:38:06 AM Poster : Steve Ward
Today I received the letter below from the President of Quote.com. I suspect it went to all users. Note item 4, and try to help them by not downloading historical data during market hours.

Steve Ward

Firstly, I'd like to thank you for your patronage and apologize for the
recent performance issues.

We have dedicated all of our Continuum resources to resolve the current
performance and reliability problems that exist with our QCharts service.
Due largely to the increased volume generated by the decimalization of the
exchanges, we have hit a hurdle with Continuum's ability to scale during
highly active markets or when operational issues otherwise disrupt the
service.

We are in the middle of a focused project to permanently resolve these
issues which is the number one priority within the Lycos Finance Vertical.

The purpose of this project is to scale Continuum to handle the increase in data flow due to decimalization, to improve the performance of the servers and to increase the reliability of our service. We will see the bulk of these benefits delivered over the next two weeks.

There will also be an ongoing effort to further enhance the architecture of Continuum to meet the increased demand for data, reliability and performance from this product. This effort will address the many issues that we are currently experiencing within the demand for our service.

What has been done:

1) Over the past month we have made marked improvements in the performance capacity of out Quote services. The benefits of these enhancements have unfortunately been negated by the tremendous increase in data being handled by the servers caused by decimalization. The increased volume of bid/ask data being sent by the exchanges due to decimalization requires approximately FOUR times as much data to be processed by our servers.

2) Increased staffing on the Continuum development team, supporting the QCharts product line, allows us to execute faster on these performance issues.

What's coming up:

1) An additional Continuum Server farm will be spun up within three weeks. This will increase capacity by approximately 50%.

2) Incremental performance, scalability and reliability improvements will be released over the next two months, starting this weekend. These additional enhancements will not be counteracted by sudden increases in data as they have in the past, although we do expect continued natural gradual increase of data flow.

3) We have engaged a new Director of Client Services, who will be tasked with improving the level of support and communication within our customer base. This we believe will assist us to enhance service levels as the changes are introduced.

4) We are looking into the pricing of our services to insure that heaviest consumers of data are paying their way without impacting the majority of consumers who use our service. We are seeing a minority of customers requesting large volumes of data, which is being served at the same rate that we charge the normal user of QCharts. This is inherently unfair on the majority of our customers and we intend to address this imbalance.

5) We will be addressing an immediate issue with the volume of option data that is being drawn by a small percentage of our customers, which is impacting our ability to deliver quote data to large bulk of our customers. This will be in the form of a filter that will throttle our delivery of options bid/ask data only during heavy market sessions. This will insure that we meet the needs of the majority, whilst protecting the availability and performance of our service.

6) We will be embarking on a plan that will prevent users from needing to switch between servers. In the past, this has led to tremendous difficulty for us to balance the farms and you, the customer, end up with a service level that is far below expectation. We are telling you of our intention to do this up front, because we believe that you pay us to manage the overall service. We hope that you understand our position. Once this change is rolled out it will allow us to deliver a significantly improved level of service.

We apologies for the length of time that it has taken to address the numerous questions that were raised over the last two days, as it was important that we investigated the root cause of the issues encountered. In the event that you have any questions related to the above, please feel free to contact client services at Quote.com who will be able to assist you.

We appreciate your patronage and are working hard to provide you with the best level of service at a very affordable price.

Regards,
Steven Killeen
President
Terra Lycos(US)

We shouldn't forget that Quote is a paying service and I certainly do not appreciate being left with open positions in the market and my screens going dead on me. On a practical note, NST loses connectivity to Quote.com (window comes up asking if I wish to reconnect) fairly frequently - could Ward automate the reconnection process? Another interesting idea is to poll for a faster server - qlink (Excel access to Quote) does this.

Re: quote.com
Date :4/20/2001 7:43:14 AM Poster : Ward.net Webmaster

Maciej:

Release 3.21 already does reconnect automatically. You can download that release free from this web site. Then go to the Tools menu, then to Data Sources, then the Server tab, then the Setup button. There you will see the auto reconnect option.

Polling the servers is a good idea. It is what Dynastorelight does, and we are looking into it now.

EOD values in Real Time
Date :4/19/2001 5:48:13 PM Poster : Maciej

Does anyone have an idea how I can catch the last tick / 5 minute value when running in 1, 5 or 15 minute intervals? In most instances I can count on the exchange close but this not always the case when handling sparsely traded items such as futures ie take the NQ series - right at the beginning the data is anything but complete. Currently my method is to track the time of day but it does not always work. Using the lead function does not seem a good solution either.

Re: EOD values in Real Time
Date :4/20/2001 11:05:50 AM Poster : Xprogrammer

I may not be understanding what you mean by "catch the last tick / 5 minute value" but I have always thought that the Day Close in the Intraday Basic category was the last tick of the day, after the day ends of course. Isn't that correct?

The Xprogrammer

Cheap data
Date :4/19/2001 9:04:42 PM Poster : Gary

I found an interesting program at: http://lightning.prohosting.com/~darrend/. It downloads stock data from finance.yahoo.com, which is a bit flaky but free. It will reformat it to Metastock so NST can see it. Shareware, $30. Seems to work well enough and certainly good for a backup data service at least.

Estimation of the "true" price
Date :4/20/2001 12:12:59 PM Poster : aorn

I would like to determine the "true" price, which is the "true" state of the market and use divergences from this to enter new positions.

The true price would be calculated as a 11 day centered moving average:
the price you get at time [t] if you average datapoints from time [t-5] to [t+5], i.e.

The problem is of course that today you only know datapoints [t]..[t-5], it is here that the neural network would step in and based on earlier examples could predict the "true" state.

This would be somehing like a neural network based kalman filter.

Any ideas how to do this in Trader?

Re: Estimation of the
Date :4/20/2001 2:33:53 PM Poster : chris wong

predicting the true price for today is really no different than predicting the open or the close for tomorrow. just build a true price indicator using the lead indicator to get [t+1] to [t+5] and the lag indicator to get [t-1] to [t-5]. then predict that zero days ahead. i'd use adaptive turboprop2 addon if you have it because it can retrain every day and keep the window moving forward. use whatever you want for inputs.

Re: BETA
Date :5/1/2001 10:36:52 AM Poster : vince

The BETA of a stock is a risk measure comparing the volatility of a stock's price movement to the general market. Example: if a stock has a Beta of 1.25 it will probably move 25% more than the market.

Re: Monte Carlo Simulations

Date :4/26/2001 6:14:18 PM Poster : Alan Gillies

Hi Texas,
Will do my best but I am sure there are probably people in this forum who are way better versed in this area than me.My basic understanding is that a MCS is a methodology that attempts to use a real random process along the lines of flipping a coin to achieve a non random deterministic result.What a MCS does is apply a very large number of different randomly generated scenarios to your trading strategy or scenario and sees what the aggregrate results are -theoretically this means that you should, using this type of analysis come up with a trading strategy that is able to perform better in all the different types of scenarios that a market may go through and minimises the (albeit slight) chance that when you backtested your strategy it just so happened to fit using the data that you used but may not be something that would be replicated repeatedly.
Probably a very poor description or example and maybe some other folks could do a better job-hopefully though it gives you an idea of what I was referring to.

Alan

Question from a beginner

Date :4/25/2001 12:56:15 PM Poster : Claude Cherel

Hi everyone,

Sorry if my question seems to be basic to those of you who have a lot of
experience, but I need some help and I guess this forum can be a source of answers.

As a new NeuroShell Day Trader user, I have a general problem. I
generaly cannot get more than 40 or 45% of profitable trades in my
predictions. Perhaps I make a mistake but I don't see which one. This is
the kind of prediction I do:

- Look for % change, or optimal % change, or optimal buy/sell on open,
10 minutes in the future.
- Optimization methods: I used all of them (full optimization, parameter
search, input selection and no optimization).
- Inputs: Momentum indicators (AccumDist, CCI, MACD, etc.), but I also
use others (regression, change, moving averages, etc.)
- Training criteria: Max training set 1 week, minimum 2 days, 1
walk-forward test of 1 day.
- Objective: Maximize Return on account, both long and short, optimal
trading rules, optimize on training set
- Trading size: 1 share, no trading costs
- Max number of hidden neurons during training and during optimization: 10

Is there an error? Are the training criteria too large?

I tried this with AMAT and CMVT on 1 minute bar chart. Should I use
another periodicity?

I know I have to test with several stocks, but I want to know if I do
the right things before to go to this following step.

Thanks in advance for your help, every advice will be welcome.

Claude

Re: Question from a beginner

Date :4/26/2001 9:28:46 AM Poster : Xprogrammer

Hi Claude

When you say 45% profitable, are you talking about the evaluation period? If so, then maybe that's the problem. You said walkforward is only 1 day. Seems like that's not much to get many trades going, unless the stocks you are trading are pretty volatile. Why don't you try a week?

Also, when I was a beginner, I didn't start right away with the optimizer, because the Ward group advised against it in something I read. I'm thinking you might be over optimizing because the training set is only a week. Try training with maybe 2 weeks. Try without optimizer, then use only parameter search with a few inputs. That is what helped me in the beginning. Also, Ward advises somewhere I read to use more than just a couple of stocks.

Re: Question from a beginner

Date :4/26/2001 10:55:38 AM Poster : Claude Cherel

Thanks a lot Xprogrammer for your answer, it gives me a way.

When I say 45% I am talking about the Percent Profitable Trades in the Trading Statistics page of the Prediction Analysis. I am concerned about this because if I am not able do make more than 50% profitable trades without trading cost, then I have no chance to make even a dollar with the costs ... I tried to increase my training set and my walkforward test but the result is almost the same.

I guess the last part of your message is THE way! I have to do my predictions with a reasonable number of stocks. This will be my work for the coming days.

Thanks again for you help

here's more things to think about claude. i'm not a statistician but i don't believe that if you flip a coin to decide when to get in and out of a trade that you'll necessarily average getting 50% of them profitable. it isn't the same as getting 50% heads and tails. markets don't always go up or down, or stay up or down until you get out.

furthermore, what if your nets are only getting 45% profitable trades, but the profitable ones are making twice as much as the unprofitable ones are losing? i'll take that any day.

the last thing is to be careful about which net you are clicking on in the training results (walkforward vs current vs outofsample). they all have different stats.

Hi Claude

When you say 45% profitable, are you talking about the evaluation period? If so, then maybe that's the problem. You said walkforward is only 1 day. Seems like that's not much to get many trades going, unless the stocks you are trading are pretty volatile. Why don't you try a week?

Also, when I was a beginner, I didn't start right away with the optimizer, because the Ward group advised against it in something I read. I'm thinking you might be over optimizing because the training set is only a week. Try training with maybe 2 weeks. Try without optimizer, then use only parameter search with a few inputs. That is what helped me in the beginning. Also, Ward advises somewhere I read to use more than just a couple of stocks.

Hi everyone,

Sorry if my question seems to be basic to those of you who have a lot of
experience, but I need some help and I guess this forum can be a source of answers.

As a new NeuroShell Day Trader user, I have a general problem. I
generaly cannot get more than 40 or 45% of profitable trades in my
predictions. Perhaps I make a mistake but I don't see which one. This is
the kind of prediction I do:

- Look for % change, or optimal % change, or optimal buy/sell on open,
10 minutes in the future.
- Optimization methods: I used all of them (full optimization, parameter
search, input selection and no optimization).
- Inputs: Momentum indicators (AccumDist, CCI, MACD, etc.), but I also
use others (regression, change, moving averages, etc.)
- Training criteria: Max training set 1 week, minimum 2 days, 1
walk-forward test of 1 day.
- Objective: Maximize Return on account, both long and short, optimal
trading rules, optimize on training set
- Trading size: 1 share, no trading costs
- Max number of hidden neurons during training and during optimization: 10

Is there an error? Are the training criteria too large?

I tried this with AMAT and CMVT on 1 minute bar chart. Should I use
another periodicity?

I know I have to test with several stocks, but I want to know if I do
the right things before to go to this following step.

Thanks in advance for your help, every advice will be welcome.

Re: Question from a beginner

Date :4/27/2001 9:38:02 AM Poster : Maxwell Craven

Claude:

Maxwell Craven here. Some months ago Steve Ward advised me to be sure to include some subjectivity and common sense in my decisions about when to trade a model. He says he often just eyeballs the results to see if they make sense, ie, no real dumb trades or big drawdowns along with a reasonable profit. I have found that useful advice.

Maxwell Craven

Chris,

Thanks a lot for your input. I generally look at the outofsample result. Is there a special way to analyse all the nets (walkforwards, current and outofsample)? I look for a minimum of consistency in between all of them, is there something else I should look for?

Claude

On 4/26/01 1:55:39 PM chris wong wrote:
here's more things to think about claude. i'm not a statistician but i don't believe that if you flip a coin to decide when to get in and out of a trade that you'll necessarily average getting 50% of them profitable. it isn't the same as getting 50% heads and tails. markets don't always go up or down, or stay up or down until you get out.

furthermore, what if your nets are only getting 45% profitable trades, but the profitable ones are making twice as much as the unprofitable ones are losing? i'll take that any day.

the last thing is to be careful about which net you are clicking on in the training results (walkforward vs current vs outofsample). they all have different stats.

check pages 122 and 123 of Trading Chaos by Bill Williams. I simply added the letters S and P to the MACD for identification puposes only when I was eliminating methods a few years ago.
The SMACD is an oscillator created by Tom Joseph using settings 5/35, which was modified by Bill Williams to use settings of 5/34, whereas the PMACD is a MACD using settings of 5/34/5.

Daniel,

I was reviewing the formula on the CandleStick Indicator page you submitted and there appears to be a discrepancy in the formula you gave and the BlauCSI indicator:

100 * (EMA(EMA(Close-Open,r0,s)) / (EMA(EMA(High-Low,r),2))

yet your indicator is:

BlauCSI(Close,Open,32,32,High,Low,32,32,32,100)

This leads me to believe there is an additional EMA in the denominator of the indicator. Do you perhaps have a corrected formula?

Getting off subject, you mentioned multiple time frames in an old post. Do you have any thoughts on effective ways of combining multiple time-series together?

Thanks in advance

Tom,

Re: Blau, I can provide the template files to support for upload if would like them so you can experiment with them.

There are 4 templates in all and each has its role. They can also be found in William Blau's book, "Momentum, Direction and Divergence".

Re: MTF's. Actually, this is a complex topic and one that requires access to "All Sessions" data in my opinion. Most information on the topic simply discusses merged datasets and overlays which is rather a simplistic view on the subject. Based on my experimentation in other fields such as voice recognition and hand print recognition I designed and built a proprietary method far handling MTFs. This allows me to handle issues such as data alignment in a more complete way. Such issues becomes more relevant when building training sets for nets etc.

regards,

Daniel

Daniel

Regarding MTF: You say "All Sessions" data. Are you referring to sessions outside of the "normal" trading window? Your work using voice and hand print techniques sounds interesting. Are you using these techniques to reduce noise and then combine the time series together? Are you decomposing the signals via wavelets or some type of low pass filter?

I've read papers on merging time series together but the results looked similar to just adding the different time frames together, which I assume is NOT what you're doing. Does the voice/hand print recognition field have mechanisms for merging time series together in a more useful manner?

Steve,

the SMACD and PMACD was supplied courtesy of Bill Williams. The remainder are courtesy of William Blau. The signals for that particular strategy are very simplistic but are fairly reliable.

I only trade futures and currencies and hence deploy several proprietary "leading" indicators for identifying/generating signals. The above indicators are "lagging" indicators but serve a purpose. I believe you require a balance between leading and lagging in order to obtain consistently reliable returns.

I find the NSTP to be excellent for testing indicators and strategies so don't be afraid to experiment,

good luck,

Daniel

Re: DataX
Date :5/2/2001 10:12:13 PM Poster : Ergo Mann
I purchased DataX because I live in the UK and trade UK stocks, options and indices. I do not use/own Omega Tradestation whilst Quote.com does not have the FT-SE 100 index and stocks.

I have a real-time link to a broker via the Internet and also have a real-time technical analysis program that uses DDE to update both the data and the charts. The program the broker has supplied is Market Maker 4.3. My goal is send tick data to the NST from a Market Maker DDE link and have it return a (buy/sell) signal.

Though I have not coded an "NST signal to broker client" I have coded a "trading platform to NST client" and can confirm that it is quite straightforward. I decided against C++ for an easier time in VB5 linked via JET to and Access database file. It took me a day to get reasonable results.

There are three limitations when sending data TO the NST

(i) The user cannot control the date/time against which the data is displayed.

This is easy to get around. You will need a file with each minute (or other time period) and a data value per period. I have to thank the Ward help line for this suggestion.

(ii) The second is that when sending data to the NST only one item can be sent per channel.

Effectively this means sending OHLC across four channels and using each GetData channel as one item either Open, High, Low or Close.

(iii) Refreshing the NST.

Bear in mind that for data coming FROM the NST a flag representing new data is available exists, this is not the case when sending data TO the NST, so a manual refresh is necessary.

Latterly, I have thought that an easier would be to write a piece of code that updates CSV files and leave it to the user to manually refreshed the chart; accomplished by selecting a different time period. Though not entirely satisfactory, I do not trade intra-day but use the NST to provide more precise entry and exit points, this is not a great problem. The stops are exceedingly clear on the NST charts.

Whichever route I proceed along, bi-directional DataX or uni-directional/CSV file, it is quite exciting to that have the ability write a user application that can both receive and send data to the NST. I would ask though for those of us on the wrong side of the Atlantic if an interface could be built to CSV files like the one that exists to for Omega and Quote.com.

Failing that a method in the DataX to ask NST to refresh would be most welcome.

Ergo.

For anyone who is interested. I have setteled on the platform of tools that I will use to build my interface. It will be a Visual Basic application that will have all of the business rules and the interface. It will use the DataX ocx to get the Buy/Sell signals from the NeuralShell and then use JavaScript to talk to DATEK. This should make it very protable (self contained), easy to maintain and easy to install. I made this desicion one the outside chance that someone else might want to use such an application. Well, I will start laying the code tonight.

Thx, for the update Steve -- I'd like to do the same thing somewhere down the line and am interested in anything you come up with.

On another topic regarding optimizations speed.

I have a Pentium 4 with 256 of memory and optimizations have been taking a huge amount of time. For instance last night I set up an optimization of 3 stocks(3 rules & no trailing stops) and went to bed.This morning when I checked it NSDT hadn't even completed one stock. Yesterday I had ordered another 256 meg of RIMM memory. When it got here i installed it and got a QUANTUM improvement in performance. The same trading strategy is almost done optimizing in less than 1 hr with tons of other stuff running in the
background.

Aside from removing disk writes to cache I'm not sure why the difference because it seemed sluggish even with a few programs loaded. There are 4 rimm slots and they all have to be populated. so, if you use 2 rimm sticks, the other 2 slots have to have dummy sticks. the only thing I can think is that these dummy sticks were some how hindering performance because everything is really screaming now, EVEN NSDT

BTW, to the NSDT programmers, Microsoft has a compiler that optimzes programs to run even faster on the P4

DataX
Date :5/13/2001 4:41:12 PM Poster : Steve Kratochvil
Well thanks, I am trying to build something that will be able to trade while I go to the store, if you get what I mean. I am looking at JavaScript because it is DATEK's language of choice on the client and that makes things fit better at first. If I can clearly see a better solution with VBScript I will take it as it fits better with VB. The reason I ntched up on VB to build the "brain" is because the way the DataX ocx can be used in combination with all the complex business rules that I intend to use to control my trades even if the DataX sends or does not send a signal. It does not hurt that I am a VB developer. In response to you question about parsing, I am going to test JavaScript, JScript and VBScript inside the script control. The fastest one will be the one of choice for return information.
I am very interested in the .NET tools and what they might offer in the way of new features and ability. I have not seen them yet.

I wrote a nice javascript interface to trade with datek -- the buys/sells should be doable with dataX to a custom program, but what about the confirms and partial fills. Would there be a way to get this data back from datek? Or would you have to parse the profile/activity page to get the confirms?

Is there any way to use dataX with javascript so I can salvage some of my existing code?

Steve

Intraday chart periodicity
Date :5/2/2001 3:06:45 AM Poster : Claude Cherel
Hi,

For those who use the Day Nst, could you tell me the kind of chart you are using? 1 minute, 3, 5, 30, 60 minutes?

The 1 minute bar chart seems to be short for trading on the web (too many signals and too much costs), can you confirm?

Thanks,
claude

Trading Functions
Date :5/3/2001 1:49:59 AM Poster : Al Martin
Does anyone know how to incorporate the average True range into a trading strategy without custom programming? Is it just me or are their others who would like to see more functions available for use in the trader?

Tx

Re: Trading Functions
Date :5/3/2001 9:56:29 AM Poster : Xprogrammer
Hi Al:

The true range indicator is in the Advanced Indicator Set addon which I purchased from Ward systems. There's some good indicators in it you might want to look at, and I thought it was worth the price. However, there's also instructions on building TR in the ind wiz and the average form of TR I notice on the tips section of this web page. You don't really have to program anything since all the parts of the TR are already there in the ind wiz. Plus, that same tip lets you download one already built if I'm not mistaken. Good trading!

The Xprogrammer

Fresh Look to Forum?
Date :5/3/2001 10:54:53 AM Poster : Ward.net Webmaster
A while back there was a thread called "forum reorganization" where it was suggested that we re-arrange the forum look and feel. We were a little negative on the idea then, perhaps because we weren't thinking in terms of broad enough changes. We're willing to relook at ideas, but we need your help. Please add your "vote" to this thread where you either tell us exactly how you would want to change the look and feel, or vote for what someone else has said. If we don't get much response we'll assume we should just do nothing for the time being.

Re: Fresh Look to Forum?

Hi,

may I suggest the following:

Sites for MFC programmers such as the "CodeGuru" and "Code Project" have discussion forums that categorise the topics based on MFC functionality. For NSTP this could equate to groupings similar to the NSTP menu design. For example:

Data
Calculations
Indicators
Predictions
Trading Strategies
Alerts
Charts
Miscellaneous

It would be up to the individual (or moderator) to try to keep topics within the relevant grouping which I know is difficult at times.

Daniel

I'd be interested in seeing something sort of like this:

Folders for very major headings--perhaps as you have it now, Trader, GA, etc.

Then, specifically for the Trader folder for example, a series of additional folders. Just to throw out ideas, maybe things like: Predictions, Trading Strategies, Cluster Indicators, Integrated Systems, Advanced Topics, etc.

Each of the folders will contain several threads, and the users can start new threads as they need them. The threads contain all of the messages in sequential order, and one can view the entire thread at once if so desired. So someone might start a thread about trading currencies, while someone else starts a thread about problems associated with finding a good stock to trade within the same folder.

This will solve many things. It will solve the need to copy the message you're replying to into the message that you're writing. Doing that solves the 20 levels of indentation we see on some of the messages. It will keep related messages together unambiguously. It will help people know where they need to go to find content on a specific subject.

The old Futuresource site was built sort of like this. It was very convenient. Since we're moderated here, we should be able to avoid the problems that eventually led to Futuresource's failure.

My two cents anyway. Anyone have other thoughts?

Best,
Steve

Re: Fresh Look to Forum?
Date :5/6/2001 4:13:17 PM Poster : Dave Johnson
Several comments on the forum....

(1) It is difficult to organize the topics too much -- over-organization can create difficulties in itself, as one must then decipher where to look. Maybe a few very high level categories, but I don't believe that this is the biggest problem.

(2) The time delay for posts inhibits spontaneous exchanges. If new posts were immediately "posted", then there might be more of an active exchange. JMO. (Also, I don't believe that this is a forum which is very likely to be mis-used. We are a rather select group who need the most constructive feedback possible. If Ward has concerns about potential problems, they can always delete messages later. We as a group can also police any counter productive use of the forum.)

(3) The inability to read through threads with a "next" function is a real pain. Any improvement that allows sequential reading of posts or even reading a whole thread at once would be a huge improvement.

(2) The time delay for posts inhibits spontaneous exchanges.

I agree - the delay makes having a "normal" discussion... well... difficult.

Add to that the fact that you have to type in your name and email for each post (or am I missing something here).

I have posted my suggestions via mail a few weeks ago. Is it totally out of the question to move this forum to a newsserver? In ny opinion, most problems would be history if that could be done. But again, that's just my personal opinion and perhaps not what you want to do.

Basically, I think the way this forum works makes it slower and more cumbersome than necessary to 1) browse available messages 2) see what I have already read 3) get an overview of whats here. Each time I log in I have to spend at least 15 minutes to flip back and forth just to see that oh I already read that last week. As a consequence I visit only now and then, and most often do not post any replies.

If the newsserver concept is not acceptable, I would suggest you consider splitting the forum in one pane for the message headers (displayed similar to today in a "tree" with "plus" icons that expands the thread) and one pane that displays the actual message. Clicking a message header in the first pane would display the actual message in the second pane. Quick and easy, good overview, and the browser will change the color of the headers (links) I have already read.

I think idea of exchanging ideas and having discussions about the software is interesting and great fun. However, the "problems" with the forum takes some of the enjoyment away.

Jonas

Clusters

Date :5/6/2001 4:31:35 PM Poster : Dave Johnson

I have been spending much time trying cluster indicators with both intraday and daily data. I have had numerous cases of trading strategies that optimized very well, with even extraordianry results, but then did not forward test very well.

Typically I have tried clusters with price momentum inputs, MESA inputs, regression inputs (similar to example 4, with lagged regression pseudo-trendlines), etc.

There are two approaches that I have tried so far: First, to use one cluster indicator as an entry signal for long, another for short. Second is to use a set of cluster indicators -- with fewer inputs -- and then require multiple signals for entry. This strategy can then be optimized for "rules" in the strategy.

The best optimal results have come from the single indicator approach so far, but the forward test problem remains.

I have been typically using a small set of stocks for this analysis, but have also tried indices and index futures (foir intraday).

Another issue is that of optimization time. When building a strategy with optimized stop losses, exit targets or signals, etc., the computation time can become very large. (I am running on a 1.2 GHZ athlon with 512 MB).

Anyone have suggestions for cluster strategies that seem to improve the forward testing performance? I am sure that, if I could run more optimizations (cpu limited) I could find solutions, but I don't yet have multiple computers running NSDTP!

Dave,

As Texas Bubba mentioned, I read the tip on the slow optimization and my strategies now are not long to compute. I do not use anymore stops, trailing, etc.

I have just a question, what kind of dates do you use in the trading strategy parameters for: start of backtest, size of backtest and range of data used to optimize trading strategie?
I use the defaults and I get some pretty good results but perhaps it is a mistake and I should not use the defaults?
Do you know?

Re: Clusters

Date :5/7/2001 10:55:23 PM Poster : Dave Johnson

Claude, I am typically basing the dates on the number of bars, limiting it to between 1000 and 3000 bars. This obviously changes the dates spanned depending on the bar size. Then I typically use 15 to 25 % of that length further out as a forward test (backtest in NST speak). I typically use fewer bars for daily data -- as the market personality probably changes over such a time -- and more bars as the bar length becomes smaller.

Regarding the slow optimization, I have had this problem both with and without using stops. I have tried strategies which simply reverse on opposite entries, and others that use stops or more complex entry rules. It can be that the time is sometimes multiplied by the stops, but I don't think this is the essence of the problem.

The question remains...any suggestions of cluster strategies that forward test with about the same success as the optimization?

Perhaps my choice of forward test length is too long, and the optimization should be carried out to a point closer to the latest bar, in order to capture as much of the current personality as possible. Thoughts?

Thanks for the responses from Tex and Claude.

Re: Clusters

Date :5/8/2001 1:46:39 PM Poster : Maxwell Craven

I get results with clustering that carry forward better when I use fewer "inputs". In that respect, I suspect that they are like neural nets, that you can overfit if you use too many. Maybe that will speed up optimization for you as well. What often helps for me is trying a different set of equities.

Regarding the slow optimization, I have had this problem both with and without using stops. I have tried strategies which simply reverse on opposite entries, and others that use stops or more complex entry rules. It can be that the time is sometimes multiplied by the stops, but I don't think this is the essence of the problem.

The question remains...any suggestions of cluster strategies that forward test with about the same success as the optimization?

Perhaps my choice of forward test length is too long, and the optimization should be carried out to a point closer to the latest bar, in order to capture as much of the current personality as possible. Thoughts?

Thanks for the responses from Tex and Claude.

Dave,

As Texas Bubba mentioned, I read the tip on the slow optimization and my strategies now are not long to compute. I do not use anymore stops, trailing, etc.

I have just a question, what kind of dates do you use in the trading strategy parameters for: start of backtest, size of backtest and range of data used to optimize trading strategie?
I use the defaults and I get some pretty good results but perhaps it is a mistake and I should not use the defaults?
Do you know?

Claude Cherel

Dave, as I mentioned to the other guy earlier, the Wardgroup has put up a new tip called "When optimization is really slow". Did you read that one? Since you have stop losses, it looks to this country boy like you're affected too!

On 5/6/01 4:31:35 PM Dave Johnson wrote:
I have been spending much time trying cluster indicators with both intraday and daily data. I have had numerous cases of trading strategies that optimized very well, with even extraordianry results, but then did not forward test very well.

Typically I have tried clusters with price momentum inputs, MESA inputs, regression inputs (similar to example 4, with lagged regression pseudo-trendlines), etc.

There are two approaches that I have tried so far: First, to use one cluster indicator as an entry signal for long, another for short. Second is to use a set of cluster indicators -- with fewer inputs -- and then require multiple signals for entry. This strategy can then be optimized for "rules" in the strategy.

The best optimal results have come from the single indicator approach so far, but the forward test problem remains.

I have been typically using a small set of stocks for this analysis, but have also tried indices and index futures (foir intraday).

Another issue is that of optimization time. When building a strategy with optimized stop losses, exit targets or signals, etc., the computation time can become very large. (I am running on a 1.2 GHZ athlon with 512 MB).

Anyone have suggestions for cluster strategies that seem to improve the forward testing performance? I am sure that, if I could run more optimizations (cpu limited) I could find solutions, but I don't yet have multiple computers running NSDTP!

Re: Clusters

Date :5/7/2001 8:52:47 AM Poster : Ward.net Webmaster

To all: Speaking of running multiple computers running NSDTP, we are now able to offer a 40% discount off list price on second, third, etc. copies of the Trader, Trader Pro, or DayTrader Pro that you purchase for yourself or at your same company!

We could all use more structure in our approach. AI trading systems development is both an art and a sceince. You should look to cultivate or adopt some form of market philosophy. There are many types on this board subscribing to different views on what moves a market and how to capture that information for forcasting price movements into the future.

For one it helps to have an idea of what role each indicator or input plays into your overall approach. Giving the GA free reign is far from a reasonable solution.
(you should have an idea of the parameter ranges and indicators that fit a particular role.) - I love the add ons!!!

The relationships between a system and a market are complex and go beyond what we see in the analysis window (the scientific approach). Visual inpection of the signals provide insight into the thinking behind the buy/sell signals (the artistic approach). It is best to try to integrate these two when trying to create a meaningful system.

As far as a system that has %100 winners I would be extemely sceptical of it. Markets are not perfect and systems are far from perfect. Look for meaningful errors, smart trades that lost money. Markets demand a flexible approach this is where the art comes in. Scientific methods are more rigid and are best for creating the framework or basic structure for an overall system or approach.

Cautionary note - When we engage in visual inspection be well aware of the fact that our eyes naturaly wander to the big moves and great signal and often completely ignore periods where the system gets chopped up. As far as the big moves goes:
Who's system isn't firing when Ciena it gaps up 6 points.
The best systems put on smart trades in quet periods. See my post on filtering bad trades, I made today as a separate issue. Knowing when not to trade and why can be as important than knowing when to trade.

Personaly, I am on the artistic side and trying to work toward the analytic. (the first month I had NSDTPro I was affraid to even open it. To this day I am still affraid of dll's and VB code, even though I have a handle on easy Language. For me it is simpley a mental block I will overcome by necessity as I need to code more involved ideas.

I would also like to add my vote to update the look and feel and possibly the background color. It is, however, soothing.

Hello,
Isn' t a system good enough when in out of sample period of 12 months most of the "intermediate size" tops and bottoms are hit? A look at max draw down in back test and out of sample also helps

aint that good enough?

Yes, we are working now to support the Universal Market Data Server (www.uniserv.com) and TradeStation Pro. One problem we and the whole industry has is that besides TS Pro, we know of no other server that can deliver more than a little bit of historical data through the connection. You need historical data to build neural models and backtest traditional models.

If you think the delay is because they haven't marked your account as real time, you can check that and correct it on their web site.

If you think the delay is just overload, you may want to read some of the suggestions on these previous threads: "quote.com" and "Qfeed - is it reliable?"

I have had continous problems with slow data from qcharts. ask for 1 or 5 min and nothing--go to 60 min get a chart then go back hit 5 min and wait but get something after a long wait --20-30 sec. This is not realtime in my mind. I also use quote.com realtick at a daytrading floor and the updates are virtually instantaneous. I have qcharts for one reason NST. I would prefer to have a choice of a reliable service because the speed of updates is making NST useless compared to just looking a screen and deciding. I use a 700mhz p3 w/512m mem so I certainly should expect to recevie realtime data and compare the machine to what I think --otherwise what's the use I might as well go end of day!
Regards;
JoeD

Data Feed historical limitations

Date :5/9/2001 7:50:00 PM Poster : Steve Kratochvil

I am responding to the Webmasters comment. I have high hopes for the Universal Market Data Server as that will allow me to go back to my S&P Comstock feed which was expensive and worth every penny. But not everyone is ready to pony up to $270/Month just for a data feed. How about an intergration of datasources presented in Tools | Data Sources where you have one assigned to history and it can keep everything up to the last few days and then it merges that with a live feed. If this functionality exists then show me how it is done. I could spend $150 for a "CLEAN" load of my Hit list stocks from Tick Data and use any other feed to just keep adding the new bars to the pile. Besides Quote.com has less than 100% quality data the farther back you go in any given chart. Just an idea.

Self-discipline

Date :5/11/2001 6:20:49 AM Poster : claude cherel

Let's say I get a good trading strategy with more than 70% profitable trades, reasonable drawdown, good number of trades, and good return on account.
When I look at the graph, my mind sometimes does not agree with the generated signals. Then I tend to find perfect buy and perfect sell signals.
Doing so I begin to loose confidence in the trading strategy.

Don't you think that the correct behaviour would be to "stick to the rule", to buy or sell when the system says and not to panic when the drawdown increase in the limits of the trategy? And rebacktest regularly to keep confidence!

Thanks,
Claude

Slow optimization

Date :5/11/2001 12:58:55 PM Poster : Steve Ward

That's a scary hardware problem Steve K told us about on May 10 in the DataX thread. I've heard of computers going into "sleep mode" overnight while they're supposed to be optimizing, but never that!

Below is another few sentences we'll be adding to our tip called "When optimization is really slow." Maybe this will help some of you whose optimizations seem to be dragging, or at least help you know why:

Another reason optimization can be slow is if you are using one of our addons, like Adaptive Turboprop 2, and loading it up with inputs or hidden neurons. The addons are far more computationally intense than the normal indicators are.

For example, suppose you are using Adaptive Turboprop 2 with a training set size of 1000 bars, and you are retraining every bar. Your optimal set contains 10000 bars. This means that EVERY individual in the genetic population has to have 9000 neural nets trained for it on every generation, each with a training set of 1000 bars. Especially if you are using more than a couple of hidden neurons, that can take quite a while, even with our fast nets!

Many of our users like to build a hierarchy of addons. They'll feed Adaptive Turboprop 2 nets into cluster indicators, etc. That's ok, but it produces a whole lot of variables that need to be optimized, not to mention the additional computational intensity.

Filtering Bad Tades

Date :5/11/2001 4:48:39 PM Poster : Tagster

There has been recent discussion about expanding the length of trades to that a system doesn't overtrade. Most of the ideas treat the symptom but might not effectively remedy the problem. Bad trades are part of life. I mentioned in another post to look for meaningful losers when developing a system. The fact that we are attempting to address complex non-linear environments with simple buy/sell threshold has limitations. Down the road we will need to address more complex forms of normalization (perhaps fractal related - any ideas, programmers?).

One way to minimize bad trades is to stay out of the markets more. The flat position is under utilized by most traders. There are simple periods where a market is going nowhere or is going crazy.

Again, probably fractal related, and again welcoming any ideas or input on this matter - hurste, CFB (jurick), Chandre CMO, Commodity Selection Index????
Any ideas? Success stories with these???

The allways in the market philosphy is a curious one. Although it is easy to think about, it is something of a linear approach. The SP500 is a common offender market for traders. Many have a personal vandeta with it. Unless you have consistent success, Steve Ward will tell us that we should look for markets to better suit our models.

Market exist in a multidimensional space. As energy (volotility) expands the geometric confines (boundaries) are tested and typicaly violated. These confines can be illustrated on our charts as trends, support, wedges etc. More importantly these confines exist within our systems and they are continualy being tested in the ways of signal (many of which are bad) - Noise is also where the leading information lies.

The second way to filter bad trades is to have an additional entry/exit rule after a signal is given to validate the move. I prefer "close only stops". Buy if close > high of the signal bar (I'm using intraday). I could do this in Tradestation, I have yet to acheive this in NSDTP. I am experimenting with the trading strategy information in the indicator wizard and setting up two systems, an initial and a validator. It is probably not too hard. I might need some help in this department for the good of the people. Close only stops filter out noise as markets typicaly run for stops. I actualy add a little room like a 1/4 above high , depending on the market

Thanks for listening

If we could set the the stop to be calculated at the close, these highs and lows would be filtered out and the trade could run. When following the trade in realtime you can see these bad prints and ignore the NSDT alerts, but it's a hindrance in optimizing a profitable strategy.

It would be nice to set this with a trailing stop indicator but maybe there's another way to do it too -- If I find it Ill pass it on

In the Price Basic category you can select Price Low and if the price drops lower than the lowest price over the the last n periods you'll get stopped out. This is only a partial solution because if you are fortunate enough to pick the exact bottom as a long entry point you'll get stopped out immediately because the entry price is lower than everything in the prior periods.

Any other ideas?

Steve K

There has been recent discussion about expanding the length of trades to that a system doesn't overtrade. Most of the ideas treat the symptom but might not effectively remedy the problem. Bad trades are part of life. I mentioned in another post to look for meaningful losers when developing a system. The fact that we are attempting to address complex non-linear environments with simple buy/sell threshold has limitations. Down the road we will need to address more complex forms of normalization (perhaps fractal related - any ideas, programmers?).

One way to minimize bad trades is to stay out of the markets more. The flat position is under utilized by most traders. There are simple periods where a market is going nowhere or is going crazy.

Again, probably fractal related, and again welcoming any ideas or input on this matter - hurste, CFB (jurick), Chandre CMO, Commodity Selection Index????
Any ideas? Success stories with these???

The allways in the market philosphy is a curious one. Although it is easy to think about, it is something of a linear approach. The SP500 is a common offender market for traders. Many have a personal vandeta with it. Unless you have consistent success, Steve Ward will tell us that we should look for markets to better suit our models.

Market exist in a multidimensional space. As energy (volotility) expands the geometric confines (boundaries) are tested and typicaly violated. These confines can be illustrated on our charts as trends, support, wedges etc. More importantly these confines exist within our systems and they are continualy being tested in the ways of signal (many of which are bad) - Noise is also where the leading information lies.

The second way to filter bad trades is to have an additional entry/exit rule after a signal is given to validate the move. I prefer "close only stops". Buy if close > high of the signal bar (I'm using intraday). I could do this in Tradestation, I have yet to acheive this in NSDTP. I am experimenting with the trading strategy information in the indicator wizard and setting up two systems, an initial and a validator. It is probably not too hard. I might need some help in this department for the good of the people. Close only stops filter out noise as markets typicaly run for stops. I actualy add a little room like a 1/4 above high , depending on the market

Thanks for listening

Thanks for the idea -- I came up with the following and placed it as my only rule for a long exit

SELL LONG CONDITIONS:
A<B(Close,Mul2(MaxValEntryAct(Trading Strategy #2,Close,1),0.995))

It's suppose to trigger a sell when the close falls 1/2 percent below the highest close after the buy was triggered. This is a stop that should be triggered on any pullback but It only works 90%. One time it let the stock run 24 hrs and drop 2 points, then the sell was triggered by a BAD print two points above market.

Is this a bug in the software or is there something wrong with the way this rule is being implemented?. This is the only rule I was using so there is nothing else interfering with it. It's just a basic tight trailing stop based on highest closing price.

thx, Steve

The rule looks ok, and we aren't aware of any bugs. You should submit your chart to tech support. Send the data too by exporting a text file so they can see the exact same thing you are seeing, and tell them where you see it on the chart please.

I deleted the data for that stock and let NSDT rebuild it and that seems to have solved the problem for now. Quote.com filters out bad ticks, but it's not an instantaneous process. Qcharts will correct the chart real time when a bad print gets filtered.

If you're building your charts real time during the day it might not be a bad idea to occasionally delete the underlying data so you can build a strategy on filtered data with no bad prints.

Hello tagster,

Why are you not happy with the following obvious solution you surely have tried: add supplemental predictions to the trading strategy, thus reducing the number of all signals, or, in order to be even more often out of the market, use logical OR on the exit signals , meaning, put. 1 or 2 out of 4 in the strategy wizard under exit signals if you have inserted 4 predictions.(the fourth prediction for example would not need to be used for entries).

Hi Albert,

Faster exits are a workable approach to exit sooner. However, sometimes it may knock you out of a good trade (not letting profits run). Multiple models or the panel of experts approach is interesting and I have experimented. Right now I am trying to combine two custom neurals or cluster with neural to make a more accurate system. I think that by asking for a validation above the high or below the low of a signal bar you are adding a market response dimension to the overall function. I feel that an arbitrary threshold of say zero should be permeable without allways signaling a trade. (letting the function flow freely). This helps aleviate the quest for perfection because it doesn't exist. Sometimes patterns look strong but the market thinks otherwise and a failed signal is important to notice and often means a counter move is imminent or the market is simply not ready.

Still having trouble with the GA. I have created an outstanding system for Ciena using the approach above and cannot, for the life of me, replicate it in other markets with succesfull walk forward results. Even matchnig all initial weightings and settings.

Tuscar Chande has an article in this month's Technical Analysis of Stocks & Commodities which talks about using standard deviation of the stock's price as a determinant towards exit prices. I like this method since a) the STDEV will vary as the stock volatility varies, b) the engineer in me likes a statistical method which adapts to different market conditions over the long term and c) you can explore your win/loss ratios at various exit points (2x stdev, 1.5x stdev, etc.) to find a comfortable drawdown. Take a look!

Hello Tagster,
You seem to like the artistic approach, will give soon detailed comments and try to figure out some of these contradictions I see in your dislikes towards voted exits for the mean time, try acceleration % on DJI av and add it as an input to your predictions...somewhere it might boost your CIEN to 1000% if the other inputs permit.
Tell us with what couple of other inputs it works at your end.

Thanks Albert,
I'll give it a try. I have noticed that I may not have been allowing optimization to run long enough. Stopping after ten minutes simply does not work when you are working with a recurrent. It takes time for all the weights to balance. And optimal walk forwards need time to work through as you sill see the % optimized drop backwards as optimization shifts to the next Optimal walk forward layer. I'll try acceleration and see where it goes.

Sometimes patterns look strong but the market thinks otherwise and a failed signal is important to notice and often means a counter move is imminent or the market is simply not ready.

Still having trouble with the GA. I have created an outstanding system for Ciena using the approach above and cannot, for the life of me, replicate it in other markets with succesfull walk forward results. Even matchnig all initial weightings and settings.

Hello tagster,

Why are you not happy with the following obvious solution you surely have tried: add supplemental predictions to the trading strategy, thus reducing the number of all signals, or, in order to be even more often out of the market, use logical OR on the exit signals , meaning, put. 1 or 2 out of 4 in the strategy wizard under exit signals if you have inserted 4 predictions.(the fourth prediction for example would not need to be used for entries).

There has been recent discussion about expanding the length of trades to that a system doesn't overtrade. Most of the ideas treat the symptom but might not effectively remedy the problem. Bad trades are part of life. I mentioned in another post to look for meaningful losers when developing a system. The fact that we are attempting to address complex non-linear environments with simple buy/sell threshold has limitations. Down the road we will need to address more complex forms of normalization (perhaps fractal related - any ideas, programmers?).

One way to minimize bad trades is to stay out of the markets more. The flat position is under utilized by most traders. There are simple periods where a market is going nowhere or is going crazy.

Again, probably fractal related, and again welcoming any ideas or input on this matter - hurste, CFB (jurick), Chandre CMO, Commodity Selection Index????
Any ideas? Success stories with these???

The allways in the market philosphy is a curious one. Although it is easy to think about, it is something of a linear approach. The SP500 is a common offender market for traders. Many have a personal vandeta with it. Unless you have consistent success, Steve Ward will tell us that we should look for markets to better suit our models.

Market exist in a multidimensional space. As energy (volotility) expands the geometric confines (boundaries) are tested and typicaly violated. These confines can be illustrated on our charts as trends, support, wedges etc. More importantly these confines exist within our systems and they are continualy being tested in the ways of signal (many of which are bad) - Noise is also where the leading information lies.

The second way to filter bad trades is to have an additional entry/exit rule after a signal is given to validate the move. I prefer "close only stops". Buy if close > high of the signal bar (I'm using intraday). I could do this in Tradestation, I have yet to acheive this in NSDTP. I am experimenting with the trading strategy information in the indicator wizard and setting up two systems, an initial and a validator. It is probably not too hard. I might need some help in this department for the good of the people. Close only stops filter out noise as markets typicaly run for stops. I actualy add a little room like a 1/4 above high , depending on the market

Thanks for listening

Re: Filtering Bad Tades

Date :7/3/2001 3:21:32 PM Poster : tagster

Albert,

Comment on using index information as an input to a model for a stock. I am not a big fan of intermarket analysis. I beleive the relationships are far more comlex or random than many financial engineers would like to admit. Further more, markets have become more fragmented over time. The old adage "It's a market of stock not a stock market" is a cliche but a relevent cliche. When you move away from a stock towards an index you are moving away from the more relevent or leading information to general and lagging. You could perhaps use the SOX index when trading Intel or Broadcom. This might be closer to underlying market forces surrounding an isuue.

Good Luck

Thanks Albert,
I'll give it a try. I have noticed that I may not have been allowing optimization to run long enough. Stopping after ten minutes simply does not work when you are working with a recurrent. It takes time for all the weights to balance. And optimal walk forwards need time to work through as you sill see the % optimized drop backwards as optimization shifts to the next Optimal walk forward layer. I'll try acceleration and see where it goes.

Hi Albert,

Faster exits are a workable approach to exit sooner. However, sometimes it may knock you out of a good trade (not letting profits run). Multiple models or the panel of experts approach is interesting and I have experimented. Right now I am trying to combine two custom neurals or cluster with neural to make a more accurate system. I think that by asking for a validation above the high or below the low of a signal bar you are adding a market response dimension to the overall function. I feel that an arbitrary threshold of say zero should be permeable without allways signaling a trade. (letting the function flow freely). This helps aleviate the quest for perfection because it doesn't exist. Sometimes patterns look strong but the market thinks otherwise and a failed signal is important to notice and often means a counter move is imminent or the market is simply not ready.

Multi Time-Frame Module

Date :5/15/2001 9:29:46 AM Poster : Daniel P Lyons

I believe a feature that would improve NSTP is a module that allows trading strategies to utilise multi time-frames and categories. For example, when trading the S&P (or currencies), it is not uncommon to have a hierarchy of signals from various time frames and categories such as 15 min, 5 min and 1 min charts with references also to the Nasdaq and Dow Jones as cross checks.

Developing a trading strategy using only one specific time interval and category appears to be arbitary and possibly limits the power of the technology in identifying risky trades and better trading opportunites.

Just some thoughts,

Daniel

Wish List

Date :5/16/2001 11:38:31 AM Poster : Steve K

I am watching an intraday trading strategy that backtests nicely.

In the Alert List it would be nice to have the Entry/Exit prices with a running total of profit/loss. That way you can tell at a glance how you're doing and compare actual entries with NSDT entries.

But other than that, it's working nicely. Probably start trading it

Steve

Re: Wish List

Did you look at the indicators in the Trading Strategy - System Info category. There should be something in there you can use for your equity curve and create an alert based on that.

Excessive Memory Usage

Date :5/18/2001 4:41:11 PM Poster : Steve K

At the end of the day NSDT came to a crawl and started lagging by as much as 6 min using 2 min bars -- qcharts was running fine so there weren't data problems on qfeed. I am a long time user of qcharts so I understand the past problems with this feed and how to resolve them. Everything on qcharts end was running fine so I looked at memory usage.

--NSDT was using 165 meg of memory and over 70%-95% of cpu processing.
--To clear up some memory I removed 2 stocks bringing the total monitored down to 9. No memory was released.
--After market close, I shut down the chart window and kept NSDT running, NSDT was STILL using over 100 meg while it's not doing anything.
--I closed NSDT and restarted it, NSDT was using only 17 meg at startup
--Reload the chart and NSDT is using 97 meg.

Why is NSDT using so much memory (165meg) and not freeing it up when charts are closed and symbols deleted?

I had one severe memory leak a few days ago where memory usage soared to over one gig in a matter of seconds and brought the computer to a crawl till I could manage to shut down NSDT. I don't know if the 2 issues are related but I am more concerned about the 1st problem which seems performance related vs the 2nd which so far only happened once.

Everything else is running fine and I've been getting some nice tradeble signals

Any thoughts on the memory issue?

thx,
Steve

Re: Excessive Memory Usage

Date :5/18/2001 5:29:17 PM Poster : Ward.net Webmaster

Qcharts could certainly have been using a different server than NeuroShell, but if not, any type of memory thrashing lockup needs to examined by our tech support experts. Please send your chart so they can see what is in it and try to reproduce the problem.

In general, there are several things that users can do to avoid using a lot of memory to begin with. Lots of walk forwards in neural nets use lots of memory, as does loading and displaying too many bars, all compounded by multiple chart pages. Displaying too much data is much worse than loading too much. Lots of things hidden on the chart add up too - get rid of indicators, nets, and strategies you are no longer using. NeuroShell has no limits on what it will let you try to do.

Re: Excessive Memory Usage

Date :5/18/2001 6:32:37 PM Poster : Steve K

It's a proprietary chart so I'll try to explain:
It has:
-- 1 trading strategy with a few rules, no nets or add-ons.
-- 4 charted indicators
-- buy/sell indicators
-- 1 hidden indicator
-- 1 unused Prediction that i am developing, 5 walk forwards
-- 1 hidden unused trading strategy with a do nothing rule -- used for setup so I can copy it & not have to reenter my defaults to a new strategy

NSDT can't copy/paste rules and strategies between charts so, although I don't have much in it it has been thru a lot of iterations and development and backup copies.
Do these charts continue to grow in complexity internally even tho unused indicators/predictions/strategies are deleted vs manually rekeying everything into a fresh chart?

There's also the issue of NSDT not freeing memory when a chart is closed and nothing loaded.

thx again

Your problem is going to have to be taken up by tech support; please contact them to see how the problem can be tackled. We'll ask our programmers to check if there's any issue of memory not being released in general when charts are closed.

In answer to the general questions, if strategies and nets are deleted, their memory is supposed to be released, so all unused items should be deleted, even if hidden. Although you cannot copy and past a strategy to another existing chart, you can do these things:

1. Save the chart as a template in the Template folder, so that strategies, indicators, etc, can be reused again and again.
2. Save indicators as custom indicators so they can be pasted into other charts and other chart strategies.
3. If you think a rule might be used again, save it first as a custom indicator, because rules are really just indicators. Then it can be used in aother chart strategies.

I too have experienced similar problems. I once loaded a chart with 2 indicators which had a max. of 4 variables per indicator. I did not utilise any nets and was attempting to optimise the variables etc. After 12 hours I cancelled the program. Total memory consumption was unbelievable so I also suspect there maybe a memory release issue somewhere. Oddly enough I do not recall the same problem in the former version,

Daniel

Here is what I have found. The acctual memory usage does get up to 150meg but it holds there. I have a 1gig CPU and 256meg ram. I have never ran out of memory but my CPU is slammed to 100% normal operation and it never comes down. I am looking at a Dual processer setup with 1gig ram to try and level things off to at least 50% normal operation levels.

Why is NSDT using so much memory (165meg) and not freeing it up when charts are closed and symbols deleted?

I had one severe memory leak a few days ago where memory usage soared to over one gig in a matter of seconds and brought the computer to a crawl till I could manage to shut down NSDT. I don't know if the 2 issues are related but I am more concerned about the 1st problem which seems performance related vs the 2nd which so far only happened once.

Everything else is running fine and I've been getting some nice tradeble signals

Any thoughts on the memory issue?

thx,
Steve

Hi all,

You all may want to try this tool for recovering lost memory due to ill-behaved applications, memory leaks or memory fragmentation. It's called MemTurbo. You can download it at www.memturbo.com. Quite a piece of good software. I used it on my customer's web server to monitor and rectify excessive memory usage, automatically. Hope this helps.

Our technical support dept. reports that to date nobody complaining of excessive memory usage or failure to release memory has actually sent in a chart so we can reproduce such a problem. We aren't doubting that it happens, but it probably happens only in certain cases. We also need to verify it isn't just taking a while to release memory. For excessive memory, we need to make sure there isn't just a lot of things in the chart, or maybe years of 1 minute bars. In any case, we'd really appreciate actually having something to work on here.

Re: Excessive Memory Usage

Date :8/13/2001 6:12:31 AM Poster : albertl

Hello Steve,
try this:
REDUCE THE FOLDERS AND STOCKS the trader IS MAPPING or exit the trader each time in the task manager. I am running the simple trader on windows 98 + AMD 188meg. Originally my Trader was mapping all tickers and folders of the CD-ROM . (default setting) The trader was always staying in my memory after exiting the program normally!

Just for fun I managed to have the trader up to 5 (five) times in the task manager. This in 188meg, without loading any chart though. I do not know why the mapping of the folders containing the data is done so extensively at each start of the trader, it takes an eternity and blocks the memory as far as I can see , even if one charts only one stock. Since I have reduced the mapped folders to a minimum (I do not use the CD presently) only 20 stocks but plenty of indices, my trader exits are absolutely clean and the start up is fast.
Hope I was of some help.
albert

The Lead(X,n), Predict3 and Prediction Net

Date :5/24/2001 4:46:49 AM Poster : Jacobs

I´m playing around with an ANI indicator and the Lead indicator.....

I made a net (Prediction Wizard) trying to predict the %Change(C,1) 1 day into the future.
As input Predict3 (ANI indicator) was used with the following settings:
Lookaback = 30
Lookahead = 0
Actual = Divide(Sub(Lead(C,5),Close),Close)
Input #1 : %R(H,L,C,9)
#2: StochasticSlow%D(H,L,C,2,7,2)
#3: RSI(C,9)
Contribution factors: 15.2, 11.1, 8.8
Trainingset: 3years with 1 wfd of 1 year. Objective: Maxinize Return on Account, Long position only.

The result (too good) indicates I´m feeding the answer back into my Prediction net, but I don´t understand why, where and how.

I thought the Prediction net used, as input, the prediction/estimation of the Actual (made by Predict3) not the Actual value itself.
In the walkforward period there shouldn´t exist any values of the Lead(Close,5)? , they exist only in the Training period or ?

I get exactly the same result if I use Divide(Sub(Lead(C,5),Close),Close) as input instead of Predict3?

As soon as I set "days into the future">number of days in the Lead indicator I get more normal results.

I don´t see where the answer (correct value of the Actual) is fed into the Prediction net.

Re: The Lead(X,n), Predict3 and Prediction Net

Date :5/24/2001 9:04:35 AM Poster : Ann

Maybe this note from the Adaptive Net help file explains it:

If you set the lookahead period to zero, then the Net predictions are no longer out of sample, because the Net sees the output in the same bar it sees the inputs. It is essentially just memorizing. If you set lookahead to zero and set the contributions high enough, the Prediction Nets can exactly reproduce the outputs. The Classifier Nets will get the probabilities 100% correct.

Betting Strategies

Date :5/24/2001 10:35:12 PM Poster : Cantley

Would anyone care to discuss betting strategies that work with neural network systems? I've been struggling with the idea a little bit. I've yet to find a stop that really makes sense for a trading strategy, and without a stop, it's hard to know what your real risk is on a trade. And not knowing what your risk is makes it difficult to decide how large a position to take on.

What has worked for others?

Best,
Steve

Re: Betting Strategies

Date :7/30/2001 12:31:27 PM Poster : ANNATS

I just flush all my signals through Tradestation and then evaluate it in Portfolio Evaluator 2000. as far as implementing different strategies you can then export the files into Money Manager 2000. good books along these lines are Maximum Adverse Excursion by John Sweeny, and all of the Ralph Vince books.

Global server , realtime feed access

Date :5/26/2001 7:42:24 PM Poster : Mark

Has anyone been attempting to access their live data feed via tradestations
global server lately ? It uses esignal and pcquote.com (is hyperfeed.com)
I wanted to use it as a back up data feed to the quote.com service . I´m wondering if there´s any error messages with the global server since release 3.21 of the trader and I don´t want to dish out a months data fee to esignal just to see whether the global server is still playing up , I´d rather be warned before paying .
Mark .

getchromosome errors

Date :5/29/2001 7:33:17 AM Poster : Steve K

I've been getting "getchromosome errors" while optimizing trading strategies. It usually happens when developing a strategy and stopping then restarting optimmization after several times. If the error is triggered at the beginning of a long optimization, I have to cycle thru thousands of these errors before I can exit the trading strategy, or close the program with the task manager. Closing the chart and reopening it will not fix this error. The whole NSDT program must be closed then restarted.

Anyone else get this error?

Steve

Re: getchromosome errors

Date :6/3/2001 11:45:37 AM Poster : Ward.net Webmaster

We'd really appreciate it if you'd send the chart that gets these errors to support@wardsystems.com so we can see what the cause is.

the error seems to be pretty random. But this is what I know.
-- It only happens when optimizing a trading strategy and after several optimization cycles, sometimes after hitting the stop optimization button

I'll see if I can duplicate it in a chart and send it to you

Parabolic SAR

Date :5/29/2001 7:39:27 AM Poster : Steve K

A few trading programs have a fairly complicated indicator called Parabolic SAR(Stop & Reverse), but I can't find it in NSDT.

Does NSDT have anything comparable or is it possible to create this indicator?

Here's a url that has the formula http://www.tradertalk.com/tutorial/para.html

thx, Steve

Re: Parabolic SAR

Date :5/31/2001 4:06:46 PM Poster : Steve K

-- I wrote a dll for Parabolic SAR -- still need to add optimization variables for AF, AF min & AF max -- as it stands now it uses the recommended defaults of .02, .2 & .3 and works pretty good as an indicator. Haven't had a chance to work it into a strategy yet.

thinking about posting it to the thread if anyone is interested

Steve

Re: Parabolic SAR

Date :6/3/2001 2:47:04 PM Poster : Steve K

I am just about done. I added another feature:
Since the formula uses hi/lo data for each period I added an adjustable filter to remove bad prints. If the HI or Lo is a percentage above or below the close then the Hi/Lo is adjusted to the closing price +/- the percent filter.
Most of the stocks I watch have a bunch of bad intraday prints. I've concluded the mms do this intentionally to screw up charting software and generate false signals. The filter's probably not needed on daily charts so it can be set to zero and turned off.
If I turn the filter off and look at a daily chart with bad prints I can see the big difference it makes.

I'll post it in a few days, after I finish checking it out

Steve

Re: DataX

Date :5/31/2001 8:45:29 PM Poster : Steve Kratochvil

The app I am working on (AutoPilot) calls up the DataX ocx to get signals from the NSDTP, it then turns around and sends orders to DATEK when the DataX gives the signal. I am also using JavaScript to read the content of DATEK and feed it back into the AutoPilot to update position information. The rest is being defined as we speak. I am building in all the features that I want to have for trading. I am even thinking about adding a MS Agent to give it a bit of personality.

I wish that it was more complicated than that, but simple is also faster.

OK, here is the deal. I have spoken to Ward Systems and we talked about the product I have created. After some very mixed feelings on my part I have this to say. I built this for myself and the idea of passing it on to someone else came with a great many legal issues that I could never handle. I also learned that Ward Systems has something like what I have waiting in the wings as they tackle the legal issues surrounding delivery of such an application to the market. Now with that being said. I will not object to helping others reach the same goal with their DataX control. It seems to me that automated trading was what the DataX was built for.

Steve

If I can help you out Steve. I will.

For anyone still interested in my little rant about DataX. I have a working Model:

NSDTP to DataX to AutoPilot to DATEK

I expect to be finished by July 15th. I got some help from a great guy that has been messing with DATEK for some time. The end result is that I have an automated system that can daytrade while I am away.

Steve

Note: It is my intention that all trades my system executes are my choice even if they are profitable or not.

Vince,
Are you planning on selling this add on to Neuroshell or sharing on the Web? I would think if you are sharing it and provide uncompiled source that would avoid legal issues. Would you share it if I was to write a module for it?

At this time yes. Over the years DATEK has had a reputation for changeing their web interface quite offten. I decided to head that off at the pass and built my AutoPilot using the Script Control and JavaScript to talk to the different parts of the web site. The result of this is that I can change the script anytime DATEK changes and my program will never know the difference. This could also be used to talk to other broker sites to get position data or send the orders that come from DataX.

RE: Automated Trading, ATTN. Steve Ward

Date :12/3/2001 1:28:08 PM Poster : Alex S.

Mr. Ward, regarding Steve Kratochvil's comment below: what's the status of NS "Automated Trading" platform?

I have a job outside of trading, so I am unable to monitor my positions/markets at all times, so I have been desparately looking for something to automate execution of my strategies with no success. I am currently using Tradestation that offers some "pseudo-automation", but all trades still require confirmations, which means, you still have to be readily available.

This made me start learning C++, so that I could attempt to potentially write an interface to a broker (in my understanding, very few brokers publish APIs to interface with their feeds, etc.) It would certainly be grand if Ward was in fact coming out with something of that sort, if I understand correctly the statement below. Thanks.

Re: RE: Automated Trading, ATTN. Steve Ward

Date :12/4/2001 2:05:47 PM Poster : Steve Ward

Building an automated trading addon is not difficult from a technical standpoint. However, we fully understand why trade confirmations are required with TradeStation. The legal issues we are struggling with are no doubt the same. As most of our sophisticated users know, no model is perfect, and markets change. So I can't imagine someone turning on a trading model and then going away for two weeks, but some people would do that. We don't want to be on the blame line if they come back and find out their system cleaned out their bank account for whatever reason.

Custom Indicators

Date :6/4/2001 11:57:26 AM Poster : Chris Goodwin

I'm experiencing some problems with custom indicators. I can create custom indicators, and use them in a few models without a problem. Sometimes when I attempt to add a custom indicator to a trading strategy, the screen that should display the custom indicator data is blank. When I click finish to add the indicator to the strategy, I get run-time error 5. Is anyone else having similar problems?

Re: Custom Indicators

Date :6/4/2001 12:58:26 PM Poster : Ward.net Webmaster

There were problems with release 3.2 in this area, which is why we made 3.21. Check if you are on release 3.2. If so, download the simple fix on this site (release news). If not, please send instructions on how to recreate the runtime 5 to support@wardsystems.com.

To use your custom indicators, you first have to define what type of strategy to employ i.e (Crossover, Breakout, etc.), then you will be able to use your cutom indicators in the strategy otherwise, you custom indicators will not be listed since you haven't defined your trading strategy.

Here they are -- Parabolic SAR, DMI(+), DMI(-)

Date :6/11/2001 1:40:58 PM Poster : Steve K

I finally finished the Parabolic SAR dll and over the weekend and added DMI(+) & DMI(-) as custom indicators.

FOR the SAR I used the formula & rules from http://www.tradertalk.com/tutorial/para.html -- I also added a couple things
FOR DMI(+) and DMI(-) I parsed the formula for DMI as provided in the NSDT indicator help file

Parabolic SAR needs to be converted to a dotted line in NSDT then overlayed in a bar chart

Summary of Parabolic SAR Parameters:
High, Low and Close -- the SAR is calculated from the High & Low and a reversal is triggered when the Close value crosses the SAR

This formula doesn't need a lot of optimization so to speed things up, for the AF values I used integers and converted to decimals in the dll by dividing by 100

AF Increment --- default 2, optimization range 1-10, internal dll range .01 - .10
AF Min --- default 2, optimization range 1-10, internal dll range .01 - .10
AF Max --- default 20, optimization range 20-40, internal dll range .20 - .40
Hi/Lo Filter % --- default = 2%,0 = off, This paramter filters bad prints by limiting the HiLo values to a % of the close value. I normally use 2 min bars. You might want to raise this value for longer periods and turn it off entirely for daily, weekly & monthly bars
ROA --- Rules of Advancement, default = 1, optimization range = 0-2
0 = off
1 = SAR will not advance into the filtered Hi/Lo range of the previous bar
2 = SAR will not advance into the filtered Hi/Lo range of the previous 2 bars

DMI(+), DMI(-) parameters:

the DMI formula uses a bunch of Exp Avg Periods which I mapped together -- default value 10
I couldn't hide the other paramters so just ignore them

you can put each DMI() into a moving average(or use them as is) and get some interesting buy/sell signals at the crossovers

Good Luck & enjoy

Steve

You can download Steve's ZIP file containing three (3) tpl files and one (1) DLL file using this link: http://www.ward.net/downloads/parasar.zip. Once you have downloaded the file, unzip all files to your :\NeuroShell Trader\Template directory. If you have any questions about these indicators, please direct them to Steve on the forum. Special thanks to Steve to providing these files.

Re: Here they are -- Parabolic SAR, DMI(+), DMI(-)

Date :7/22/2001 5:12:54 PM Poster : Andrew

Hi Steve,

Ive downloaded your files - Thanks ! However when I try to use the DMI(+),DMI(-) I receive an error message saying it cant find the following file: customInd.dll ?

I have all four files. The dll file however is called parasar.dll

Are these indicators only ment to be used with NSDT ?

Thanks for your help.

Andrew

Tough going with GA

Date :6/11/2001 9:25:55 PM Poster : Chris Niemann

I am having extreme difficulty enabling the optimizer to work in my favor.

Everything I am doing seems to make sense and I can create greate looking neural and clustering indicators without any optimization.

When I try to build a prediction of optimal change in close for (160) 5 minute bars (actual looks like a healthy fitness target) using CCI's or MACD's of different values to essential express non- correlating fractal forces fed into a sparse net and a cluster. Optimizing return on account with 6 months of data smallest set (2 weeks) with 5 optimal and 5 regular walk forwards (2 weekks) with 6 neurons adjuxting for trending markets

The optimizer allways seems to get completely lost and I am better off without optimization.

Another thing I will try to do is groom a single neural indicator by predicting optimal change in close 160 5 min bars with Zero neurons hoping to improve over the default values. Still lost and need some guidance. Perhaps I am trying to make things overly complex but my desire is to use a few intelligent indicators with a few hiddens versus piling on basic indicators and neruons

I know I am close and hope there is probably something small that I'm missing.

I know th inputs are great the data is good and the fitness and set sizes appear to be reasonable.

Any guidance or tips, I have read most of the info online and in the help files.

Thanks,
Tagster

I don't know what you mean that the optimizer gets "completely lost" but it was always my impression, and it seems to be the case, that if you build a strategy and THEN optimize it, that the optimizer starts with the existing solution in its "pool" of solutions. I'm not sure I'm using the correct terminology here, and I could never begin to even understand what you are doing, but it appears that the optimizer should not get worse than what you already have, not on the part being optimized anyhow. Maybe you are seeing your out of sample results "get lost" as you optimize better and better? If so, that's a whole 'nother kettle of fish.

Re: Tough going with GA

Date :6/12/2001 3:11:50 PM Poster : Tagster

Let me clarify. The optimal percent change in close for 160 five minute bars looks and seems like a reasonable fitness. Maybe this is the problem.

I am adjusting for trending markets using multiple two week walk forwards (5-6)

By getting lost I mean that by itself a neural indicator looks reasonable. If optimizing and it finds two or three periods where wild numbers bump up the end result then those wild numbers are its idea of the best numbers that will test forward well and generalize only they have little to do with the future.

Maximize return on account is the goal. I am unsure what else to try. Maximize return on trades has typicaly produced unusual responses but I will experiment further. Perhaps I'm being overly idealistic but I would hope the optimizer

The inputs I use might be overly complex Clusters, wards or recurents that seem track market buy and sell points and classification of bullish or bearish quite well out of the box (no optimization.

I usualy use only one or two inputs into a prediction or strategy with under 8 neurons. This seems reasonalbe to me to reduce overfiiting and strive for powerfull inputs to begin with without over reliance on the GA or the hiddens. Perhaps I'm in the woods here.

Each night I pray and try to persist.

feel informed, and yet clueless

Re: Tough going with GA

Date :6/12/2001 4:29:17 PM Poster : Chris Niemann

Quick comment.
I had been using 6 months of 5 min Basr as a max and 2 weeks as a minimum. The two weeks may be simply too small to model and the GA will optimize for an isolated environment. Now trying 2 months as a minimum looking better. This may have been the culprit.

Also I use 5-10 2 week optimal walk forwards with 4-6 walk forwards. Not sure if this is an issue but seems reasonable.

Welcoming any suggestions

Ok, so the optimizer is not finding things that work into the future. I am also assuming by "wild" you mean the optimizer latches onto some really good situations in the optimal walkforwards that probably don't occur later very often. I see this sometimes too - there'll be a big jump during optimal and the optimizer learns it can make more money just buying before the big jump, regardless of what else it does. (Forgive me for trying to be so logical - I'm an ex-programmer!).

I'm also going to assume your nets aren't too complex, because I'll never understand your clustering and fractal forces. So my idea is to stop using the optimal change in close, because during the beta I noticed Ward had that as a default but then it wasn't by the time the release came out. Must have been some reason they did that! Plus, it isn't clear how far ahead you're letting this optimal change in close go, but it sounds like 160 bars ahead you're predicting. I'm not sure so far ahead is good, but I have to emphasize, I'm no expert either!

Re: Tough going with GA

Date :6/26/2001 4:43:02 PM Poster : Tagster

Thanks TB XP,

Beleive me, I am no advanced TA snob. I do however beleive in looking deeper by accessing longer term information along with the shorter term.

I use the term fractal in a loose sense. To me fractal means pattern within a pattern. Steve ward had created succesfull models simply using 5 RSI's with different values. I would call that a fractal approach (again loosly). Dr. Elder in "Trading for a Living" uses MACD's of different values (I beleive he multiplies by a factor of 5. A moving average crossover system is referencing two different time periods within a time series. This method used to be effective in the eighties and prior when markets where more structured. Murray ruggiero has demonstrated in his book that this method has since become challenged by current markets. Implying that a deeper approach is required.

I am a firm beleiver in simplicity to start with, address market complexity or chaos and return to simplicty (buy, sell, bullish, bearish etc). my method is similar to the above along with adding a some price regression (slope) readings fed into a neural or a cluster. Using < 10 neurons and 2-3 inputs. The neurals and clusters look good prior to optimization and seem to get fouled up durring optimization. Meaning that the GA will give a 250% + retun and the walk forwards are abysmal.

The difficulty I am experiencing lies in either what I am trying to predict or the default fitness of maxinmize return on trades. Predicting optimal % chang in close.
I have also tried JMA smoothed 30 period momentum (all on 5 min charts)
6 month max and 1 month min with 5 WF's and %owf's of two weeks seems reasonabl?

I have created an exceptional model for Ciena and cannot seem to replicate it in other markets. Very frustrated as I keep running into a wall. Feeling rather foolish in that I know this software is powerful and I know my ideas are strong but they ends don't seem to want to meet. Maybe it's off to AI Summer school.

Any pointers on fitness and what to predict.

Limiting time-of-day in charts

Date :6/13/2001 11:48:13 AM Poster : Jimmy Raineri

Is there any way to "filter" time-of-day so that bars are only created for user defined time ranges?

Also, is it possible to set up the trader so it can see pre- and post- market activity?

Re: Limiting time-of-day in charts

Date :6/13/2001 4:30:52 PM Poster : Texas Bubba

Why do you want to create bars only within certain time ranges? Maybe there's another way to skin the cat.

Re: Limiting time-of-day in charts

Date :6/13/2001 5:27:45 PM Poster : Jimmy Raineri

Let's say I only want to trade between 9:30am and 11:30am.

I know I could control this in a trading strategy - but thats not really the issue.

I don't want my indicators "seeing" or "using" data from outside the time period. For example, if I have a 10 period moving average, I don't want the 9:45am value of that indicator to include the previous days 2pm - 4pm values as part of the 10 periods - I want it to only use the values within my 9:30 - 11:30 period. As if those 2 hours were an entire trading day.

If you are trying to come up with a trading strategy to play only the open and a couple of hours after that, you may want your indicators to only see the previous days last 2 hours of trading, etc., etc.

Also, you may want to use post and pre market activity in an indicator to feed into a trading strategy - that's why I'm asking about the trader seeing that data - quote.com is sending it - but I can't figure out how to display/use it in the trader.

Yes, I know about that feature - but that doesn't help.

Let me simplify - "pretend" that a trading day is 2 hours long - 9:30am until 11:30am. I want my indicators to calculate using only those values - even across days.

For example, let's say I have a 15 minute chart. At 9:30am on Tuesday an LAG(CLOSE,2) indicator would return the 11:15am monday close - not the 3:45pm monday close.

Does that make it clearer? Thanks.

This is probably a great reason for taking the new courses.

In fact what you propose is well catered for.

When using intra-day data the Time Flags indicator category is selectable.
If for example you choose, (i) "X<=Time<=Y" and select 09:30 and 11:30 as the variables, the trading strategy will only trade between these times.

(ii) I use 09:00 to 16:00 on the opening long and then use the time flag "Time > = X" on the long exit with a parameter of 16:15

To explain the significance (i) will only enter a long strategy between the two time quoted and (ii) will always close a trade at 16:15 depending on the time frame selected i.e. if you choose a time slot, say 30 mins or 20 min then the time may vary to the debit side of 16:15.

Ergo.

On 6/14/01 11:55:04 AM Jimmy Raineri wrote:

Ergo -

Unless I misunderstand, what you propose is not a solution.

Notice you say "will only trade between these times". I knew I could do that all along. However, that doesn't stop the trader from using time periods outside that range in the calculation of indicators. For example, a moving average covering 10 periods will include values from outside that time range. The time range is only used when deciding to trade or not - it doesn't have any affect on the data used to calculate the indicators.

If for example you choose, (i) "X<=Time<=Y" and select 09:30 and 11:30 as the variables, the trading strategy will only trade between these times.

(ii) I use 09:00 to 16:00 on the opening long and then use the time flag "Time > = X" on the long exit with a parameter of 16:15

To explain the significance (i) will only enter a long strategy between the two time quoted and (ii) will always close a trade at 16:15 depending on the time frame selected i.e. if you choose a time slot, say 30 mins or 20 min then the time may vary to the debit side of 16:15.

Ergo.

On 6/14/01 11:55:04 AM Jimmy Raineri wrote:
Yes, I know about that feature - but that doesn't help.

Let me simplify - "pretend" that a trading day is 2 hours long - 9:30am until 11:30am. I want my indicators to calculate using only those values - even across days.

For example, let's say I have a 15 minute chart. At 9:30am on Tuesday an LAG(CLOSE,2) indicator would return the 11:15am monday close - not the 3:45pm monday close.

Does that make it clearer? Thanks.

I know I could control this in a trading strategy - but thats not really the issue.

I don't want my indicators "seeing" or "using" data from outside the time period. For example, if I have a 10 period moving average, I don't want the 9:45am value of that indicator to include the previous days 2pm - 4pm values as part of the 10 periods - I want it to only use the values within my 9:30 - 11:30 period. As if those 2 hours were an entire trading day.

If you are trying to come up with a trading strategy to play only the open and a couple of hours after that, you may want your indicators to only see the previous days last 2 hours of trading, etc., etc.

Also, you may want to use post and pre market activity in an indicator to feed into a trading strategy - that's why I'm asking about the trader seeing that data - quote.com is sending it - but I can't figure out how to display/use it in the trader.

The Trader isn't really made to do what we understand you want to do without building your own indicators in a DLL, maybe. However, we have a largely undocumented feature that might help, where an asterisk means "no data". It is like the asterisk you pass back and forth to DLLs. We didn't

document it because there are some real hard to explain situations that you can get into when you use it. We aren't even sure ourselves of all the problems you could have. But if you want to experiment with it, understanding that technical support isn't able to assist you with the problems you might have with it, here goes:

You can use an asterisk in an If/Then/Else rule to make something like a simple moving average go back to the previous time period in the calculation. For example, the following moving average should only use the close values between 9:30am and 11:30am when it's calculating:

SimpleMovingAverage (IfThenElse(X<=Time<=Y(9:30am,Date,11:30am) , Close, *), 100)

Yes, you understand exactly what I'm talking about. Very interesting idea to use the if/then/else as input to an indicator. That opens the door to some interesting things.

Is there some way to get the trader to see before 9:30 and after 4:00?

Thanks!

Trader Beta 3.26

Date :6/13/2001 3:02:45 PM Poster : Ward.net Webmaster

For a few days now we have had a beta release available on this site. Our programmers are saying that no credible bugs have been reported on this release. Certainly it is better than 3.21, with lots of bugs fixed. However, we'd like to urge each of you to download it and try it on your trading systems. If it's going to have a problem with something you are doing, wouldn't you like us to fix it now while we can act quickly on it before it is released? This beta can be installed without removing your production release 3.21. If our programmers don't find anything wrong with it by Monday they may make it final!

Re: Trader Beta 3.26

Date :6/13/2001 5:30:25 PM Poster : Jimmy Raineri

I realize it says this on the beta website - but it can't hurt to stress it again - the charts that are saved from 3.26 ARE NOT DOWNWARD COMPATIBLE with other versions of the trader. So if you open an existing chart with 3.26 and save it over the top of itself, you wont be able to read it in your non-beta version of the trader.

Re: Trader Beta 3.26

Date :6/13/2001 11:11:31 PM Poster : Chris Goodwin

I just downloaded the beta, and am extremely impressed with the stability and performance. I routinely create charts with 100 stocks in them for screening purposes. I just discovered that with 3.26, removing stocks from the chart seems to execute much more quickly, as does closing large charts. It used to take several minutes to remove stocks from a large chart, and now it takes just a few seconds.

Please congratulate your developers on a job well done!

Chris Goodwin

type of data for prediction

Date :6/26/2001 3:33:35 AM Poster : claude cherel

Just thinking about the kind of datas to input to a prediction.

Let's say, If I would predict the sales of beverage, I would probably look at the weather, the day of the week, the season, the day of salary, everything which could have an impact on the sales... But I will not use the past sales as input.

Don't you think it should be the same for a stock? In order to predict the near future of a stock I could use S&P, NSDQ, Tick, TRIN, DJI, whatever I think it could be in relation with my stock. But the past values of the stock will only be the output data of the Neural Network, I will not use these data as input. A lot of indicators (rsi, stoch, macd, moving averages, etc...) are just another way to present the past values of a stock, so I should not use the stoch indicators as input to my neural network. If I want indicators as input then I should use S&P Stoch, Tick Moving average, DJI macd, etc. but nothing coming from the stock I want to predict.

Do you have any comment? Am I in the right way?

Thanks a lot in advance for sharing what you know.
Claude

Re: type of data for prediction

Claude:

I, for one, agree that for sales prediction, you would never use past sales as inputs, since past sales have little if anything to do with new sales. The other factors you mentioned will be far more predictive.

I think in theory, the same should be true of stock market predictions. The big question is - do the S&P, NASDAQ, etc. actually affect the stock price in advance? I don't know the answer. Certainly, interest rates in various countries affect exchange rates and bond prices. Probably oil prices affect the stock price of oil companies. Maybe the price of DELL affects the price of Gateway or Compaq. Weather certainly affects commodity prices. What about insider trading? I believe rather strongly that buy recommendations of brokers are a self-fulfilling prophecy for reasons that aren't hard to imagine. Therefore, sentiment indicators should be pretty good too.

On the other hand, the reason old prices might affect coming prices is because of greed and fear. If the price is low, greed may kick the price up. When the price climbs too high, fear drops it back. Therefore, you can argue that for stock prices, past prices DO affect future prices.

This is certainly a topic worthy of more contribution and ideas from other users.

Thank you very much Steve for your interesting answer.

Now time is coming to find out the correct indicators.

Where could I find an exhaustive list of sentiment indicators? I know a few but certainly not all of them.

Claude

P.S. Even if S&P, Nsdq, DJI are not always predictive, I sometimes get good results.

Oops. I realized that I didn't pull the conclusion on the timing of indicators back to your question. Not enough caffiene this morning.

We know that Mr. Greenspan has a tremendous affect on the market. How often does the Fed change interest rates? If you try to predict daily stock price change and relate it to interest rates which may change monthly or quarterly, then you're essentially limiting your stock prediction to "old" data or even worse... trying to train a neural net with data which seems to have high importance but only affects the stock price _when_ the interest rates change.

You could try to build an indicator which counts days until the next Fed decision, and guess at the change... But now you're getting into a lot of data massaging for an indicator which only pops up every few months.

Re: type of data for prediction

Date :7/1/2001 4:02:03 PM Poster : Allan Orn

Reading the works of old masters like R.D. Wyckoff, Edwards & Magee you will see a lot of discussion along the lines of "waves of greed/fear", together with "trade with the trend". I think that these concepts are still very useful.

When developing a neural (or other system) is a good idea to get the concepts in place before blindly picking some of the many available indicators.

Technical indicators tend to make certain price action stand out, i.e. oscillators signal price action away from a short term balance point while moving averages signal possible trend starts.

Depending on the trading concept chosen, it is best to add indicators that "amplifies" the tactical information that your system needs.

Regarding the possibility to predict future prices based on past prices: The academic community says it is not possible, most traders say it is possible but loose money, a few traders are able to do it but keep the methods to themselves.

/al

Nasdaq predictions as input to stocks

Date :6/30/2001 7:37:29 PM Poster : albert stoffel

Nasdaq predictions as input to stocks
Does anyone know how to trick the Neuroshell Trader into predicting index/futures and then using these predictions as inputs to a stock model, without having to export the index predictions into a file and reimporting them into the stock model? Thx albert

Re: Nasdaq predictions as input to stocks

Date :7/2/2001 8:53:41 AM Poster : Maxwell Craven

I don't understand, Albert. Predictions are right there in NST so you can stick them into any place you want without exporting anything. I do it all the time. Just put the out of sample net into a rule or indicator or whatever. If you have adaptive turboprop you can stick that in anyplace too. If I'm not understanding exactly what you are doing, please explain further.

Hello Maxwell,
special thanks, your answer makes me look forward to a brighter future with neuroshell..

The following were my question to support and the answer by support:>
(I am using the simple trader),

Q: how do I predict the NAS in a chart for CIEN for ex., then use this prediction as an input for Cien strategy or prediction?

A: You could not predict NAS in a CIEN chart. The only way would be to create another chart for NAS, export the results to an ASCII file and then use the values in the ASCII file as inputs to your CIEN strategy or prediction.

Albert - well, I guess Ward Systems is right, since I didn't pick up on the fact that you were predicting something for which the chart wasn't built. HOWEVER, they are only right with respect to the Prediction Wizard. You can do it with the adaptive turboprop2 addon; I just tried it! The prediction wizard makes an assumption about the issue being predicted, but AT2 makes no such assumption! It is much more flexible I'd say. Does that make me smarter than Ward Systems???

Re: Nasdaq predictions as input to stocks

Date :7/3/2001 6:11:36 PM Poster : Ward.net Webmaster

After reviewing this further, we have determined that it is possible to do this in the Prediction Wizard. You build the chart for the stock. Then insert the index as "Other instrument data." Then when you go to predict the index, you have to select "Other data/Indicators". There you will get a chance to select the Close for the index. You will probably want to make sure the inputs you use are based on the index as well. Therefore, the index prediction winds up in the chart, and you can then use the out-of-sample net, just as Maxwell originally said. No need to export or import, since you keep everything in one chart. But there are a few things to keep in mind:

1. The Prediction Wizard Training Results screen will indicate the ticker symbol of the issue with which the chart was originally built.

2. If you train on profit, all trades will be based on the issue with which the chart was originally built.

Does anyone know how to trick the Neuroshell Trader into predicting index/futures and then using these predictions as inputs to a stock model, without having to export the index predictions into a file and reimporting them into the stock model? Thx albert

Re: Nasdaq predictions as input to stocks

Date :8/11/2001 6:32:40 PM Poster : Steve Safigan

I know this reply is late, but if you're still monitoring this group for an answer, I might have one. I've just gotten started with NST myself, but this seems to work:

Add a stock as the primary chart, then add a subchart as the index. Write a prediction for the stock, but only use indicators for the index. For instance, instead of using %change(close,1), use %change(close of nasdaq index,1). Do this with all of the indicators in the prediction. Although NST will call this a prediction for your stock, it will actually be a prediction for the index, since all of the inputs relate to the index, not the stock. Now you can use the prediction you built as input into a trading strategy for the stock.

Category Inputs

Date :7/3/2001 12:05:35 PM Poster : DickDanger

I would appreciate any help available with the following.

I have been trying to determine the best way to input the day of the week to my neural net. I have tried using a singe input (1=Monday, 2=Tuesday...5=Friday) and I have tried using 5 binary inputs (1,0,0,0,0=Monday, 0,1,0,0,0=Tuesday...).
Using a single input works poorly, which is probably expected. However, using 5 binary inputs, although better, is not all that good either. I created a simple artificial data set, where the output should be able to be predicted perfectly if the day of the week is known. Even using 5 binary inputs, results were mediocre. Anyone know why, or any other ways to tell a NN the day of the week?

Thanks,
Dick Danger

Re: Category Inputs

Date :7/3/2001 3:16:40 PM Poster : Steve Ward

There are two difficulties with binary inputs:

1. They add a lot more variables, and
2. Turboprop2 is optimized to make continuous valued predictions, and continuous valued predictions work best with varying numeric data. So predictions are hard with binary data, especially if there aren't lots of other inputs.

The single input approach is not good because it violates the 8th Commandment (see Tips and Techniques on this site.) However, if you code the day in a single input so that the day number increases as some important characteristic of the day increases, it might work better.

Suppose, for example, you believe trading volume makes discrimination by day important. Suppose further that trading in your issue is heaviest on Friday, followed by Monday. Suppose Wednesday is light, but Tuesday and Thursday average the same trading volume, but are lighter yet. Then I'd try Tuesday=1, Thursday=1, Wednesday=2, Monday=3, Friday=4.

Better yet, I'd assign a number based on average trading volume, perhaps scaled between 0 and 10. Then you might wind up with something like Thursday=0.67, Tuesday=0.81, Wednesday=1.22, Monday=8.64, Friday=10.

The other thing you can do is try some of the other neural net types that are in our add-ons, especially the ones that classify instead of predicting. Classification generally works better with binary inputs than prediction does. Adaptive Net Indicators and Neural Indicators classify, so they might be better with binary inputs. Anyone who wants to be really serious about neural nets should own as many addons as they can afford. (I use them all, but of course I get them free.) I actually prefer classifying the market rather than predicting the price, and usually do better that way too.

Steve Ward

Converting to Windows 2000 alert

Date :7/3/2001 5:56:10 PM Poster : Ward.net Webmaster

We have had a number of problems with users converting to Windows 2000 from other operating systems. If you are thinking about doing this, please read what we wrote in Known Major Bugs, Fixes, and Warnings. Thanks.

Re: Converting to Windows 2000 alert

Date :7/3/2001 6:41:40 PM Poster : Steve K

Windows 2000 is a solid operating system. So much better than win98 or early NT in memory handling and stability. I upgraded with very few problems. and going a month without a crash is not uncommon

in fact, i Like win2k so much I'll be very slow to switch to XP when it's released.

The Win2k upgrade is well worth the effort.

Transformation and scaling

Date :7/4/2001 6:06:26 AM Poster : Claude Cherel

Hi everyone,

What do you think about transformation and scaling ?

If I use indexes like DJI, Nasdaq, S&P, as input to a prediction, the values can be very different (10570, 1850, 1245). Can I use
these raw values or is it better to transform them?

I use two things:
- ln(divide(Close,lag(close,5))
- scaling between -1 and 1

Is it important to do this kind of transformation for NeuroShell Trader or does the product deals with raw data without any problem?

Thanks,
Claude

Re: Transformation and scaling

Date :7/9/2001 2:20:58 PM Poster : webmaster@ward.net

The NeuroShell Trader help file includes a topic called "Neural Network Output Discussion". The comments and methods applied to outputs may also be applied to inputs.

Claude:

Actually, scaling is already being done similarly and automatically to inputs and outputs by all of our neural nets except Adaptive Net Indicators. Scaling is NOT being done OUTSIDE of neural nets. The webmaster's comment is about normalizing over time, which isn't being done by NST to inputs, although certain outputs are pretty normalized, e.g., percent change in open. Your formula seems to scale, which isn't necessary, but it also does a little normalizing over time too, so the formula may help and probably won't hurt anything.

However, an alternative to normalizing over time is not going so far back to when the issue was trading at an entirely different level. Frankly, I think the trading patterns for DELL, for example, were a lot different before the big bull market, and changed again when the bear market started. So I don't think normalizing over time always helps.

Re: Transformation and scaling

Date :7/13/2001 3:50:19 AM Poster : claude cherel

Thank you Steve for your clear answer. Now I know what to do about scaling and normalizing on time.

For the second part of your answer, I understand that I could use raw data like close, open, volume ... if I decrease the number of bars for each input.
Then in this case I do not have to normalize over time, right?

To resume I identified three types of transformation:
- Scaling : where a formula is used to reduce data (0 to 1, or -1 to 1, etc...) - This is normally done by NST inside neural nets.
- Normalize over time : where a formula is used between the last data and some other data in the past (using lag() for example) - This can be avoid if you decrease the level of observation.
- The 3rd one : where a formula is used between the data and the moving average for the same bar. In this last case is it scaling or normalizing?

Thanks,
Claude

Re: Transformation and scaling

Date :7/13/2001 10:28:19 AM Poster : Steve Ward

Claude - the third case you mention is what I would call normalizing over time. I tend not to use just open, high, low, close and volume. I usually at least use percent change in these things to get some time normalization for them, unless the price range has been pretty narrow during my training or optimization period. That's because scaling only serves to make sure all neural inputs are in the same range, but scaling does nothing to resolve the fact that a $1 move is not a big deal when the stock is at $150, but it was a big deal when the stock was at $10. Think of scaling as normalizing over many inputs (vertical), whereas time normalization normalizes over one variable (horizonal).

Emergency Alert for Quote.com Users (7/5/01)

Date :7/5/2001 4:23:23 PM Poster : Maciej

Thanks for the update. It has cleared my quote.com download problem. One caveat, the zip file assumes that my winnt\system32 directory is on the C: drive. In my case that's not correct its on my G: drive so if you use a drive other than C: you'll have to cut and paste it.

PS I use W2000 and find that's its much more stable than NT. No issues with NST.

Regards

Chart scale "freezing"

Date :7/8/2001 7:16:01 AM Poster : Jimmy Raineri

It there any way to have the trader use a "fixed" scale on the charts?

It is almost impossible to manually scroll across a chart looking for specific combinations or patterns when the scale of the indicator you are looking at keeps changing as you scroll.

Thanks!

Re: Chart scale

Date :7/9/2001 3:01:12 PM Poster : Ann

The Edit Menu, Format Chart, Y axis tab allows you to set minimum and maximum values for the Y axis for daily, weekly, or monthly charts.

Ann

looking unduely into the future

Date :8/3/2001 5:41:11 AM Poster : albertl

Hello all wizzards,
This is also contribution to the leading indicator discussion.
So, we are not supposed to use e.g. 2day % close prediction as input to a second 2day % close prediction. But what about using the actual signal , say of a 2 day prediction as input to a 10day prediction. If using the out of sample signal of the 2 day prediction as input to the 10 day prediction is acceptable, why shouild the use of the actual signal not be acceptable?
albert

p.s: part_copy of mail to support:>
.....4) Is there any possibilty of mistakingly getting out of sample data mixed in my final prediction (an unacceptable hindsight) by using actual signals of different predictions as inputs to my final prediction...I hope not..I am extremely surprised how the out of sample results (1year I use) can jump to over 140% based on predictions which themselves bring 30% or 50% in out of sample. (in stocks and even in currencies)
ANSWER:
The Out of Sample data is not mixed in with the final prediction, but are you feeding in the Actual Signal data stream (ie the blue line)? This line should only be used for visual analysis. Use the green Out of Sample Signal to feed in as an input to another prediction.

Re: looking unduely into the future

Date :8/3/2001 9:20:57 AM Poster : Steve Ward

You can certainly use any prediction of the future as an input to any other prediction of the future as long as you make sure no information known only in the future slips in anywhere. This means in particular that you should:

1. use the out-of-sample net as input
2. make sure your inputs are not known only in the future

For any prediction, you should never feed in the lead indicator as an input. It gives you information you could not know at the time you make a prediction, so it can't be an input.

The actual signal is basically a lead of the output and so it also gives you information only known in the future.

A prediction of the future is made from information NOT known only in the future, so a prediction is ok as an input. It is just a guess at the output, and not the actual output itself.

Is the above clear, or should I rephrase it?

Re: New look and feel for forum??

Date :8/6/2001 9:42:57 PM Poster : Steve Kratochvil

I do have this to say. I love the look and feel of another site, also the very timely posting of "INSTANTLY" is just killer. The down side to it is topics and content. The facts are that they have a killer site and nobody is using it because it has no real clear topic or content. I think that if Ward used/bought/absorbed/in all other ways accuired, it's technology that we would have a great place to almost chat and keep very organized. Besides that it would be a fresh look. I just finished the AI College course and the way that the Fourm there is designed was of little notice. Yes it was a little different but still the same. That is my over inflated opinion for the day.

Thanks,

Steve

quote.com recommended service

Date :8/7/2001 10:28:02 AM Poster : Ken Giuffre MD

Fellow users of neuroshell trader pro and day trader pro...anyone out there using quote.com for their data?
If so what level of service have you found useful for both non-day trading and for day trading? Please advise. Would be a useful thread for all if someone could post an encompassing article reviewing all available data sources and pricing...
best,
Ken Giuffre

Re: quote.com recommended service

Date :8/7/2001 11:26:17 AM Poster : Maxwell Craven

For the Pro, take a look at the January thread called "End of day data sources besides HistoryBank". For the DayTrader, Quote.com is the only one that Ward supports right now.

Selective Input Periods

Date :8/7/2001 6:30:14 PM Poster : zhazam

Steve or anyone ...

From what I've read on the threads and boards, NNs works well on securities that are in trading ranges. However, not all securities trade in trading ranges all the time. Many securities trade in ranges, trend and then trade in ranges again. Is there a way for me to dummy out the trending part of the market so I just show the NN the trading ranges?

I tried to make the trending periods have 0 inputs (for what ever indicator I use) because NeuroShell's input time frame is continuous. I'm not sure if the 0 inputs into the NN will actually give me the desired "don't look at this data point" affect on the NN. A "null" output that would force the NN to ignore the particular time period (minute, day , month, etc) would probably be more appropriate.

Thanks in advance

Re: Selective Input Periods

Date :8/8/2001 1:39:46 PM Poster : webmaster@ward.net

The neural nets in the prediction wizard will ignore any bars in which one if the inputs is missing, so this is the NULL you are seeking. Zero doesn't indicate missing, but you can force an indicator to be missing by sending an asterisk to the chart. If you didn't read this, don't worry, it is largely undocumented.

For example, suppose you didn't want the net to include Mondays in the training set. Suppose further that you had the RSI as an input to the net. Then change that input to the following Rule indicator (see the Rules category):

IF condition=Monday Flag then * else RSI

Now all you have to do is come up with some indicator you can put in the condition to tell you when you are in a trend. Maybe when closes get successively higher or successively lower.

If you have the DayTrader, you can select time ranges, but not date ranges. However, you can read those asterisks in via a text file as Other Instrument Data, for example, or even in one with the same name as the stock, e.g. DELL.CSV. Below is the first few lines of one we made for Dell, with a new indicator called Trending that would be missing when we wanted to show a trend. We just made it zero otherwise, but of course it could be anything.

Date,Trending
1/1/2001,0
1/2/2001,0
1/3/2001,0
1/4/2001,*
1/5/2001,*
1/6/2001,*
1/7/2001,*
1/8/2001,*
1/9/2001,*
1/10/2001,*
1/11/2001,*
1/12/2001,*
1/13/2001,*
1/14/2001,*
1/15/2001,0
1/16/2001,0
1/17/2001,0
1/18/2001,0
1/19/2001,0
1/20/2001,0

Re: Selective Input Periods

Date :9/20/2001 3:10:25 PM Poster : webmaster@ward.net

There was an error in the post to which this message replies. Actually, the Prediction Wizard will only ignore bars for which ALL inputs are missing. We should have suggested that the output be enclosed in the IF indicator, because the Prediction Wizard will also ignore any bars in which the output is missing. Sorry for the mistake.

Note that to enclose the output in IF-THEN you will have to use your own indicator as an output, not allowing the Prediction Wizard to build it for you. E.g. if predicting change in close 3 days ahead, insert a 3 day change in close indicator (momentum). Then predict that 3 days ahead.

Re: Selective Input Periods

Date :10/2/2001 4:59:38 PM Poster : webmaster@ward.net

We now really regret ever trying to tell our users how to do selective training with neural nets. As the tech support Q&A we received below will show, trying to do that sort of thing opens a big nasty can of worms that you will wish you had never opened. The Q&A is just the tip of the iceberg. We can't spend more time doing tech support on this, and we may even delete this thread in the future. Therefore, please take our advice and DON'T try to do the selective training we mentioned in this thread. As our CEO would say: the juice isn't worth the squeeze!

Q. The attached chart is trained on data through 9/28 and the chart shows that. But, the prediction analysis, statistics and the trade by trade stop at 8/24. Can you help with this.

A. The problem where the prediction stops training at 8/24 is a result of how many bars ahead you are predicting. Because you have constrained the output, the number of bars ahead is actually the number of constrained bars ahead and not the actual number of bars ahead. Therefore since you are looking 40 bars ahead, the prediction is actually looking 40 constrained bars ahead, and since you only have 2 bars per day, it is actually looking 20 days ahead. So the prediction can only train up until August because it needs to look 20 days ahead.

The way around this problem is to put the lead into the output before the bars are constrained instead of letting the prediction lead the output. By doing so, the lead will be the number of bars ahead instead of the number of constrained bars ahead. As an example, if you wanted to make one prediction a day and you want to predict the change between 9:30 and 9:00 at 9:00 on a 1 minute bar chart, you would use the following output and set the number of bars ahead to 0 in the prediction wizard:

IfThenElse(Time=9:00, Lead(Change(Close,30),30), *)

aicollege

Date :8/12/2001 10:52:58 AM Poster : John Porter

Is the aicollege course useful for those not running NST Professional or Day Trader? I'm currently running the standard version but am interested in the course. I would really like to expand my understanding of what to predict and valuable net inputs.

I've got some nets that predict rather well but haven't been able to make a satisfactory trading system from them yet.

Re: aicollege

Date :8/13/2001 9:06:50 AM Poster : Steve Ward

It may be useful for you to take the course, but I'd say nearly half of the course involves the optimizer and custom indicators which you don't have. So some of your money will be wasted, so to speak, unless you are considering upgrading to the Pro or DayTrader Pro soon. If any of you who have taken the course want to add your view of John's question, please feel free.

spreads and portfolios

Date :8/12/2001 4:55:14 PM Poster : albertl

Hello,
Try this: open a new chart for ATHM (any small value stock) insert an indicator for the sum of CIEN, BGEN , ATHM (close) If you like, multiply each stock by the the number of your shares. You get a nice chart of your portfolios value. However, if you try to go further you will have a surprise: insert a prediction (correctly done for say % change of the above mentioned sum of your stocks), for better illustration, insert an indicator of the total of your equity for all trades :: you will notice that the trader is ignoring your sum indicator and is just predicting ATHM. How to do portfolio or spread predictions?

albertl

Re: spreads and portfolios

Hello Xprog,
I cannot imagine my portfolio approach is uncommon. Any equity can be modeled and predicted in principle.
1)Just consider a portfolio (a sum of distinct stocks or contracts) as an equity on its own rights, assume may be you have two such portfolios and you consider going short on one and long or flat on another.
2)Obviously spreads are well worth predicting to future and currency traders
3)Composing ones own (industry) group index for use in a prediction is also an idea directly related
Now a question to Steve Ward:
do I need Turboprop for this, assuming I am to lazy to manipulate the data stream itself (creating new tickers)
Thx
albert

I did your portfolio test without any problem. I think what you are missing is this: you have to go the the bottom of the dropdown box where you select what to predict - and select Other Data/Indicators. Find the indicator there that you built. If you select percent change in close, you are predicting the percent change in close of the primary issue in the chart, not your indicator.

I do have a suggestion, though. Don't use the number of shares as a multiplier for the stock. Use the fraction of the shares which that issue represents in your portfolio. For example, if you have 200 shares of CIEN, 200 of BGEN , and 400 of ATHM, then your indicator might be:

0.25 * CIEN + 0.25 * BGEN + 0.5 * ATHM

I didn't understand your question about manipulating the data stream itself.

Re: spreads and portfolios

Date :8/16/2001 3:45:20 PM Poster : albertl

Sorry, to insist:

I did do the prediction correctly: I really predicted the change of my freshly designed "PORTFOLIO INDICATOR" which is a (weighted) sum of the different stocks in my portfolio.

I underline, this was NOT the usual % close or any other of the standard choices in the dropdown box like %change of open or close or optimal buy/sell etc of the primary issue as you call it).

So I did use the option OTHER DATA/INDICATORS at the bottom of the drop down box.

Allow me to take the issue back to the beginning:

1) open a new chart, this time say with ARWM, which is a low value stock showing a very distinctive pattern (not present in BGEN or CIEN)
this chart ranges roughly between 1 and 4 $
2) build and insert the "portfolio indicator" say 100*CIEN + 100*BGEN,
for the purpose of better illustration of my point, (although for prediction 0.5*CIEN + 0.5*BGEN would be preferable)
now there is a second chart on the screen ranging roughly 10,000 to 20,000$
3) insert by means of the option "other data/indicators" a prediction of the freshly inserted "portfolio indicator" 10 days in advance (default)

lets say, to make it simple, use as the only input for this prediction the close of CIEN (on its own) If you train for profit (training 5 years/ 3month , 1 out of sample 1year)
returns are respectively minus 6 % and minus 38%

now, as the pop up confirms, we have the graph of " trades pred 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) " inclusive of one crazy buy signal at the beginning of August 2000

BUT THE GRAPH IS THE ONE OF ARWM !
You will say the prediction is correct, it is just inserted in the graph of ARWM,
"the primary issue in the chart"

4) Insert the indicator "system equity all trades" from the category "trading strategy System information" for trading strategy "trades predicted 10 day
ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

If the prediction and the trades concern our "portfolio indicator, the equity should range in the 5000 $ area , as since august 2000 the "portfolio" has dropped from 15,000 $ to under 10,000$.

HOWEVER The system equity chart is however showing only between 1 and 2 $ loss !!!!

The system equity's chart pop up name is though very clearly " SYSTEM EQUITY (trades predicted 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

This time we cannot say the graph is the one of the "primary issue" but the prediction is right (the system equity).

The graphed equity is definitely not the correct one and that is why I still suspect the trades predicted are not correct either, both probably are only related to ARWM "the primary issue" in the chart, and not to what their names (pop ups) say.

Thanks for yor patience
albertl

If I'm understanding you correctly, and I think I am, you can certainly predict that indicator, and the prediction signal will be for the indicator. However, you cannot trade it as though it were a stock itself. The Trader always assumes you are trading the primary issue in the chart, and that is why the trading and system equity is for the primary issue in the chart. The Trader is making trades for you on ARWM based upon whether the prediction of your indicator is above or below some threshold. The fact that it says "Trades: pred 10 day ADD2..." is just the name of the trading strategy, so named because it uses your indicator (pred 10 day ADD2 etc.) to make the trades.

However, if you want the predicted value of the indicator, you have it. To verify that it is correct, predict 0 days ahead and feed in as inputs CIEN and BGEN. The neural net will discover the coefficients in your formula and get the prediction 100% right.

On 8/16/2001 3:45:20 PM albertl wrote:
Sorry, to insist:

I did do the prediction correctly: I really predicted the change of my freshly designed "PORTFOLIO INDICATOR" which is a (weighted) sum of the different stocks in my portfolio.

I underline, this was NOT the usual % close or any other of the standard choices in the dropdown box like %change of open or close or optimal buy/sell etc of the primary issue as you call it).

So I did use the option OTHER DATA/INDICATORS at the bottom of the drop down box.

Allow me to take the issue back to the beginning:

1) open a new chart, this time say with ARWM, which is a low value stock showing a very distinctive pattern (not present in BGEN or CIEN)
this chart ranges roughly between 1 and 4 $
2) build and insert the "portfolio indicator" say 100*CIEN + 100*BGEN,
for the purpose of better illustration of my point, (although for prediction 0.5*CIEN + 0.5*BGEN would be preferable)
now there is a second chart on the screen ranging roughly 10,000 to 20,000$
3) insert by means of the option "other data/indicators" a prediction of the freshly inserted "portfolio indicator" 10 days in advance (default)

lets say, to make it simple, use as the only input for this prediction the close of CIEN (on its own) If you train for profit (training 5 years/ 3month , 1 out of sample 1year)
returns are respectively minus 6 % and minus 38%

now, as the pop up confirms, we have the graph of " trades pred 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) " inclusive of one crazy buy signal at the beginning of August 2000

BUT THE GRAPH IS THE ONE OF ARWM !
You will say the prediction is correct, it is just inserted in the graph of ARWM,
"the primary issue in the chart"

4) Insert the indicator "system equity all trades" from the category "trading strategy System information" for trading strategy "trades predicted 10 day
ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

If the prediction and the trades concern our "portfolio indicator, the equity should range in the 5000 $ area , as since august 2000 the "portfolio" has dropped from 15,000 $ to under 10,000$.

HOWEVER The system equity chart is however showing only between 1 and 2 $ loss !!!!

The system equity´s chart pop up name is though very clearly " SYSTEM EQUITY (trades predicted 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

This time we cannot say the graph is the one of the "primary issue" but the prediction is right (the system equity).

The graphed equity is definitely not the correct one and that is why I still suspect the trades predicted are not correct either, both probably are only related to ARWM "the primary issue" in the chart, and not to what their names (pop ups) say.

Thanks for yor patience
albertl

On 8/15/2001 4:54:50 PM Steve Ward wrote:
I did your portfolio test without any problem. I think what you are missing is this: you have to go the the bottom of the dropdown box where you select what to predict - and select Other Data/Indicators. Find the indicator there that you built. If you select percent change in close, you are predicting the percent change in close of the primary issue in the chart, not your indicator.

I do have a suggestion, though. Don't use the number of shares as a multiplier for the stock. Use the fraction of the shares which that issue represents in your portfolio. For example, if you have 200 shares of CIEN, 200 of BGEN , and 400 of ATHM, then your indicator might be:

0.25 * CIEN + 0.25 * BGEN + 0.5 * ATHM

I didn't understand your question about manipulating the data stream itself.

On 8/15/01 10:25:21 AM albertl wrote:
Hello Xprog,
I cannot imagine my portfolio approach is uncommon. Any equity can be modeled and predicted in principle.
1)Just consider a portfolio (a sum of distinct stocks or contracts) as an equity on its own rights, assume may be you have two such portfolios and you consider going short on one and long or flat on another.
2)Obviously spreads are well worth predicting to future and currency traders
3)Composing ones own (industry) group index for use in a prediction is also an idea directly related
Now a question to Steve Ward:
do I need Turboprop for this, assuming I am to lazy to manipulate the data stream itself (creating new tickers)
Thx

He maybe could do what you said Chris, but I'm wondering why he would want to? For portfolio management I use Genehunter as I was advised some time ago by wardsystems. Also take a look at the post by Steve Ward back in 2000 called Portfolio Optimization. What you want to do, it seems to me, is buy and sell components of the portfolio so that the whole thing is optimized for profit and maybe minimized for risk. Genehunter has an example of that, but there are also lots of other optimization schemes that can be done in Genehunter. Now I used to be a programmer so I don't have any problem using the Excel formulas and such, because GeneHunter requires programming-like talent to make all those formulas. So I'd make sure I was comfortable with using Excel formulas before I sat down with Genehunter, but I don't really think you actually need to be a programmer.

Re: spreads and portfolios

Date :8/19/2001 12:10:30 PM Poster : albertl

Hello Xprog,

There are many reason to do what he is doing...

1)Yes the aim is also risk reduction. Take delta neutral trading as an example.
2)Any option trader would need it (straddle,butterfly....). I am not a specialist here
3)trading against the market is suicide, and using a strategy in NS where you cannot put a Nasdaq buy or sell signal as one of the entry or exit conditions directly in the strategy itself is really pity.
4)I am trading from Europe. I should calculate my US portfolio in Euro currency the way I explained... In order to take the exit door when it is time, and switch if necessary to an european portfolio
5) I start currency trading, two contracts in different currencies (= one single and may be smaller risk), they should be traded together...
Any other idea where the approach is useful or even necessary...?...sure But any suggestion how to get the NS trader nevertheless do it is highly appreciated.

Genehunter has an example of that, but there are also lots of other optimization schemes that can be done in Genehunter. Now I used to be a programmer so I don't have any problem using the Excel formulas and such, because GeneHunter requires programming-like talent to make all those formulas. So I'd make sure I was comfortable with using Excel formulas before I sat down with Genehunter, but I don't really think you actually need to be a programmer.

albert i just use adaptive turboprop 2 and which looks just like an indicator - so there's no issue of trades i just get a prediction. but if you want trading signals for these combination portfolios you are building you can build a text file for them and give them your own ticker symbol. you can put open high low etc in the text file. then they'll be the primary issue inthe chart

On 8/16/2001 4:38:14 PM Steve Ward wrote:
If I'm understanding you correctly, and I think I am, you can certainly predict that indicator, and the prediction signal will be for the indicator. However, you cannot trade it as though it were a stock itself. The Trader always assumes you are trading the primary issue in the chart, and that is why the trading and system equity is for the primary issue in the chart. The Trader is making trades for you on ARWM based upon whether the prediction of your indicator is above or below some threshold. The fact that it says "Trades: pred 10 day ADD2..." is just the name of the trading strategy, so named because it uses your indicator (pred 10 day ADD2 etc.) to make the trades.

However, if you want the predicted value of the indicator, you have it. To verify that it is correct, predict 0 days ahead and feed in as inputs CIEN and BGEN. The neural net will discover the coefficients in your formula and get the prediction 100% right.

On 8/16/2001 3:45:20 PM albertl wrote:
Sorry, to insist:

I did do the prediction correctly: I really predicted the change of my freshly designed "PORTFOLIO INDICATOR" which is a (weighted) sum of the different stocks in my portfolio.

I underline, this was NOT the usual % close or any other of the standard choices in the dropdown box like %change of open or close or optimal buy/sell etc of the primary issue as you call it).

So I did use the option OTHER DATA/INDICATORS at the bottom of the drop down box.

Allow me to take the issue back to the beginning:

1) open a new chart, this time say with ARWM, which is a low value stock showing a very distinctive pattern (not present in BGEN or CIEN)
this chart ranges roughly between 1 and 4 $
2) build and insert the "portfolio indicator" say 100*CIEN + 100*BGEN,
for the purpose of better illustration of my point, (although for prediction 0.5*CIEN + 0.5*BGEN would be preferable)
now there is a second chart on the screen ranging roughly 10,000 to 20,000$
3) insert by means of the option "other data/indicators" a prediction of the freshly inserted "portfolio indicator" 10 days in advance (default)

lets say, to make it simple, use as the only input for this prediction the close of CIEN (on its own) If you train for profit (training 5 years/ 3month , 1 out of sample 1year)
returns are respectively minus 6 % and minus 38%

now, as the pop up confirms, we have the graph of " trades pred 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) " inclusive of one crazy buy signal at the beginning of August 2000

BUT THE GRAPH IS THE ONE OF ARWM !
You will say the prediction is correct, it is just inserted in the graph of ARWM,
"the primary issue in the chart"

4) Insert the indicator "system equity all trades" from the category "trading strategy System information" for trading strategy "trades predicted 10 day
ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

If the prediction and the trades concern our "portfolio indicator, the equity should range in the 5000 $ area , as since august 2000 the "portfolio" has dropped from 15,000 $ to under 10,000$.

HOWEVER The system equity chart is however showing only between 1 and 2 $ loss !!!!

The system equity's chart pop up name is though very clearly " SYSTEM EQUITY (trades predicted 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

This time we cannot say the graph is the one of the "primary issue" but the prediction is right (the system equity).

The graphed equity is definitely not the correct one and that is why I still suspect the trades predicted are not correct either, both probably are only related to ARWM "the primary issue" in the chart, and not to what their names (pop ups) say.

Thanks for yor patience
albertl

On 8/15/2001 4:54:50 PM Steve Ward wrote:
I did your portfolio test without any problem. I think what you are missing is this: you have to go the the bottom of the dropdown box where you select what to predict - and select Other Data/Indicators. Find the indicator there that you built. If you select percent change in close, you are predicting the percent change in close of the primary issue in the chart, not your indicator.

I do have a suggestion, though. Don't use the number of shares as a multiplier for the stock. Use the fraction of the shares which that issue represents in your portfolio. For example, if you have 200 shares of CIEN, 200 of BGEN , and 400 of ATHM, then your indicator might be:

0.25 * CIEN + 0.25 * BGEN + 0.5 * ATHM

I didn't understand your question about manipulating the data stream itself.

On 8/15/01 10:25:21 AM albertl wrote:
Hello Xprog,
I cannot imagine my portfolio approach is uncommon. Any equity can be modeled and predicted in principle.
1)Just consider a portfolio (a sum of distinct stocks or contracts) as an equity on its own rights, assume may be you have two such portfolios and you consider going short on one and long or flat on another.
2)Obviously spreads are well worth predicting to future and currency traders
3)Composing ones own (industry) group index for use in a prediction is also an idea directly related
Now a question to Steve Ward:
do I need Turboprop for this, assuming I am to lazy to manipulate the data stream itself (creating new tickers)
Thx

Hi Chris,

May be...thanks for the suggestion, although it would be a pity to use simple rules and not neural signals, we all are neural net fans, I believe, Metastock is belonging to the past isnt it? It would be much nicer to use NS's possibilities.
Setting up predictive trade signals ourselves would be a better solution, what leads me to the question :how the trading signals are reached within the prediction wizzard, say for optimat buy/sell? Are they neural NET OUTPUTS or are they outputs of normal trading strategy rules fed with net signals (predictions)? Has anybody managed predicting trade signals of similar quality to the inbuilt ones ?

Hello Chris,

I understand you like to set up trading strategies yourself, not using the inbuilt trade signals of the Prediction Wizzard, and based on thresholds of out of sample signals.Can you give me any idea of the degree of sophistication you go into?
You recommend also I should simply set up a trading strategy based on thresholds of out of sample signals of my indicator , say of a spread , of a sum or even a ratio of two exchange rates.
Are you happy with the test results of your "manually set up "strategies?
I have looked for example at the result of the trading strategies "standard deviation and ATR bands" for the Swiss Franc.
I would call these two strategies non neural or classical. The test results are, without optmization (I use the simple trader) strictly unsatisfactory.
But if I put some of the elements used for calculation of the bands as well as the trading strategies long entry order signals as inputs to a simple prediction (optimal % change open 10 days) of the prediction wizzard, I get satisfactory results already.
This seems to prove to me that setting up a non neural (classical)strategy will need an effort of a much higher degree of difficulty and I even doubt the predictive quality will reach that of a neural prediction of trade signals, which I assume is done in the prediction wizzard.
That is also the reason why I would like to have more details about the Prediction Wizzard´s inbuilt trading signals, especially if they are neural signals .

Also take a look at the post by Steve Ward back in 2000 called Portfolio Optimization. What you want to do, it seems to me, is buy and sell components of the portfolio so that the whole thing is optimized for profit and maybe minimized for risk. Genehunter has an example of that, but there are also lots of other optimization schemes that can be done in Genehunter. Now I used to be a programmer so I don't have any problem using the Excel formulas and such, because GeneHunter requires programming-like talent to make all those formulas. So I'd make sure I was comfortable with using Excel formulas before I sat down with Genehunter, but I don't really think you actually need to be a programmer.

albert i just use adaptive turboprop 2 and which looks just like an indicator - so there's no issue of trades i just get a prediction. but if you want trading signals for these combination portfolios you are building you can build a text file for them and give them your own ticker symbol. you can put open high low etc in the text file. then they'll be the primary issue inthe chart

On 8/16/2001 4:38:14 PM Steve Ward wrote:
If I'm understanding you correctly, and I think I am, you can certainly predict that indicator, and the prediction signal will be for the indicator. However, you cannot trade it as though it were a stock itself. The Trader always assumes you are trading the primary issue in the chart, and that is why the trading and system equity is for the primary issue in the chart. The Trader is making trades for you on ARWM based upon whether the prediction of your indicator is above or below some threshold. The fact that it says "Trades: pred 10 day ADD2..." is just the name of the trading strategy, so named because it uses your indicator (pred 10 day ADD2 etc.) to make the trades.

However, if you want the predicted value of the indicator, you have it. To verify that it is correct, predict 0 days ahead and feed in as inputs CIEN and BGEN. The neural net will discover the coefficients in your formula and get the prediction 100% right.

On 8/16/2001 3:45:20 PM albertl wrote:
Sorry, to insist:

I did do the prediction correctly: I really predicted the change of my freshly designed "PORTFOLIO INDICATOR" which is a (weighted) sum of the different stocks in my portfolio.

I underline, this was NOT the usual % close or any other of the standard choices in the dropdown box like %change of open or close or optimal buy/sell etc of the primary issue as you call it).

So I did use the option OTHER DATA/INDICATORS at the bottom of the drop down box.

Allow me to take the issue back to the beginning:

1) open a new chart, this time say with ARWM, which is a low value stock showing a very distinctive pattern (not present in BGEN or CIEN)
this chart ranges roughly between 1 and 4 $
2) build and insert the "portfolio indicator" say 100*CIEN + 100*BGEN,
for the purpose of better illustration of my point, (although for prediction 0.5*CIEN + 0.5*BGEN would be preferable)
now there is a second chart on the screen ranging roughly 10,000 to 20,000$
3) insert by means of the option "other data/indicators" a prediction of the freshly inserted "portfolio indicator" 10 days in advance (default)

lets say, to make it simple, use as the only input for this prediction the close of CIEN (on its own) If you train for profit (training 5 years/ 3month , 1 out of sample 1year)
returns are respectively minus 6 % and minus 38%

now, as the pop up confirms, we have the graph of " trades pred 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) " inclusive of one crazy buy signal at the beginning of August 2000

BUT THE GRAPH IS THE ONE OF ARWM !
You will say the prediction is correct, it is just inserted in the graph of ARWM,
"the primary issue in the chart"

4) Insert the indicator "system equity all tradea" from the category "trading strategy System information" for trading strategy "trades predicted 10 day
ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

If the prediction and the trades concern our "portfolio indicator, the equity should range in the 5000 $ area , as since august 2000 the "portfolio" has dropped from 15,000 $ to under 10,000$.

HOWEVER The system equity chart is however showing only between 1 and 2 $ loss !!!!

The system equity´s chart pop up name is though very clearly " SYSTEM EQUITY (trades predicted 10 day ADD2(MUL2(100,BGEN CLOSE)MUL2(100,CIEN CLOSE)) "

This time we cannot say the graph is the one of the "primary issue" but the prediction is right (the system equity).

The graphed equity is definitely not the correct one and that is why I still suspect the trades predicted are not correct either, both probably are only related to ARWM "the primary issue" in the chart, and not to what their names (pop ups) say.

Thanks for yor patience
albertl

On 8/15/2001 4:54:50 PM Steve Ward wrote:
I did your portfolio test without any problem. I think what you are missing is this: you have to go the the bottom of the dropdown box where you select what to predict - and select Other Data/Indicators. Find the indicator there that you built. If you select percent change in close, you are predicting the percent change in close of the primary issue in the chart, not your indicator.

I do have a suggestion, though. Don't use the number of shares as a multiplier for the stock. Use the fraction of the shares which that issue represents in your portfolio. For example, if you have 200 shares of CIEN, 200 of BGEN , and 400 of ATHM, then your indicator might be:

0.25 * CIEN + 0.25 * BGEN + 0.5 * ATHM

I didn't understand your question about manipulating the data stream itself.

On 8/15/01 10:25:21 AM albertl wrote:
Hello Xprog,
I cannot imagine my portfolio approach is uncommon. Any equity can be modeled and predicted in principle.
1)Just consider a portfolio (a sum of distinct stocks or contracts) as an equity on its own rights, assume may be you have two such portfolios and you consider going short on one and long or flat on another.
2)Obviously spreads are well worth predicting to future and currency traders
3)Composing ones own (industry) group index for use in a prediction is also an idea directly related

Now a question to Steve Ward:
do I need Turboprop for this, assuming I am to lazy to manipulate the data stream itself (creating new tickers)
Thx
albert

Re: spreads and portfolios

Date :8/28/2001 1:20:38 PM Poster : chris wong

albert the strategies the prediction wizard builds are just threshold rules like if prediction > x then buy. so if you want to build similar rules in the trading strategy it is very simple. if you do that your nets don't have to be on the primary issue, even though your trading strategy is. i dont usually build more complex neural net rules but i like to combine several rules into one strategy - to me thats the power of nstp. like buying when two nets are up or when one net and an indicator are up. lately i've been using the neural indicators and cluster addons because they don't learn to predict anything - they just learn to give a signal unrelated to predicting anything. hope this helps.

On 8/25/2001 1:15:25 PM albertl wrote:

Hello Chris,

I understand you like to set up trading strategies yourself, not using the inbuilt trade signals of the Prediction Wizzard, and based on thresholds of out of sample signals.Can you give me any idea of the degree of sophistication you go into?
You recommend also I should simply set up a trading strategy based on thresholds of out of sample signals of my indicator , say of a spread , of a sum or even a ratio of two exchange
rates.
Are you happy with the test results of your "manually set up "strategies?
I have looked for example at the result of the trading strategies "standard deviation and ATR bands" for the Swiss Franc.
I would call these two strategies non neural or classical. The test results are, without optimization (I use the simple trader) strictly unsatisfactory.
But if I put some of the elements used for calculation of the bands as well as the trading strategies long entry order signals as inputs to a simple prediction (optimal % change open 10 days) of the prediction wizzard, I get satisfactory results already..
This seems to prove to me that setting up a non neural (classical)strategy will need an effort of a much higher degree of difficulty and I even doubt the predictive quality will reach that of a neural prediction of trade signals, which I assume is done in the prediction wizzard.
That is also the reason why I would like to have more details about the Prediction Wizzard's inbuilt trading signals, especially if they are neural signals .
albertl

On 8/21/2001 1:18:18 PM chris wong wrote:
albert the neural net signals are called out-of-sample signal. you can use them in rules like if then and a>b. i do that all the time. according to your other posts the trading signals from the prediction wizard aren't going to help you much since they are from the primary issue in the chart which was already discussed by you and steve ward. but they're there too called pred > long entry threshold etc. if you insert existing data and calcs you'll see all these things.

On 8/21/2001 10:08:54 AM albert stoffel wrote:
Hi Chris,

May be.. thanks for the suggestion, although it would be a pity to use simple rules and not neural signals, we all are neural net fans, I believe, Metastock is belonging to the past isnt it? It would be much nicer to use NS's possibilities.
Setting up predictive trade signals ourselves would be a better solution, what leads me to the question :how the trading signals are reached within the prediction wizzard, say for optimal buy/sell? Are they neural NET OUTPUTS or are they outputs of normal trading strategy rules fed with net signals (predictions)? Has anybody managed predicting trade signals of similar quality to the inbuilt ones ?
albertl

buy sell signals for the nasdaq strategy are generated by rules. why not just put those same rules for nasdaq into the strategy for your stock?

On 8/19/2001 12:10:30 PM albertl wrote:
Hello Xprog,

There are many reason to do what he is doing...

1)Yes the aim is also risk reduction. Take delta neutral trading as an example.
2)Any option trader would need it (straddle,butterfly ...). I am not a specialist here
3)trading against the market is suicide, and using a strategy in NS where you cannot put a Nasdaq buy or sell signal as one of the entry or exit conditions directly in the strategy itself is really pity.
4)I am trading from Europe. I should calculate my US portfolio in Euro currency the way I explained... In order to take the exit door when it is time, and switch if necessary to an european portfolio
5) I start currency trading, two contracts in different currencies (= one single and may be smaller risk), they should be traded together...
Any other idea where the approach is useful or even necessary...?...sure But any suggestion how to get the NS trader nevertheless do it is highly appreciated.

Re: spreads and portfolios

Date :8/19/2001 11:42:46 AM Poster : albertl

hello Chris,

Thanks for your suggestion.
I understand that also with turboprop2 one can not get trades on a "spread, index or portfolio indicator", but only on the "primary issue in the chart".
Yes Chris, exporting everyday the open,high,low,close and may be volume of this "custom portfolio indicator" or better called "custom data" is a solution. One must though,each time, insert manually the exact wordings "open,high,low,close and may be volume " in replacement of those titles NS is putting.automatically ;
However, I will sooner or later upgrade to intraday, and I should have these trade signals at my disposal in real time.

Bar Interval and optimization range questions

Date :8/13/2001 5:52:17 PM Poster : Jimmy Raineri

1. Is there any way to get intraday intervals other than the "canned" 1,2,5,15, etc other than feeding the data in manually? Quote.com will send bars in whatever intervals are requested - I frequently use 13 minute and 34 minute charts.

2. When indicating a "range" for the optimizer to choose from, is there any way to give it a set of numbers to choose from instead of a range? For example instead of saying 3 to 10 force it to choose from only 3, 5 and 8?

Thanks!

2 Questions and 2 suggestions

Date :8/20/2001 6:35:44 AM Poster : Andrew

Hi all,

I use a NST Pro around half a year already and have couple questions and suggestions to share.

My questions:
1) I extensively use nice feature to write custom indicators via DLL library. Unfortunately there is a limited documentation about interface features NSTP supports. It looks for me that NS assume C style for calling program because once I tried dll compiled with C++ language then custom indicator returns messy program name. Does anybody use C++ to write dll for custom indicator? How should it be declared? Is it valid to use something like
extern "C" __declspec(dllexport) .....
2) I have suspicious that Neuro Shell Trader was written in Visual Basic. Am I right? Probably it explains the bad performance once I simultaneously load several stocks for analysis.

I hope NST developer might consider these ones:
1) I've noticed that the one of most frequently used preprocessors for NN is a logarithm of price. I would suggest to implement the feature to display the price action in logarithmic scale (simple isn't it?) or consider treatment of ln(price) as a normal price then user can use candlesticks of ln(price)
2) Before the day-open I use something similar to "What-If" analysis. I enter fictitious price range for the next trading day and play several scenarios to find out predicted buy/sell signal from the possible price range. This way I build a plan and strategy for my next day. I would suggest to automate this function somehow or, at minimum, to include "Refresh" button so NST could re-read updated price value from my ASCII file.

All constructive remarks are welcomed
Regards
Andrew

Re: 2 Questions and 2 suggestions

Date :8/20/2001 10:21:48 AM Poster : Webmaster@ward.net

The dialog boxes and the outer interface are in the compiled form of Visual Basic. All CPU intensive facilities are in C: indicators, neural nets, charts, genetic algorithm, add-ons. It is important to remember that NST loads everything into memory, and if you have nets with several walk-forwards, or other complex models, your RAM can get eaten up quickly. There are some very large data structures that complex models require, and neural nets in particular require a huge mount of data. If you loaded a bunch of stocks with very simple indicators, you shouldn't see much of a problem, so you have to realize that power requires resources. Our web site now lists a 400MHz Pentium with 64 Megs RAM as the MINIMUM computer NST will run on.

However, the most important thing you can do to keep performance high is not to display much data on the chart, even if you have loaded quite a bit of data. Usually, people display far more than they actually need to see. You adjust this on the Format Chart menu.

2) I have suspicious that Neuro Shell Trader was written in Visual Basic. Am I right? Probably it explains the bad performance once I simultaneously load several stocks for analysis.

I hope NST developer might consider these ones:
1) I've noticed that the one of most frequently used preprocessors for NN is a logarithm of price. I would suggest to implement the feature to display the price action in logarithmic scale (simple isn't it?) or consider treatment of ln(price) as a normal price then user can use candlesticks of ln(price)
2) Before the day-open I use something similar to "What-If" analysis. I enter fictitious price range for the next trading day and play several scenarios to find out predicted buy/sell signal from the possible price range. This way I build a plan and strategy for my next day. I would suggest to automate this function somehow or, at minimum, to include "Refresh" button so NST could re-read updated price value from my ASCII file.

All constructive remarks are welcomed

Andrew

Notice about performance

Date :8/21/2001 5:54:02 AM Poster : Andrew

I would like to clarify my notice of performance issues for NST.

In tuning of any system it is important to identify and tune the system bottleneck. Simply speaking let's assume that computer consists from 3 components: hard drive (I/O subsystem), memory and CPU. Any performance-tuning book describes that memory might impact CPU performance through the high level of swapping or paging. I did testing of NST for my PIII 512Hz, 256Mb RAM, 512Mb swap file system on 30Gb 7200rpm hard drive computer. I prepare NST chart with trained networks for 20 stocks for 5 years track of each and monitor computer during simple operation of JUST opening and closing chart in NST. Results: I/O activity was close to zero, swapping was absent, paging was very close to zero but CPU was equal to 100% utilization during 20 minutes of some weird activity. Because NST did not do anything useful during this operation (network was already pre-trained) then I conclude that all CPU was waisted on the chart initialization process. Memory and hard drive of computer are not the bottleneck. The real bottleneck is a CPU may be due to inefficient algorithms of memory allocation or chart initialization which are probably done via Visual Basic.

I hope Ward Systems will review these algorithms some days.

On 8/20/2001 10:21:48 AM Webmaster@ward.net wrote:
The dialog boxes and the outer interface are in the compiled form of Visual Basic. All CPU intensive facilities are in C: indicators, neural nets, charts, genetic algorithm, add-ons. It is important to remember that NST loads everything into memory, and if you have nets with several walk-forwards, or other complex models, your RAM can get eaten up quickly. There are some very large data structures that complex models require, and neural nets in particular require a huge mount of data. If you loaded a bunch of stocks with very simple indicators, you shouldn't see much of a problem, so you have to realize that power requires resources. Our web site now lists a 400MHz Pentium with 64 Megs RAM as the MINIMUM computer NST will run on.

However, the most important thing you can do to keep performance high is not to display much data on the chart, even if you have loaded quite a bit of data. Usually, people display far more than they actually need to see. You adjust this on the Format Chart menu.

On 8/20/2001 6:35:44 AM Andrew wrote:
Hi all,

I use a NST Pro around half a year already and have couple questions and suggestions to share.

My questions:
1) I extensively use nice feature to write custom indicators via DLL library. Unfortunately there is a limited documentation about interface features NSTP supports. It looks for me that NS assume C style for calling program because once I tried dll compiled with C++ language then custom indicator returns messy program name. Does anybody use C++ to write dll for custom indicator? How should it be declared? Is it valid to use something like
extern "C" __declspec(dllexport) .....

Re: Notice about performance
Date :8/21/2001 10:59:02 AM Poster : webmaster@ward.net

Our programmers strongly disagree with the statement that NST does nothing useful during chart loading. Twenty stocks w/ nets all have to be loaded with data and all of the indicators calculated, then all of the prediction values calculated, then all of the prediction trading points calculated, then all of the the trading statistics as well. Remember, if you have 5 walk forwards, there are 6 neural nets in each stock, and neural nets can be quite large, not to mention all the support structures required for the complex interactions. Any of the indicators that reference Trading Strategy take much longer, because they are somewhat recursive (see the tip called "When optimization is really slow".)

Nevertheless, if your chart takes 20 minutes to load, we think something is definitely wrong, unless you have an awful lot of nets, indicators, etc. Make sure you have deleted old nets, indicators, and strategies that you no longer need but which may be hidden. If it still takes 20 minutes, please send your chart to support@wardsystems.com so we can investigate this. Any performance problems need to be investigated in the context of the chart causing them.

Re: Notice about performance
Date :8/30/2001 4:40:25 PM Poster : Andrew

Dear Webmaster,

Thank you for your advice. Indeed I had a chart in "development" status with lots of different indicators which I used to experiment with NN model and I just simply added 19 more stocks to see how it works - in result I got a bad performance.
After I cut almost everything and left 3 indicators as price, actual and predicted signal then NN performance improved significantly. From now on I am using "simplified" version of NN in production status.

BTW: It is not an easy staff to start using NeroShell correctly because it requires at least minimal understanding what is a statistical science of time series predictions but it gives very valuable support in rough times – I like it.

The Quote.com website is very hard to navigate, but the following section, called Network Updates, talks about that problem. It might not be a bad idea for everyone to check this part of their website if there are any suspected problems.

http://finance.lycos.com/home/about/cserv/network_update.asp

FYI: The Quote.com website says that they have fixed the problem with decimals (for current quotes it appears from my charts), however, the data for August 20th won't be fixed until this weekend.

If you are using daily or hourly bars or even half hour bars, it won't be too hard to modify the bad bars of the 20th. Just double click on the close and scroll down to the 20th. Be sure to modify open, high, low, and close. We suppose moving the decimal two places to the left will do the trick. If you have smaller bars, modifying all those bars will be a pain. However, after this weekend, you may want to delete the files we've saved for the Nasdaq issues. That will ensure that they are reloaded when you load the chart on Monday. If Quote.com does indeed fix the data, the reloading should be correct. The files are in the Data folder of the Servers folder.

Voting of experts and signals

Date :8/29/2001 1:23:12 PM Poster : albertl

Hello Chris, Hello friends,

I also like to join several predictions and have the trading strategy wizzard vote
on them..
I believe it is reasonable, and that is what you are doing, to put only one non neural signal (classical indicator threshold) to vote with a majority of neural signals (threshold of out of sample signals). I assume also you would have optimized that classical indicator.

What surprises me nicely with NST is that voting really works and improves the return%..

I have very bad memories of a classical non neural trading program which uses optimization, forward testing and voting of technical indicators.
The voted signals there are unacceptable although the manufacturer is very proud of his product. He claims over 50% hit rate, but I could not make out any significance at all in his end of day signals.

When putting a group of experts to vote , each expert taken on its own should have sufficient knowledge, meaning a hit rate of say at leat 65%.

I do not see classical indicators having this performance on a regular basis, I see may be 55% to 60%, only exceptionnaly up to 70%

Idiots cannot get cleverer if they vote.in a group..
What is the probablity of a group of five experts each being right 50% on its own and when they vote, say unanimously.? Over 50% or less ? I suspect less .
How right each expert has to be (probability X%) , if the result of the vote must be more than say 70% correct (probability Y %) ?

Should we guess X% --> Y% : 50% --> 40% , 60% --> 65% , 70% --> 70%
Has anybody precise knowledge about such probabilities?

What about optimization in this context?

Idiots cannot get cleverer if they vote in a group is maybe one phrase, but two heads is better than one is another. Maybe your TV doesn't show "Who wants to be a millionaire" where you live, but they have these "lifelines" where if the smart guy in the hotseat gets stumped, he asks the studio audience to vote on what they think the answer is. There is always a spread of votes across the 4 possible answers, but the right answer has the highest number of votes most of the time when I've watched it. I don't think the folks in the audience are any smarter than the dude that wants to be the millionaire, but their experiences cover different areas. Now I can't exactly answer your question because I got a D in statistics, but you call me if you want to know about riding horses and ranching.

Re: Voting of experts and signals

Date :9/21/2001 4:52:16 PM Poster : safigan

Statistically speaking, you should get better results from a majority of experts if each individual expert produces a positive result. If you assume that the average gain is equal to the average loss, then any expert who's right more than 50% produces a positive result.

Correlation between the experts becomes is a big issue. For instance, if the experts always agree (correlation = 1), then using a majority of experts is the same as using one expert. If two experts always disagree (correlation = -1), then their votes always cancel each other out. If each expert is truly independent (correlation = 0), then optimum results are achieved. Correlation would exist if you use correlated (or even the same) inputs for more than one expert.

We can explore a simple example. Let's assume no correlation and two experts. The experts must agree before action is taken. If both expert are correct 60 percent of the time, then together they are correct 1 - (1 - .6)(1 - .6) = 84 percent of the time. Note that correlation almost always exists, so actual results are likely to be much closer (but still higher than) 60 percent.

Re: Voting of experts and signals

Date :9/24/2001 3:33:43 PM Poster : albertl

Hello Saffigan,

Thanks for your your contribution, I was indeed hoping for such a statistical/probabilistic comment. I have some difficulties though admitting , as this formula suggests, that two "30% experts" ("independant i.e. zero correlated idiots") would be blessed with being right 50% !
1 - (1-30%)(1-30%)= 1-49% = 51%
On the other hand this might explain why democracy works relatively well...

Assuming a moving average is 60% right, another indicator say RSI 70% and a 3rd one say CCI 50%, could we hope being right , ignoring corelation, say
1- (1-70%)(1-60%)(1-50%) = 1- 0.3x0.4x0.5=94% ...very unrealistic.. if all three agree ?
How much to estimate correlation between classical indicators?
What about two out of three experts agreeing.?

One of these days I might dig out some books to get rid of this funny feeling that 50% should appear somewhere in the formula...my stomach cannot digest that three times 50% would yield more than 50%...

It does not explain at all how to combine the experts and how to gently switch from one expert or combination to another. Notice that the optimal set of indicators will change through time but at one point to and how do you give more weight to one expert. Using a network of network does not work, try it.

Statistically speaking, you should get better results from a majority of experts if each individual expert produces a positive result. If you assume that the average gain is equal to the average loss, then any expert who's right more than 50% produces a positive result.

Correlation between the experts becomes is a big issue. For instance, if the experts always agree (correlation = 1), then using a majority of experts is the same as using one expert. If two experts always disagree (correlation = -1), then their votes always cancel each other out. If each expert is truly independent (correlation = 0), then optimum results are achieved. Correlation would exist if you use correlated (or even the same) inputs for more than one expert.

We can explore a simple example. Let's assume no correlation and two experts. The experts must agree before action is taken. If both expert are correct 60 percent of the time, then together they are correct 1 - (1 - .6)(1 - .6) = 84 percent of the time. Note that correlation almost always exists, so actual results are likely to be much closer (but still higher than) 60 percent.

I believe it is reasonable, and that is what you are doing, to put only one non neural signal (classical indicator threshold) to vote with a majority of neural signals (threshold of out of sample signals). I assume also you would have optimized that classical indicator.

What surprises me nicely with NST is that voting really works and improves the return%..

I have very bad memories of a classical non neural trading program which uses optimization, forward testing and voting of technical indicators.
The voted signals there are unacceptable although the manufacturer is very proud of his product. He claims over 50% hit rate, but I could not make out any significance at all in his end of day signals.

When putting a group of experts to vote , each expert taken on its own should have sufficient knowledge, meaning a hit rate of say at leat 65%.

I do not see classical indicators having this performance on a regular basis, I see may be 55% to 60%, only exceptionnaly up to 70%

Idiots cannot get cleverer if they vote.in a group..
What is the probabilty of a group of five experts each being right 50% on its own and when they vote, say unanimously.? Over 50% or less ? I suspect less .
How right each expert has to be (probabilitly X%) , if the result of the vote must be more than say 70% correct (probability Y %) ?

Should we guess X% --> Y% : 50% --> 40% , 60% --> 65% , 70% --> 70%
Has anybody precise knowledge about such probabilities?

What about optimization in this context?

Re: Voting of experts and signals

Date :9/30/2001 2:41:00 PM Poster : albertl

Bonjour Sylvain,

One very simple way to give one expert (the best of the predictions) relatively more weight is to put the corresponding trading condition, say the long entry condition, twice in the trading strategy. This is definitely working.

Obviusly one could also try other less direct ways of voting, but the discussion I started was really mainly about the statistical background.

I believe Ward Systems has described two further ways of combining (combining is not really voting) signals, you might want to review the examples, I believe they call it averaging of the signals. Review the examples.

Regarding the variation though time , this is probably absolutely normal in the prediction business. What time'frame ? I have heard about people changing their models evry week and guess this might not even be sufficeint in present times. Maybe some more experienced friends might comment.

Re: Voting of experts and signals

Date :10/9/2001 2:18:29 PM Poster : albertl

Hello All,
I would like to stress that any number of 50% experts will never obtain more than 50% probability of beeing right, even if voting !!!
Lets consider three 50% experts voting unanimously , they have 0.5x0.5x0.5 = 1/8 probability of being right BUT they have the same 1/8 probability to be unanimously wrong !!!
1/8 right versus 1/8 wrong means fifty fifty >>>> 50% is the probability
to reach better results by voting than 50% we need experts better than .50%

Multiple lots

Date :9/1/2001 4:02:21 PM Poster : Jana

I'm sorry for too basic question, but I was wondering if there is possibility to program multiple contract with NeuroshellTrader Professional. Like if I want open a position and then keep adding to it or if I want take partial profits at some point. I would appreciate any suggestions.

Re: Multiple lots

Date :9/4/2001 8:45:56 AM Poster : Webmaster@ward.net

We have something similar but not exactly what you want. There is an option to purchase as many share as your account balance can support. As the price goes down or your profits go up, you will be automatically purchasing more shares. However, there is no mechanism for you to intervene with partial trading in the trading strategy once it gets started.

On 9/1/2001 4:02:21 PM Jana wrote:

Ok, I see. However, there is any reason why this is done this way? I would imagine everybody is using multiple lot systems, also I don't see why it would be difficult to program it. All you would have to add is the feature allowing to buy while already long and allowing close partial positions. Right now after I test some strategy with one lot using Neuroshell Trader I have to write my own routine to backtest it with multiple lots - wastes a lot of time for sure. Any comments how everybody else is solving this problem would be highly appreciated.

Jana, forgive my stupid questions, because I'm just a country boy trying to learn. How would such a partial thing like that work during backtesting? I mean, how would you tell it what to do during optimization or what kind of interface would Ward have to put in to do that? Then if you're in the daytrader and tooling right along, how would you break in and tell it to sell some? Right now, the daytrader gives out the signals -- how would the interface change to allow you to give the signal instead, and a partial lot at that? I'm the first to admit I ain't no programmer, but I'm having trouble visualizing how such a feature would fit logically in with the interface there now what tells you what to do and when to do it, and all of a sudden we'd be telling IT what to do and when to do it?

Re: Multiple lots

Date :9/5/2001 9:49:14 AM Poster : Jana

Everything is very simple indeed. Let say you have condition and tell the Trader to open buy certain number of lots (or sell). All Trader has to do is to keep track of your positions and profit/loss. Right now if I have some condition met to buy, it won't buy anything if I have long position open (which is logical assuming you only have long or short position and size never changes).

Here is an example:

Lets assume my conditions are:

1) buy 1 lot at price level 1 (100)
2) buy 1 lot at price level 2 (120)
3) sell 1 lot at price level 3 (150)
4) sell 1 lot at price level 4 (180)

With Trader right now, assuming price goes from 90 to 200 it will open a position at 100 and will close it at 150 (assuming you use long exit). Of course you can clse your long at 180 but thats not the point.

What I suggest happening is open 1 lot at 100 add another one at 120 (keep track of lots which is 2 and averaged open price which is 110), then close obe lot at 150 getting back to 1 lot at 110 open price plus 40 points of realised profit for second lot.

It makes no difference to the system is it first lot open or not - all it has to do is to determine if certain condition is met and buy/sell specified number of lots and keep track of averaged open price + number of lots.

As far as optimization is concerned system behaves exactly similar to what it does now, no modification is required.

Certainly it can be done (Omega TS is one example of it), also its very easy. Even if it wouldn't be that easy I would be begging developers for adding it since its vital for any real world trading system.

Re: Multiple lots

Date :9/6/2001 8:43:12 AM Poster : Texas Bubba

Now remember, I'm just learning, so it isn't as simple for me. It seems like what you are suggesting is that the same long entry rules we use now can be used for the second lot, and the third, and so on. I don't know about your rules, but mine would keep firing for a while once they start if it wasn't waiting for an exit rule to calm the herd down a little. I mean, I'd be into the second lot on the second bar, and the third lot on the third bar. I use rules like RSI < x. Once it goes over x it stays there a while, so you need something like RSI > x to exit or sell short, right? Neural nets seem to be like this too. So it seems like there'd either have to be some waiting period, or we'd have to put in several more sets of different rules for the other lots, like a different set for each lot, and you'd have to make sure the second set didn't fire right away after the first set. Like the second lot would have to be RSI > x+10, and the third lot is RSI > x+20 or something. Am I playing with a full deck here?

On 9/5/2001 9:49:14 AM Jana wrote:
Everything is very simple indeed. Let say you have condition and tell the Trader to open buy certain number of lots (or sell). All Trader has to do is to keep track of your positions and profit/loss. Right now if I have some condition met to buy, it won't buy anything if I have long position open (which is logical assuming you only have long or short position and size never changes).

Here is an example:

Lets assume my conditions are:

1) buy 1 lot at price level 1 (100)
2) buy 1 lot at price level 2 (120)
3) sell 1 lot at price level 3 (150)
4) sell 1 lot at price level 4 (180)

With Trader right now, assuming price goes from 90 to 200 it will open a position at 100 and will close it at 150 (assuming you use long exit). Of course you can clse your long at 180 but thats not the point.

What I suggest happening is open 1 lot at 100 add another one at 120 (keep track of lots which is 2 and averaged open price which is 110), then close obe lot at 150 getting back to 1 lot at 110 open price plus 40 points of realised profit for second lot.

It makes no difference to the system is it first lot open or not - all it has to do is to determine if certain condition is met and buy/sell specified number of lots and keep track of averaged open price + number of lots.

As far as optimization is concerned system behaves exactly similar to what it does now, no modification is required.

Certainly it can be done (Omega TS is one example of it), also its very easy. Even if it wouldn't be that easy I would be begging developers for adding it since its vital for any real world trading system.

Texas Bubba:

I understnad your question but what you're asking is in fact a bit different question. You're asking about the rules (how to make them, etc.), while my point was to be allowed to use multiple lot feature should you want to. In other words its up to you - you can always trade 1 lot system, but right now multiple lot system traders don't have straight solution.

Anyway, answering your question - the simplest way around your problem with RSI < x example would be add another rule something like open another lot only if you are not long already. I'm sure you can think of multiple variations of it now, but the example with RSI which comes to my mind would be the following:

1) if you're not long yet - open 1 lot long when RSI < 20
2) if you're not 2 lots long yet - open 1 lot if RSI < 10

I'm not discussing the logic behind this example from trading stand point, but general idea would be you don't want to miss the trade so you go long as soon as RSI goes below 20 (without waiting for 10 which may or may not to happen), and then add another lot if it reaches 10. Hope this helps.

performance of Mesa indicators

Date :9/4/2001 9:05:06 AM Poster : albert stoffel

Hello,
I just tested the original Mesa indicators , anybody getting reasonable results without filtering them with RSI, acceleration etc ? On their own they seem very poor even when optimized, at least on currencies (dayly). Am I right?
albert

Re: performance of Mesa indicators

Date :10/4/2001 12:51:41 PM Poster : albert stoffel

I have tested the MESA (the original, not just the MAMA and FAMA) indicators once more. This time I have used intraday data (I have put 1 min bars via EXCEL alongside the date , and suppressed the time information) in my EOD NStrader. I start getting first reasonable results. Can anybody confirm that the MESA indicators do not perform well on daily currency bars, only on intraday bars? I can hardly imagine this would be so.

Can anybody give a suggestion how to use these indicators EOD on currencies?

Overfitting versus WalkForwards

Date :9/6/2001 11:49:51 PM Poster : Torres

There are several warning in the tutorial regarding the dangers of overfitting a prediction, either through the use of too many inputs, neurons, or retrainings.

I am not clear as to how these dangers apply if one is using the WalkForward evaluations.

My confusion stems from my deducing that, if one did overfit, the results of the WalkForward should worsen, so one would never be tempted to use an "overfitted" prediction instead of a "wellfitted" one.

Thanks in advance for any direction.

Re: Overfitting versus WalkForwards

Date :9/10/2001 9:35:56 AM Poster : Steve Ward

I think you are correct that walk forwards will help reduce the danger of overfitting. That is of course why we have them. The problem I see is that the evaluation period could be just like the training period in terms of how the issue "acts". When you go to trade, things might not be the same. The other reason we encourage less inputs, etc. is simply to increase the chances our users will get good models early on instead of becoming discouraged if they use too many inputs and always see bad out-of-sample results.

Few, Long WalkForwards versus Many, Short ones

Date :9/6/2001 11:59:20 PM Poster : Torres

I am naively inclined to believe that a prediction would be much more successful at predicting a series of many short walkforwards, than at predicting a series of a few lenghty ones, which total the same length of time.

The logical step I dare not take, without asking, is whether any such success with a series of many, short walkforwards translates into a better trading system than one chosen by judging results from a series of few, long walkforwards.

Any light shed on this topic would be greatly appreciated.

Re: Few, Long WalkForwards versus Many, Short ones

Date :9/10/2001 9:46:02 AM Poster : Steve Ward

This is an excellent question, and I encourage others to provide their experiences as input. I would like to caution, however, that when making a judgment like this, that you should be looking at the out-of-sample net rather than the individual results of the evaluation periods. The individual evaluation periods are very short trading sessions, unrelated to each other. The out-of sample net is a continuous trading session, and the difference between 'many short' and 'fewer long' walk forwards will then be only how often the net retrains.

Re: Few, Long WalkForwards versus Many, Short ones

Date :9/10/2001 7:54:33 PM Poster : albertl

I modestly submit my newcomer s view:

By feeding our beloved net the best possible information over a sufficently long training period(s), the net is supposed to learn the personality of the market to such an extent that no future situation or pattern will be absolutely new to it.

Breaking up the training period and the associated evaluation period in several smaller entities , apart from training the net in steps , gives the following nformation:

1) if evaluation results are slowly improving : the initial training period could need lengthening
2) if evaluation results fluctuate wildly (or if the evaluation results differ heavily
from the training results)

a)our filters (indicators) have probably not "amplified" the signals sufficiently
so that the
net could not learn some specific patterns occuring during the different
periods
b)our net has not been fed the needed input variable
c) we might have chosen a much too short training period

Why not look at the results of the current net through the same glasses,
instead of just saying the market has changed when the results differ?

pb:
Mr Torres:
I personally do not find it easier to get even results over several shorter periods (with one net ... dont forget that you use in fact one and the same prediction set up (call it system or net) for all different periods.
One single long evaluation period tends to hide and average out the bad trades.

Comments?

albert

Neuroshell Trader will have excellent performance with many short walk forward train test and absolutely dismal performance with few long walk forward tests. Steve Ward and other mathematicians called that overfitting. Overfitting pays much more that the standard philosophy unless the models are extremely well specified.
It is also a bit ridiculous not to be able to optimize whichever objective function we want without optimizing the inputs. I don't see why optimize inputs a year ago would be good for today.

JMA TPL Files Available For Download

Date :9/11/2001 12:55:18 PM Poster : webmaster@ward.net

You may download the JMA TPL Files using this link:

http://www.ward.net/downloads/jmatpl.zip

Please address all concerns with these files on the forum.

Jurik TPL

Date :9/22/2001 9:06:41 AM Poster : Sylvain Gauthier

The Jurik TPL is extremely interesting and probably useful. I just copied it in the template directory and it does not seem to work. Is there a special way to install it ?
What are the parameters and what do they mean ?

Real Time Forecasting

Date :9/22/2001 9:11:51 AM Poster : Sylvain Gauthier

Did you have any sucess with real time neural nets forecasting ? Do you have any concrete examples ?

I also notice that the optimal set of indicators is changing slowly through time. I suppose that using three nets with diffrent indicators would solve the problem but how these nets should be combined at a specific point in time ?

Status Flags

Date :9/25/2001 4:10:40 PM Poster : Mike Oldroyd

In a number of situations, I keep finding myself wanting to set flags or variables, that can then be referred to as parameters for other indicators.

An example would be, I would like to generate an alert to close a long position, only if I am in a long position (ie the last open long position alert was more recent than the last close long position alert).

Another example would be where I would like to trade on a number of crossover signals that happen close together, but not at exactly the same time. With some kind of status flag, I produce an indicator along the lines of "1 if crossabove in the last x bars else 0".

I realise that there could be other ways round both these examples, but being able to set some kind of status flag would seem to me the simplest way for these and many other situations.

Am I thinking about this completely the wrong way? Has anyone else found a way of doing this?

Any help much appreciated

Re: Status Flags

Date :9/27/2001 1:48:40 PM Poster : webmaster@ward.net

We can't show you how to set status flags, because there aren't any in the Indicator Wizard. Some background on the Indicator Wizard may explain why:

When we built the Indicator Wizard we assumed, based on the TradeStation Easy Language model, that people wanting to do programming-like tasks (flags, iteration, etc.) would go to a programming language. We may have been incorrect in this assumption, but anyway we decided to provide standard programming language interfaces instead of our own language (hence the ability to use DLLs in the Trader Pro in C, Basic, and Delphi). Several advisors we had at the time told us that people would feel more comfortable not having to learn a new, non-standard programming language like Easy Language. These advisors may have been wrong, because we've found many non-programmers willing to use Easy Language because they are scared of "real" programming in something like Basic, even though it has always been our opinion that Easy Language is about as hard as making a C DLL.

However, you are right that there are other ways to do these things, which we can show you:

To generate an alert to close a long position, only if I am in a long position (i.e. the last open long position alert was more recent than the last close long position alert):

AND (YourExitCondition, A=B(Position(TradingStrategy, 0), 1))

To determine if a crossabove has occurred in the last x bars:

A=B(Max (CrossAbove(YourTimeSeries#1, YourTimeSeries#2), x), 1)

Combine a series of the above in AND statements to see if a number of crossover signals happened close together.

Sorry, we should have been more precise. Here it is again without the shorthand:

A=B(Maximum Value (Crossover Above(YourTimeSeries#1, YourTimeSeries#2), x), 1)

Maximum Value is in the Basic category. Crossover Above is in Crossover and Breakout Identification category.

On 9/28/2001 3:44:03 AM Mike Oldroyd wrote:
Thanks for this. I will have a look at powerbasic. I was particularly interested about your use of a Max function in the example you give. In my version (Daytrader Pro 3.3) I have Max2, Max3 and Max4 but not a Max function like the one you describe.

Can I get download this function from somewhere? I could see now this function could be useful in lots of ways.

Mike

On 9/27/2001 1:48:40 PM webmaster@ward.net wrote:
We can't show you how to set status flags, because there aren't any in the Indicator Wizard. Some background on the Indicator Wizard may explain why:

When we built the Indicator Wizard we assumed, based on the TradeStation Easy Language model, that people wanting to do programming-like tasks (flags, iteration, etc.) would go to a programming language. We may have been incorrect in this assumption, but anyway we decided to provide standard programming language interfaces instead of our own language (hence the ability to use DLLs in the Trader Pro in C, Basic, and Delphi). Several advisors we had at the time told us that people would feel more comfortable not having to learn a new, non-standard programming language like Easy Language. These advisors may have been wrong, because we've found many non-programmers willing to use Easy Language because they are scared of "real" programming in something like Basic, even though it has always been our opinion that Easy Language is about as hard as making a C DLL.

However, you are right that there are other ways to do these things, which we can show you:

To generate an alert to close a long position, only if I am in a long position (i.e. the last open long position alert was more recent than the last close long position alert):

AND (YourExitCondition, A=B(Position(TradingStrategy, 0), 1))

To determine if a crossabove has occurred in the last x bars:

A=B(Max (CrossAbove(YourTimeSeries#1, YourTimeSeries#2), x), 1)

Combine a series of the above in AND statements to see if a number of crossover signals happened close together.

On 9/25/2001 4:10:40 PM Mike Oldroyd wrote:
In a number of situations, I keep finding myself wanting to set flags or variables, that can then be referred to as parameters for other indicators.

An example would be, I would like to generate an alert to close a long position, only if I am in a long position (ie the last open long position alert was more recent than the last close long position alert).

Another example would be where I would like to trade on a number of crossover signals that happen close together, but not at exactly the same time. With some kind of status flag, I produce an indicator along the lines of "1 if crossabove in the last x bars else 0".

I realise that there could be other ways round both these examples, but being able to set some kind of status flag would seem to me the simplest way for these and many other situations.

Am I thinking about this completely the wrong way? Has anyone else found a way of doing this?

Any help much appreciated

Jurik TPL

Webmaster:
How do we use these TPI files. Sorry if I missed an earlier post discussing this...

Thanx

Re: Jurik TPL

Date :10/1/2001 8:47:43 AM Poster : webmaster@ward.net

The original discussion is in the following thread:

JMA tpl file --- Tagster --- 4/4/2001

Extract the zip file. All .dll files and all .tpl files go in the Template folder of the Trader. When the Trader is brought up again, the indicators show up in the Jurik category. However, note that you have to purchase the indicator DLLs from Jurik to use the interface Victor made. The .cpp and .h files Victor also supplied are the source code files for his interface, in case any of you programmers want to see what he did..

parameters increment

Date :10/5/2001 3:30:35 AM Poster : Claude

Hello everyone,

When I use parameters in prediction or strategies, I sometimes need the kind of parameter which increase 1 at a time. Ex: 1 / 2 / 3 / 4 and I don't mind about 1.1 / 1.2 / 1.3 etc... Is there a possibility to modifiy the increment? Otherwise it lose time for nothing.

Thanks,
Claude

Re: parameters increment

Date :10/5/2001 3:31:54 PM Poster : webmaster@ward.net

The indicators which have integer parameters already take only integer values when optimized, like all the "periods" parameters. So for these, the GA is only examining integer values. For the others, be advised that GAs don't search sequentially increment by increment. They jump all around in the search space, and in fact are searching several places at once. They know nothing of increments. Furthermore, our genetic algorithms are designed to stop searching after a reasonable amount of time passes in which no progress has been made. Therefore, non-integer value searching will only take more time if better results are being found because of searching between integers.

Trailing Stops and Long/Short Exits

Date :10/5/2001 7:22:05 PM Poster : Jana

It looks like I've encoutered another "major" problem with the way NS Trader handles system backtesting.

If I have any trailing or short/long exit stops set they seem to cancel long/short entries.

For example: if I'm long at 100 and I have trailing stop set 1 point below, price goes to 102 where short signal is issued, it won't work. As soon as take out trailing stop, short entry at 102 will work just fine. The exactly same situation happens with using long exit stop in similar situation (it cancels all short entries).

There is anything I should be aware of? Or logic behind is your trailing stop or long exit stop should be hitted before your short entries will become active?

I'd really appreciate any insigt here.

Re: Trailing Stops and Long/Short Exits

Date :10/9/2001 1:26:39 PM Poster : webmaster@ward.net

Normally exits override trailing stops. It sounds like you are doing a reversal strategy and you want the entry reversal to overide the stop. You are correct that the trailing stop overrides the reversal entry as the default. You can accomplish what you want and we will be posting a tip in the Tips and Techniques section today or tomorrow describing how that can be done. Hopefully without sounding defensive though, we would like to disagree with the characterization of such a default as a "major" problem. Many users like the default as it is.

Take for example a trading strategy where you are entering using a technical indicator which occurs quite frequently, but you want to let your profits run using a trailing stop. If the reversal overrode the trailing stop, you would be unable to let your profits run using the trailing stop.

Thank you for your replay. Providing one can do the modeling I've described - I don't have any problems to go one extra step. I didn't want to sound rude or anything and I used word "major" only to point out the fact that one *has* to be able to do modeling described and I was not sure if thats the case. But I definitelly appreciated your prompt attention.

Re: Trailing Stops and Long/Short Exits
Date :10/10/2001 9:12:47 AM Poster : Cantley

The Trader Tip actually makes a good point for something I requested in an email a couple of years ago (when you discuss the difficulty of having the Long Exit and Short Entry rules be the same). You folks said you'd take a look at adding it someday; I wonder if you're still considering it.

It'd be nice to have another "mode" that the optimizer can work in. Rather than optimizing every number that appears in every rule, let me define 2 or 3 variables, and let the GA work on them. I can use those 2 or 3 variables in my rules/indicators/networks, still let the optimizer work, and significantly cut down on my degrees of freedom.

Doable?

Best,
Steve

Your suggestion is often made and we like the idea because although you can now selectively choose what variables to optimize, it requires that you set variables you don't want optimized to a zero range, like 4 to 4. Your idea would make the process easier, although it would arguably not help with the issue at hand, because if you didn't optimize the parameters of entry and exit rules there would probably be little need to optimize at all. Remember the issue in the tip is that optimization will likely result in the same rules becoming different.

We have received many, many good suggestions over the last year or two. Right now our development assets are dedicated to providing alternatives to Quote.com, which accounts for the vast majority of complaints and suggestions we receive. In that regard, we hope to have progress very, very soon. Readers of this site will get our announcements first.

Different Bar Intervals
Date :10/8/2001 1:40:18 PM Poster : MattR

New to the group.....good to see at least *some* source for discussion/support. I have several question but I guess the first is: Is it possible to test/build a trading system that uses indicators based on different bar intervals? I realize that in most cases I can simply change the parameter numbers.....but sometimes it is either much easier or necessary to use a different time frame. For example, if I were predicting price.....

Thanks
Matt

Yes there was.....that's pretty funny.....guess I accidently hit delete with part of the text selected or something.....either that or I am going insane. Could I form predictions on one bar intereval and test trading systems based on another? Could I optimize two different predictions, based on different intervals, and then test systems based on both? I guess that esentially captures the essence of my example.

Thanks
Matt

Re: Different Bar Intervals
Date :10/9/2001 2:04:48 PM Poster : albertl

Hello Matt, hello Maxwell,
There has been a thread about this already, the suggestion was, as far as I remember to use 5 identical daily values , stemming from each weekly bar.

My suggestions:
use moving averages , start with period 2 or 3 to avoid too much lag, use
them on open, high, low, close,volume as needed, build your indicators from there, or even better:
use maximum of last 3 days for high, minimum of last 3 days for low, close for close etc...and have your 3 day bars like that.
I cannot see any reason why you should not mix these different interval bars
in your predictions, after all it is very common to do so with MA s.
Same models but based on different interval bars will very likely need retraining.
Minute bars would probably need different inputs/ models also compared to daily bars , same dayly versus weekly. Except may be moving average models which might be more tolerant to interval changes I guess...
Hope many friends will join the discussion
albert

Re: Different Bar Intervals

Date :10/9/2001 4:08:26 PM Poster : Maxwell Craven

In addition to what Albert said, if you change the frequency on the chart, all the predictions will be automatically updated to the new interval. I use it all the time; works pretty nicely.

Currency predictions

Date :10/9/2001 2:30:52 PM Poster : albertl

Hello all,
Can anybody be so kind and give me any example/hint what indicators to use for currency predictions, both daily and intraday. I am presently using dayly and intraday bars in my daily NStrader .

Can anybody recommend a specific add on (WARD,JURIK ?) which is definitely improving the predictions. My best results on minute bars have been till now with adaptive MA s., and MESA to a lesser extent., I do not have much success with momentum models.
Thanks in advance
albert

ps I have been told by support to submit this to the forum

Re: Currency predictions

Date :10/17/2001 9:10:28 AM Poster : Maxwell Craven

I own all but one or two Ward addon programs and have found they often improved all types of trading systems I have built, but I haven't attempted currencies yet. My favorite is the clustering addon.

I think you'll find that the indicators change over time. For stocks, the price-momentum indicators are always a good starting place. I always narrow the inputs down to a few and then try clustering on the group of inputs as entry/exit signals. Recently I had some particular companies began showing up with the MESA indicators also.

The markets change, and a different set of indicators may be called for after a significant economic or legal upheaval. For instance, if Congress changes the laws for market makers or the tax laws change, the market itself will change to compensate.

On average, I tune the networks every 3-6 months to see if the indicators can be improved; more often if the underlying systems begin showing large error rates.

Re: Currency predictions

Date :10/17/2001 5:12:53 PM Poster : albertl

Thanks very much for your comments, Maxwell and Michael,

,May be I should try the add ons, starting with the clusters, which might help also with the following:

Before I upgraded to the NSprof I thought I had been doing a lot of test work and had found good systems,...only to notice that optimizing was not less work.
I furthermore got a nice chock when I noticed that optimizing , mainly when selecting the best input variables , did not at all bring the same results as those I had found previously.
Changing test periods and walkforward length continues to influence most heavily the choice of the systems..

If anybody wants to unleash his add ons on currencies, here the URL giving free forex minute bars , since january 2001 !!!

May be some results could kindly find their way to the forum ...?

On average, I tune the networks every 3-6 months to see if the indicators can be improved; more often if the underlying systems begin showing large error rates.

Hello all,
Can anybody be so kind and give me any example/hint what indicators to use for currency predictions, both daily and intraday. I am presently using dayly and intraday bars in my daily NStrader .

Can anybody recommend a specific add on (WARD,JURIK ?) which is definitely improving the predictions. My best results on minute bars have been till now with adaptive MA s., and MESA to a lesser extent., I do not have much success with momentum models.
Thanks in advance
albert

The Jurik MA TPL does not work . Why ?

Re: Jurik

Date :10/16/2001 2:59:55 PM Poster : Texas Bubba

Ole buddy, I bet you got the same problem I had. I finally realized that what's on this forum is just an interface. I actually had to purchase the underlying indicator from Jurik. Imagine that! Is that your problem?

Note to Victor Chu:

Hi Victor,

Just thought I'd let you (and the other members of the group) know that I have been able to get NST Prof to call Jurik's JMA,VEL,RSX & CFB dll's directly without having to use an interface dll to call them. Jurik's support replied with the following when I asked them about your "DWord" concerns.

>My programmer sent me this response...
>----------
>Using DWORD (unsigned integer) may or may not be a problem. If NS allows the unsigned int type, then no problem at all. They're the same. If it only allows signed INT, there would only be a problem if the integer was greater than 2 billion. Signed integers would interpret that as a negative value.

>I'm not sure the extra DLL is needed. I don't get why returning the raw data for the first 30 bars should be a problem.
>----------

All one has to do, when they require a "DWORD" type parameter, is to declare it as "By Val Long (long)".

(It's not so simple as this though with the WAV & DDR because of their array requirements.)

Cheers, Garth

Hello,

You can certainly call Jurik's Indicator directly from NST. The main purpose of my DLL which calls Jurik's DLL is to filter out the first twenty or so values which are not part of the indicator. This can be useful in some ways. First, those values should not be displayed on the chart. Secondly, when you insert Jurik's Indicators into other indicators, you can be sure that the resulting values will be affected by the initial values.

Thank you
Victor Chu

Hello,

First, I'd like to thank Victor for the interface dll. It allowed me to start experimenting with 2 of 3 recently purchased Jurik indicators, JMA and VEL. I can't seem to figure out how to get RSX to link up though - it doesn't show up as a callable procedure as the others even though it's indicated as such in the nt_jind.cpp file. Any suggestions?
And a question to Garth: I could really use an example of parameters used for a direct call of any one of these three indicators. My attempts at creating an appropriate .tpl directly have not worked at all - the variations I've tried have literally killed my NST program.

Regards,
Matt

Hi Matt,

I've sent a copy of the Jurik TPL's and a word document discribing all the parameters settings I used to create them, to Webmaster. I hope they are of help to you.

Please note that when you set up a chart to use them, set the starting date of any system testing/prediction training etc. that you are going to do, to be some time after the beginning of the chart. So as to allow enough bars at the begin for the indicators to create "True Readings" eg JMA needs 30 bars to give true reading, CFB.192 needs 192 bars to create 1st reading.

Cheers,
Garth (Australia)

The Jurik DLLs are commercial products of Jurik Research, so you have to purchase them from Jurik. What Victor, Garth, and perhaps others are contributing here are only the interfaces (.tpl files) which enable these DLLS to be run from NeuroShell instead of TradeStation for which they were originally designed.

wavelet
Date :10/12/2001 2:16:15 AM Poster : Sylvain Gauthier

Any sucess with wavelets ?

NST allows the user to optimize different objective functions but only if the inputs are optimized. What if the inputs are not optimized: we loose that capability.

The optimal target (optimal % change etc...) has not been defined. How is it computed and optimized.

Re: wavelet
Date :12/5/2001 3:54:08 AM Poster : Richard Nowak

"A family of wavelets are derived, based on LaGuerre polynomials. While these wavelets are useful for data compression by describing the waveform in terms of LaGuerre Polynomial coefficients, it is shown that they are not useful for trading because the delay factors preclude any predictive capability. If one can generalize, the implication is that all wavelets are not useful for trading." John Ehlers, check his web site: http://www.mesasoftware.com/pub/index.html

I have great respect for John Ehlers, and he could right about LaGuerre polynomials. But with regard to generalizing to other wavelets, here's something for whatever it is worth: at least two of our users have shown me some pretty profitable charts done with the HAAR wavelet that Victor Chu donated to this forum some time ago.

After reading Steve's post I decided to take a look at the HAAR wavelet that Victor Chu donated to the forum a while back. I had played with various wavelets (including MESA) about a year ago, and my results were less than satisfactory.

However, I'll have to second Steve's comments on the HAAR. This thing works like no other wavelet I've tried in the past. Used properly and within reason, the potential to produce profitable charts is huge. It's an awesome tool - and I thank Mr. Chu for taking the time to prepare and provide it to the forum.

Yes I agree, Bruno and Victor have indeed contributed much to this area of discussion particularly from a coding perspective.

Additionally, Professor Ffion Murtagh (as Victor will confirm) has taken this "humble" indicator to a much higher level. For those interested, please review his material on:

http://www.multiresolution.com

For the mathematically inclined there is much to be gained from wavelets...

regards,

Daniel P Lyons

Re: wavelet
Date :12/6/2001 11:15:52 AM Poster : Daniel P Lyons

In my experience, many problems associated with wavelets involve inadequate ways of handling end effects, i.e. data boundary effects. This is usually related to the selection of some arbitary frequency as the "ideal" input solution.

There are methods available for properly handling the important "boundary properties" at the end of data. Such techniques (in my experience) do allow effective implementation of wavelets as part of a trading strategy and/or as inputs to predictive nets.

Like most successful methodologies, however, they are not used in isolation.

Daniel P Lyons

Indeed, that HAAR wavelet eliminates boundary problems on the right side of the data.

Any sucess with wavelets ?

NST allows the user to optimize different objective functions but only if the inputs are optimized. What if the inputs are not optimized: we loose that capability.

The optimal target (optimal % change etc...) has not been defined. How is it computed and optimized.

Re: wavelet
Date :10/12/2001 9:53:38 AM Poster : Xprogrammer

The optimal change definitions are in the help file under Neural Network - Output Discussion. There's a pointer to that in the context sensitive help that shows up if you push the help button at the place where you can select your output. I also found something about them in the Changes in Versions of NeuroShell Trader book under the place called Changes from 3.0 to 3.2.

As a former programmer myself I actually think the Ward group has done a pretty decent job in their context sensitive help. You can pretty well find most things. The other neat thing Ward did is that if you go to the Help menu and select Search for help on..., all you have to do is press on the Find tab and type in the word optimal. Then all the places where optimal appears show up right away in a list.

Back in the old COBOL and FORTRAN days if you didn't find it in the index of a huge manual, you were out of luck. I sure wish we'd had context sensitive help capability back then! It wouldn't have been much good in the days when we used card decks, but later we went to online terminals and we could have used it if IBM had put in in the mainframe operating systems.

Quote.com problems today
Date :10/22/2001 1:49:30 PM Poster : webmaster@ward.net

Quote.com is having problems today, but if you go to www.quote.com and click on the "Click Here for Network Updates" jump (left side, down about half way) you can read all about them. Whenever you have problems concerning Quote.com, it might be a good idea to check their web page to see if anything unusual is happening.

Custom Indicators
Date :10/23/2001 10:03:17 PM Poster : jaj

In setting up a custom indicator for the McClellan Oscillator I am able to fix the day parameter's (19 & 39) permanently, but the NYSE advance and decline parameters (*naz & *ndz) must be re-designated each time the indicator is to be used. Is there a way to set up a custom indicator in NSP so re-designation of the intruments won't be necessary? Thanks.

Re: Custom Indicators
Date :10/24/2001 1:44:19 PM Poster : webmaster@ward.net

No, there is no way to default a parameter to a particular instrument in a custom indicator. However, what you could do is insert that indicator in a chart, and then refer to the inserted indicator each time you need it in that chart. That won't help you with other charts, but may cut down on keystrokes, especially if you decide to add lots of chart pages using "add/remove chart pages".

Quote.com / Qfeed
Date :10/26/2001 4:39:25 AM Poster : Mike Oldroyd

Is Ward systems looking at any alternatives to quote.com? We have had to cope with a regular stream of outages and incorrect data recently, and the level of customer service from their staff is abysmal.

I notice that quote.com want to charge NYSE "Data vendor" fees to anyone who develops software on their feeds. At the moment it's just the users of their own SDK (including yourselves I guess) but if this charge holds, maybe they'll want to start charging anyone who develops their own indicators. I don't really want to start forking out $750 a month because I have a few powerbasic indicators.

Any views on this?

Re: Quote.com / Qfeed
Date :10/26/2001 4:12:16 PM Poster : webmaster@ward.net

Yes we are working on several alternatives to Quote.com. We hope real soon to be announcing something about one of them. However, we hope nobody is expecting some other feed to be totally without problems. It may boil down to which feed has the least number of things that irritate you. The main advantage now of Quote.com is the huge amount of historical data they have. We haven't found nearly as much elsewhere. Other sources may offer more reliability but less historical data, or you may have to leave your computer on and collect that data because they don't supply it at all. Other feeds may have some problems similar to some of Quote.com's.

We can't imagine our users ever being charged developer fees because you build indicators. If you SELL those indicators then maybe it could come to that, who knows.

Re: Quote.com / Qfeed
Date :10/28/2001 8:30:00 AM Poster : Maxwell Craven

I agree that it is nice to get all that historical data. Others don't seem to have more than about a month of historical. However, I am a little worried that Quote.com may have done what they threatened to do some time ago - give the lowest priority to those downloading historical data. Even though it is Sunday morning, it is taking forever to get historical data. Same thing yesterday but not nearly ad bad. I even use the pinger thing that you provided. In honesty though I have no way of knowing if the slow speed is quote.com, the internet, or my isp. Anybody else have this problem this weekend?

Yes, we are continuing to look at TS Pro along with other alternatives simultaneously. We can't really report any status for that until we call for beta testers. All we can say at this point is that we will be beta testing the M3 market data server first (there is a paragraph on that in our Oct email newsletter due out tomorrow).

Downloading intra-day

Date :10/31/2001 10:36:24 PM Poster : Tagster

Hi all,

Been out of the loop, trading longer term from TS2000 while working on other things. I was using Quote.com real time (Choppy).

I would like to download the last few months of tick data without signing up for a service just yet. Can I get downloads by purchasing tick data online?
What would be recomended? Any ideas. Can I switch back to global server?
That might work?

Thanks,

Tagster
Thanks

Re: Downloading intra-day

Date :12/26/2001 1:27:18 AM Poster : Bruno

Why don't you just download delayed tick data from the free Omega FTP site?
But as you know using GS with NSDT is not quite risk free. I have had a few crashes, particularly when attempting to change the chart frequency.

Bruno

UMDS

Date :11/1/2001 1:08:37 AM Poster : CBOTDOC

TRADESTATION 6 (ASP) IS NOW BASED ON UMDS AND IT'S THE FIRST STABLE SERVER TS HAS HAD. HAVING IT AVAILABLE FOR THE DAYTRADER PRO WOULD BE EXCELLENT.

JURIK TURNING POINT

Date :11/5/2001 4:27:54 AM Poster : ED CONDON

MAY I HAVE ANY FEEDBACK ON THE JURIK PRODUCTS? ESPECIALLY THE TURNING POINT PRODUCT.....I AM PONDERING THEIR PURCHASAE...ARE THEY WORTH IT? MONEY? AND LEARNING CURVE?

Re: JURIK TURNING POINT

Date :11/6/2001 4:22:57 AM Poster : Daniel P Lyons

Hi Ed,

I came across this comment on the Jurik forum:

//////
I tried TPO for a while. I would just as soon use RSX. It didn't
seem to provide signals any sooner than anything else. The best
settings I found were the ones recommended by the author. M advice,
save your $$ and tune your RSX to meet your needs.
///////

I have used the Jurik Indicators and found them to be interesting from a learning perspective but I don't use any of them in my final trading strategies. They help me understand price action in a "cleaner" way in order to define/refine indicators and strategies etc. But like most things you have to experiment to get the best from them.

I hope this helps,

Daniel

Re: prediction

Date :11/29/2001 2:57:56 AM Poster : claude

Hello Albert,

Sorry, I realise that my question is not so clear. I'd like to make a prediction of 1 bar in the future, the indicator to predict is made of
% change in close on 5 bars (not days).

To summarize:
- Output: Prediction of "1 bar in the future", for an indicator made of "% change in close on 5 bars",
- Input: Several indicators (5 to 20 bars in the past) made of momentum, regression, % change, fuzzy ...
- Not trading position, look for minimize errors

The mean error I get is between 0.15 and 0.20 which seems to be good, but I am wondering if I am overfitting or not.

Claude

Fitness function

Date :11/13/2001 1:53:31 AM Poster : Jana

Hi,
I would imagine this is another suggestion for NS Trader developers.
While building neural nets or optimizing something using GA quite often I find myself in situation where I'd like to use my own (customized) fitness function rather than have to choose from the list provided.
For example I may want search for parameters to maximize function f = net profit * number of trades /average trade span (just an example).
In my eyes its not just a minor improvement but rather essiantial feature to have to take full advantage of neural nets and GA. Best of all it should be really easy to implement too, basically you just have allow user to define his/her own fitness functions and I can't think of any reasons why this would hurt anyway.
Your feedback would be appreciated.
Thanks,
Jana

Re: Fitness function

Date :11/20/2001 3:14:13 PM Poster : alberl

Hello Jana,
I have read your post again and I realized only now that you have touched

the subject which is bothering many of us: the far too uncontrolable
trade intervals:
Your suggestion will be very useful to optimize / reduce the intervals,
so I strongly vote for your suggestion,
may be others would join, and WSystems might
consider helping faster in this respect.
albert

Re: Fitness function

Date :11/22/2001 10:40:05 AM Poster : webmaster@ward.net

We certainly share the view that user-created fitness functions are a good idea, as well as being able to constrain optimization for the purpose of adjusting trade intervals and other things. Basically, the fitness would be penalized if it traded too much or too little. Both of these are on our "to do list".

In the mean time, read the tip on this site called "What to Do if Your Optimized Trading Strategy Trades Too Much". There is already an excellent way to penalize fitness for too much trading that seems to work for most users, assuming that trading rules or net inputs being optimized can cooperate. If it doesn't work consider constraining parameters in your indicators, or revisiting what your trading rules do.

Re: Fitness function

Date :11/24/2001 1:58:37 AM Poster : Jana

I truly appreciate the responsiveness and cooperation by developers.
I didn't particulary meant trading intervals, it could be virtually any function one want to optimize, so its more general.
Different issue is being able define variables and use them as parameters for GA optimization - I assume developers are working on this too.
These 2 are definitelly the highest priority on my list, the rest could be taken care using dll pretty easely.
I may have few other neat ideas how to improve NS Trader even further, but they are not that simple so I'll hold on them for now.
For now I'm trying to only suggest upgrades which are in my opinion vital for truly "professional" trading package.

Different Bar Intervals

Date :11/15/2001 7:15:43 AM Poster : Mike Oldroyd

I would really want to go a step further than that, and be able to use different bar intervals within the same indicator. For example, many people reagard the 200day SMA line as a major resistance/support line. I would like to be able to factor this in, even when short term trading with other indicators using 1 or 5 minute bars. Multiplying up more frequent bars, just isn't the same since the support/resistance is at least in part a self-fulfilling prophecy, and an average of a very large number of minute by minute figures won't give you the same graph.

Re: Different Bar Intervals

Date :11/17/2001 2:50:47 PM Poster : albert stoffel

Hello Mike,

I absolutely share your desire as I am convinced that having for ex. 1 min and 15 min bars in the same prediction will boost the reliability of the nets.

If you were not so "demanding" by wanting to have a 200 day MA in a one minute chart, but only 15 min bars (1 min versus 200 times 7 hous times 60 min), you could try the following...
(I have tried it on 1 min historical data transformed via EXCEL into daily bars:...and looked at it with the daily NST)

Say you are in a 1 Minute chart and want to have 15 minute bars.
The information contained in a 15 min bar is:
OPEN 15 = LAG 15 of OPEN 1min
HIGH 15= Highest HIGH window 15 of 1min bars
LOW 15= Lowest LOW window 15 of 1 min bars
CLOSE 15 = CLOSE 1min (more or less)

These data series contain nearly the same info as real 15 min bars
I would even say that they yield better results in predictions than
simple 15 min bars as the latter are less continuous i.e. come in only every 15
minutes.
These data obviously are Kellner channel data ! ! ! and as such more sophisticated than simple bars as they contain more information, they look very nice on the chart!
If you want to loose that supplemental info and get the real bars, you would have to filter out 14 of 15 bars. I have not one this though.

However I believe Ward Systems will do the necessary sooner or later and in the mean time somebody of our dll specialists will do it before. (If not me)

Re: Different Bar Intervals

Date :11/22/2001 4:20:46 AM Poster : Mike Oldroyd

Thank you Albert. That sounds like a great idea. I adapted your idea slightly and found I could get the 200 day SMA on a 30 min chart, by using the Intraday DayClose indicator. ie on a 30 min chart.

200 day SMA = Avg(DayClose(Date,Close,1),2800)

(2800 becuase there are 14 30 min bars in a day)

Mike

Protective Stops

Date :11/20/2001 9:09:47 AM Poster : maciej

When training I usually run my ideas without any protective stops and if the results seem interesting then I retrain using exactly the same rules/data (daily) with protective stops based on points allowing the optimiser to find a suitable stop value.
Logically I'd expect to get the same or more number of trades; the stops shouldn't prevent mne from trading but I'd be stopped out perhaps. What happens is that the number of trades in the training drop dramatically.
Does anyone have an explanation for this?

DataX

Date :11/21/2001 8:16:38 PM Poster : Steve Kratochvil

I have been very pleased with my uses of this fine add-on it is currently employed to send signals in my AutoPilot program. Conversely, it is almost better to use it to send data back to the NSDTP. I can see that it may be of interest to be explored by anyone trying to add the different time sequences into an existing chart. With the DataX you could send the current 15min bar data into a 1min chart or you could use a dll. This brings up something that I forgot to mention. This digression got to be large enough for another post see "Visual Basic DLL"

Steve

Did you ever get round to posting your thoughts Visual Basic DLLs? I would certainly be interested.

Mike

Sounds very interesting! What exactly is your AutoPilot program?
If I understand you correctly, you inter-feed charts with PutData-GetData. Does they synchronize ok?

Bruno

(By the way, I have written 2 small "DataX for Excel" which can be of interest to non-VB programmers.)

> If you built a system so that a 15min chart PutData indicator of CLOSE was put out to a DataX file (#1) that was monitored by an Application that would collect that data and then PutData of CLOSE out to a DataX file (#2) that a 1min chart was watching with GetData you might have it. I have not explored this yet mostly because I do not see the value in the multiple time series.

clean desktop, order and clear head

Date :11/26/2001 4:26:54 PM Poster : alberl

Hello
This is a call for help on down to earth practical work organization !

I am submerged by the multitude of my predictions.
How should I organize myself now, I am badly suffering from information overflow.
Having multiple folders does no more help, has anybody work a nice and practical classifying system which he would be prepared to share ?

I would also need to be able to import predictions from one prediction to the other, via copy and paste , or drag and drop , is this on the to do list by WS ?
thx in advance
albert

train up to today and then look back without retraining

Date :11/26/2001 4:43:10 PM Poster : alberl

Hi again,

Would it not be nice to train and optimize on data, say of the last 6 month , and then to be easily able to look back at any previous period , say of 3 month, in previous past?

with the same net, without the NST trying to retrain?
.

Use A>B and A<B in your trading strategy rules, where A is either the current net or one of your walk forward nets. I don't think you can use the out of sample net, but then you don't need to anyway. You may have to go to options to make sure the current net and walk forward nets show up.

(LOOKING AT the out of sample data THRU THE EYES OF MY MOST RECENTLY TRAINED NET)to see how my most recently trained net works on the tree months before the recent 1 year training period.or any other previuos period)
This is in my eyes better than doing it the usual " classical" way , where the out of samole period is the most recent period
I believe this would be dynamite on intraday data
Worth considering it from the standpoint of patent law ?.. But there are so many ideas around..
I would call this backward out of sample testing

Trading Strategy thoughts
Date :11/26/2001 7:31:06 PM Poster : Steve Kratochvil

I just made one of my own personal bonehead mistakes that turned into an awesome discovery after I sat and stared at my mistake for about 3 hours. This is what I have to offer all who work hard to hone their trading systems. Ever feel like you cannot get anything to work out right. Try this. Before you go building the Holy Grail of predictions why not get your Trading Strategy locked down tight just as if you had the perfect prediction signal. This way you only need to solve for predictions not both predictions and trading strategy. I have found that I make adjustments to both in an effort to get the total performance up. This often makes the bad prediction look better than it is or the trading strategy never seems to hit dead center even with fine adjustments.
This is what I did. Take your FuzzyGA7 and build a fully optimized prediction with it. Now make the classic mistake of using the ActualSignal of the FuzzyGA7 as the input into a Trading Strategy. Presto you have an absolutely perfect signal to develop a perfect Trading Strategy. I was not paying attention to the fact that I was using this non-tradable ActualSignal because I had renamed it FuzzyGA7Signal which is a real bad name for that signal anyway. I went about my business with 186 wins out of 188 trades not realizing my debacle. I fired up my AutoPilot at 7:30am and left it to trade the day away as I was out and about. I was so excited when I cam home that I rushed down to see what had happened. Nothing. Not one single trade was executed. I though what did I do wrong? I checked everything. The DataX had not sent over a signal all day and my AutoPilot was just sitting there ready as ever. I looked and the trade signals were 10mins behind the current bar. I realized that the DataX was getting a 0 on every bar as the Trading Strategy was 10mins behind the input. But the trades being pegged, on the current live data, were perfect. I was stymied. I had perfect trades only 10mins behind the action. Then I figured it out. I had even called Ward Systems to explain my problem. Then after awhile I started to realize that I had the perfect set of rules for my trading style no matter what the prediction. So I ran the same system on other stocks and they too traded perfectly. I was back to elated and smiles. I also could see that I only needed build any prediction to mirror the ActualSignal. This is just a thought about the possibility of eliminating at least the trading strategy variable from your trading system.

Hardware Thoughts
Date :11/28/2001 9:44:33 PM Poster : Steve Kratochvil

I have some definitive information about the Hardware you should be using for the Neural Shell Day Trader Professional. If you are working with intra day data and are day trading then speed and power are as important to you as the accuracy of your system. The reasoning here is, "If you can't execute on time it does not matter if your right." I have used the NST one four different machines just because I have them. This is what I have noticed. On slower 600mhz machines you will need 512mb ram. On a average 1ghz machine you will need 256mb ram. The speed of the CPU directly affects the amount of ram you will need to be functionally acceptable for real trading. Now the latest machine that I have purchased for my NST is a 2ghz CPU with 512mb of RDRAM and a 7200rpm 40gig HD. I had the machine custom built to my specifications. Let me just say the being able to fully optimize a single net in 30 sec was exciting. Buy the best and most powerful machine made, even if it means a second mortgage. You cannot compromise on the Hardware, NST will eat it up.

Re: Hardware Thoughts
Date :11/29/2001 1:11:05 PM Poster : alberl

Hello Steve,
But how many predictions at say 5 inputs and 1000 bars are you using
in one net?
My NST s limit is reached ,for a 600Mhz 200Megabyte AMD, when I use 2 predictions as input to a final prediction and 6 times 3000 bars as inputs total
albert

It sounds like something must be wrong with your system, unless you are using more than a few walkforwards. How many WFs? Anything else in your chart, maybe hidden stuff? I do know that Microsoft takes about 100 megs for the OS, and you may want to check to see if any other programs are getting started automatically by the OS. What indication are you getting that the limit is reached?

I was just as interested in maxing the machine out as you would be. I have found that increases in hardware give proportiaonal increases in NeuralShell. I was really wanting to try out the new technology (Pentium 4, WinXP Pro, RAMBUS Ram) on NeuralShell and I got it a bargan price so I was happy. This is what I did just from a performance stand point. I took 197 inputs and 1300+ bars of one minute intraday data and let it fully optimize a prediction. It took 1hour and 10minutes on the new machine. When sat down to running just the real things that i am wanting to test having the increased hardware made it very nice to run through things only waiting mabye 1 or 2 mins when I reduced the number of inputs to 2 or 3 etc....

If you are looking at hardware to buy. Just do it. I can give you the specs that I gave to my builder.

Steve

M3
Date :11/30/2001 10:29:42 AM Poster : Ergo Mann

A short while ago, 14 May 2001, you wrote an email to all users in which it was stated,

{"We have been hearing quite a few complaints about Quote.com lately; it seems they have been having their problems. Mostly people want to know if we are in the process of trying to support other real time data feeds. In this article we will outline what we are doing, and what you can do in the meanwhile to make life with Quote.com easier.
First of all, let us reiterate why we chose Quote.com to begin with. We aren't trying to make excuses for them, but they were the only intraday data service that could deliver a reasonable amount of historical intraday bars over the feed. You have to have historical data to build neural nets and also to backtest traditional trading strategies. It's that simple.
TradeStation Pro can do it, but they aren't a data service. There may be other outfits like TradeStation that deliver this data as part of some software they sell, but as far as we know, Quote.com is the only data service.
At this time, we are working hard to support UMDS, the Universal Market Data Server [now M3] (www.uniserv.com <http://www.uniserv.com>). When we complete this effort, you should have a number of other satellite and cable data feeds available to you. The problem of historical data, however, will remain. You are going to have to leave UMDS on for a while to collect historical data, or you will have to get it somewhere else, like Tick Data, or Quote.com. It also may be a while before UMDS supports internet feeds.
As a TradeStation provider, we are also trying to be able to provide you with TradeStation Pro's intraday data. TradeStation is not going to make this easy for us as they are not providing any means for 3rd parties to link to their data server at this time. However, we are exploring other means of extracting the TradeStation Pro data. This will be a good solution for those who already own or plan to own TradeStation Pro.
As part of the two efforts above, we are also planning to provide some sort of Data Input API in the NeuroShell Trader. This will let those of you who have some programming capability fire intraday data into the Trader from any source to which you have programming access.
Now, what can you do in the meanwhile?"}

Of specific interest is the part about the Data Input API. Being in the UK is it somewhat awkward to get the data feeds associated with securities I trade, namely, the FT-SE 100 index, CAC and DAX 30 indicies. I also trade the DJIA and S&P 500 indices.

I therefore use a DDE feed from the trading platform, Market Master and feed that via a database to a CSV file which I then open in NeuroShell DayTrader Professional.
Although this works it is clearly limited and is usually a minute behind the market. I have to manually open and close files to get NST to update the chart.

What I would like to know is are you still planning to expose the API in NeuroShell Trader or do you intend for users to opt for the M3 solution with the SDK for such non standard feeds?

Thanks

Ergo

We are still looking at building an API to enable intraday data to be input into the DayTrader. We are also looking at intraday data feeds that have European Exchange Data. We can't be more specific than that at this time.

Webmaster,

Thanks for your response.

I wonder then if you could offer me some advice.

I am exploring the option of M3 Data Server with the SDK, the full version of which will not be available until next year.

However, my situation is a bit desperate. I have a very good model of the S&P which I trade using the kludge method I described, namely, I use a VB5 client to read a DDE feed and pass to a database on another computer the high low. At the end of each minute it performs a series of queries that forms the high, low, open and close for a list of securities (six, mainly indices) and then uses an ActiveX control to append the high, low etc., to a CSV file that I open and re-open (to get the update) in NST.

The advise I seek is how or what method you would use to wholly automate this process? So that I no longer suffer from the lag of at least one minute which can prove critical and confines me to looking at only a handful of securities.

Any advice will be gratefully received.
Thanks again in advance.

Ergo.

A short while ago, 14 May 2001, you wrote an email to all users in which it was stated,

{"We have been hearing quite a few complaints about Quote.com lately; it seems they have been having their problems. Mostly people want to know if we are in the process of trying to support other real time data feeds. In this article we will outline what we are doing, and what you can do in the meanwhile to make life with Quote.com easier.
First of all, let us reiterate why we chose Quote.com to begin with. We aren't trying to make excuses for them, but they were the only intraday data service that could deliver a reasonable amount of historical intraday bars over the feed. You have to have historical data to build neural nets and also to backtest traditional trading strategies. It's that simple.
TradeStation Pro can do it, but they aren't a data service. There may be other outfits like TradeStation that deliver this data as part of some software they sell, but as far as we know, Quote.com is the only data service.
At this time, we are working hard to support UMDS, the Universal Market Data Server [now M3] (www.uniserv.com <http://www.uniserv.com>). When we complete this effort, you should have a number of other satellite and cable data feeds available to you. The problem of historical data, however, will remain. You are going to have to leave UMDS on for a while to collect historical data, or you will have to get it somewhere else, like Tick Data, or Quote.com. It also may be a while before UMDS supports internet feeds.
As a TradeStation provider, we are also trying to be able to provide you with TradeStation Pro's intraday data. TradeStation is not going to make this easy for us as they are not providing any means for 3rd parties to link to their data server at this time. However, we are exploring other means of extracting the TradeStation Pro data. This will be a good solution for those who already own or plan to own TradeStation Pro.
As part of the two efforts above, we are also planning to provide some sort of Data Input API in the NeuroShell Trader. This will let those of you who have some programming capability fire intraday data into the Trader from any source to which you have programming access.

Now, what can you do in the meanwhile?"}

Of specific interest is the part about the Data Input API. Being in the UK is it somewhat awkward to get the data feeds associated with securities I trade, namely, the FT-SE 100 index, CAC and DAX 30 indicies. I also trade the DJIA and S&P 500 indices.

I therefore use a DDE feed from the trading platform, Market Master and feed that via a database to a CSV file which I then open in NeuroShell DayTrader Professional.
Although this works it is clearly limited and is usually a minute behind the market. I have to manually open and close files to get NST to update the chart.

What I would like to know is are you still planning to expose the API in NeuroShell Trader or do you intend for users to opt for the M3 solution with the SDK for such non standard feeds?

Thanks

Ergo

We didn't understand your comment about M3 - we assume you are saying that M3 won't interface with your feed until next year. We also assume you could use either M3 or Quote.com for your S&P model. So in terms of the European exchanges, your problem won't really be solved until you can beta test something we build that will either give you an API to load in data, or give you access to European exchanges. However, as an interim all we can suggest are the macros recommended by Mr. Buffalo on the Tips from Trader Users section of this site. They may be able to close down the DayTrader, bring it back, and load your chart faster than you can do it manually.

Webmaster,

Thanks for your response.

I wonder then if you could offer me some advice.

I am exploring the option of M3 Data Server with the SDK, the full version of which will not be available until next year.

However, my situation is a bit desperate. I have a very good model of the S&P which I trade using the kludge method I described, namely, I use a VB5 client to read a DDE feed and pass to a database on another computer the high low. At the end of each minute it performs a series of queries that forms the high, low, open and close for a list of securities (six, mainly indices) and then uses an ActiveX control to append the high, low etc., to a CSV file that I open and re-open (to get the update) in NST.

The advise I seek is how or what method you would use to wholly automate this process? So that I no longer suffer from the lag of at least one minute which can prove critical and confines me to looking at only a handful of securities.

Any advice will be gratefully received.
Thanks again in advance.

Ergo.

Gentlemen,

If you're looking for European exchanges then you could use DialData. I use AIQ/TrackData which amounts to the same thing for European EOD data. Its reasonable though the quality of the data is sometimes an issue.

Regards

We now note that S&P Comstock not only has European and Asian exchanges, but offers those services via satellite in Europe and Asia as well. So if you or others are willing to access via satellite, you can discuss the issues with them at the European and Asian sales offices. See www.spcomstock.com for details and sales office numbers.

Date :12/19/2001 4:24:33 PM Poster : Ergo Mann

Webmaster,

Many thanks. I have already down loaded the M3 and v3.5 of NST though I should sign up for the beta test too.

I saw that the M3 has a DDE option which is not enabled on the trial (single use) version. So I decided I should just pay for the full $995 version and see if I can 'tweak' it to work.

I will also contact Comstock as indicated.

However, I am becoming contented just to trade the S&P 500 as it has proved quite lucrative even with the pseudo automated method I use. Once I finally get to full automation I will be able to short as well as go long which is mainly the strategy I employ now.

Ergo.

Date :12/20/2001 9:52:57 AM Poster : Webmaster@ward.net

We should point out to others that M3 is free in the single user version and is not a trial version. You only need to pay for more advanced things. Here is their pricing statement from www.mktstream.com:

Pricing:

Stand-alone versions of the M3 Market Data Server for individual Traders
Free Version (Single application use only, Supports many broadcast feeds)

Standard Version ($595 - Allows multiple applications, DDE, and data import/export)

Pro Version ($995 - Allows multiple feed drivers, record/playback and other advanced services)

On 12/19/2001 4:24:33 PM Ergo Mann wrote:
Webmaster,

Many thanks. I have already down loaded the M3 and v3.5 of NST though I should sign up for the beta test too.

I saw that the M3 has a DDE option which is not enabled on the trial (single use) version. So I decided I should just pay for the full $995 version and see if I can 'tweak' it to work.

I will also contact Comstock as indicated.

However, I am becoming contented just to trade the S&P 500 as it has proved quite lucrative even with the pseudo automated method I use. Once I finally get to full automation I will be able to short as well as go long which is mainly the strategy I employ now.

We didn't understand your comment about M3 - we assume you are saying that M3 won't interface with your feed until next year. We also assume you could use either M3 or Quote.com for your S&P model. So in terms of the European exchanges, your problem won't really be solved until you can beta test something we build that will either give you an API to load in data, or give you access to European exchanges. However, as an interim all we can suggest are the macros recommended by Mr. Buffalo on the Tips from Trader Users section of this site. They may be able to close down the DayTrader, bring it back, and load your chart faster than you can do it manually.

On 12/9/2001 2:33:29 PM Ergo Mann wrote:
Webmaster,

Thanks for your response.

I wonder then if you could offer me some advice.

I am exploring the option of M3 Data Server with the SDK, the full version of which will not be available until next year.

However, my situation is a bit desperate. I have a very good model of the S&P which I trade using the kludge method I described, namely, I use a VB5 client to read a DDE feed and pass to a database on another computer the high low. At the end of each minute it performs a series of queries that forms the high, low, open and close for a list of securities (six, mainly indices) and then uses an ActiveX control to append the high, low etc., to a CSV file that I open and re-open (to get the update) in NST.

The advise I seek is how or what method you would use to wholly automate this process? So that I no longer suffer from the lag of at least one minute which can prove critical and confines me to looking at only a handful of securities.

Any advice will be gratefully received.
Thanks again in advance.

A short while ago, 14 May 2001, you wrote an email to all users in which it was stated,

{"We have been hearing quite a few complaints about Quote.com lately; it seems they have been having their problems. Mostly people want to know if we are in the process of trying to support other real time data feeds. In this article we will outline what we are doing, and what you can do in the meanwhile to make life with Quote.com easier.
First of all, let us reiterate why we chose Quote.com to begin with. We aren't trying to make excuses for them, but they were the only intraday data service that could deliver a reasonable amount of historical intraday bars over the feed. You have to have historical data to build neural nets and also to backtest traditional trading strategies. It's that simple.
TradeStation Pro can do it, but they aren't a data service. There may be other outfits like TradeStation that deliver this data as part of some software they sell, but as far as we know, Quote.com is the only data service.
At this time, we are working hard to support UMDS, the Universal Market Data Server [now M3] (www.uniserv.com <http://www.uniserv.com>). When we complete this effort, you should have a number of other satellite and cable data feeds available to you. The problem of historical data, however, will remain. You are going to have to leave UMDS on for a while to collect historical data, or you will have to get it somewhere else, like Tick Data, or Quote.com. It also may be a while before UMDS supports internet feeds.
As a TradeStation provider, we are also trying to be able to provide you with TradeStation Pro's intraday data. TradeStation is not going to make this easy for us as they are not providing any means for 3rd parties to link to their data server at this time. However, we are exploring other means of extracting the TradeStation Pro data. This will be a good solution for those who already own or plan to own TradeStation Pro.
As part of the two efforts above, we are also planning to provide some sort of Data Input API in the NeuroShell Trader. This will let those of you who have some programming capability fire intraday data into the Trader from any source to which you have programming access.
Now, what can you do in the meanwhile?"}

Of specific interest is the part about the Data Input API. Being in the UK is it somewhat awkward to get the data feeds associated with securities I trade, namely, the FT-SE 100 index, CAC and DAX 30 indicies. I also trade the DJIA and S&P 500 indices.

I therefore use a DDE feed from the trading platform, Market Master and feed that via a database to a CSV file which I then open in NeuroShell DayTrader Professional.
Although this works it is clearly limited and is usually a minute behind the market. I have to manually open and close files to get NST to update the chart.

What I would like to know is are you still planning to expose the API in NeuroShell Trader or do you intend for users to opt for the M3 solution with the SDK for such non standard feeds?

Thanks

Ergo

Re: M3

Date :12/20/2001 12:58:36 PM Poster : Webmaster@ward.net

Check with MarketStream to be sure, but our understanding is that the DDE on M3 is DDE of M3 data out to the program, not DDE from a data provider into M3.

Neural Shell 3.5 Install and WinXP

Date :11/30/2001 1:10:13 PM Poster : Steve Kratochvil

My experience: I unzipped to my D:\Box directory. This is just standard for me as part of my file organization system. Once the 3.5 update process hit the steup error in WinXP that is OK to by-pass and finished, my NSTRADER.exe was not replaced. The last step of moving everything into the directory failed. Go back to your directory (D:\Box) where you unzipped the update and double click SETUP.exe. This time WinXP will ask if you about the NST 3.5 install. Click repair and it will re-run the install again, this time the installer will not need to remove the old version so it will update correctly and you will be off and running.

Re: Neural Shell 3.5 Install and WinXP

Date :11/30/2001 1:37:25 PM Poster : webmaster@ward.net

The standard prodecure that NST is set up for is to remove the old version before installing the new one. Go to the Control Panel and use Add/Remove Programs to do that. Don't worry, your charts, templates, data, etc won't be removed as long as they aren't the same name as one of our example charts, templates, etc. Hopefully, using the Add/Remove procedure will avoid the problems Steve K experienced.

I have what sounds like an identical setup to Steve.NST is on my D,Win XP,errors on install,etc. These errors still remain even after uninstalling and removing all files (exept for chart/data folders). My situation was slightly different in that win XP was a clean install on my C drive. If you follow Steve Kratochvil's process problem is solved.

Aerie has used an ATR dynamic trailing stop for many years. We find it very useful with futures and intraday stock trades. Also find it great for longer term trends (weekly). Currently, the only software we have available is for TradeStation 2000i. Would be willing to make an indicator and function available to those with an interest.

M3 Market Data Server

Date :12/6/2001 3:55:34 PM Poster : Steve Ward

As most of you know by now if you got our newsletter, we are beta testing the M3 Market Data Server. At least we hope to. So far we have no indication that anyone is starting to do that. I hope that means that there are no problems, and not that nobody is interested. I would like to hear from anyone starting this process, and encourage others of you who have expressed frustration with Quote.com to participate. In case you didn't get the newsletter, read the section of this site called "Release news, upgrade information and costs, beta tests."

Re: M3 Market Data Server

Date :12/15/2001 7:03:22 AM Poster : Robert Wilcock

I gave up on Quote.com a long time ago and now use e-signal, partly because it is more reliable and primarily because they provide intraday data for currencies. Consequently I have not been able to use the daytrader for some time.

I have asked before, with no positive response, but is it likely that we are going to see support for this, or any internet feed other than quote.com, at any time in the future?

On 12/6/2001 3:55:34 PM Steve Ward wrote:

We generally do not reveal specifically what development efforts we are working on until they are ready at least for Alpha testing. There are many sound reasons for this we have learned the hard way in the 20 years we have been in business. For one thing, if we fail to develop an interface (usually because the other side doesn't cooperate) then none of our users is bitter that they were promised something we couldn't deliver. As an example, we spend $thousands on the intraday interface to the 2000i Global Server with no help whatsoever from Omega, and we finally had to release it "unsupported" because of constant crashes in the Global Server experienced by about half of our testers.

On the other hand, I am personally disappointed that there is very little interest in M3 so far. We and MarketStream have spend hundreds of hours in development of this interface after hearing non-stop complaints about Quote.com specifically and internet transmission in general. Everyone wanted Comstock and DTN on transmission media more reliable than Internet. MarketStream has been very cooperative, unlike others, and the interface appears solid to us.

Nevertheless, we are indeed working on another internet feed, but internal testing so far has shown that other feeds have problems over the internet as well. If you want real reliability, try satellite with M3. Our Australian users may want to try MarketCast. I will see to it that anyone who starts using DTN or Comstock or MarketCast or Hyperfeed before the end of January with M3 and continues for at least 2 months will receive one of our add-ons free.

Furthermore, if the MarketStream people start seeing some interest in M3 from our users, they will add more feeds, including internet feeds. Once they add something, you've got it because we talk to M3.

Re: M3 Market Data Server

Date :12/17/2001 9:41:51 AM Poster : Steve Kratochvil

Rest assured that there is great interest in the M3. Moving from one datafeed to another can be a very challenging process. Most people being creatures of habit have only kept the Quote.com and closed the other feeds if they had them. It is the exception or developer that would have more than one feed for any reason. I am going through the motions even now with Comstock just to get it online.
For the out of box experience the M3 installed on my WinXP machine without event. That is a very go sign. I wish to personally say thank you for making it possible to even attempt to use another datafeed. This option also will now allow some to fill out their backup plan and give the added security with additional datafeeds if their current one goes down and they need to exit a trade. If you do not have disaster recovery options then you are forced to roll the dice and hope all goes well. We already know that things happen often with datafeeds. Your efforts are well received. It is more the sleeping giant that acquiring a datafeed can be. The M3 is not just a nice feature to use it is an integral part of a solid and secure trading system.

I am very pleased

Thanks,

Steve

Trading strategy - exit signals

Date :12/10/2001 8:19:42 AM Poster : Jimmy Raineri

I want to create a trading strategy that is "always in" the market -and- that closes all positions at a certain time of the day unconditionally.

The only way I've been able to do this is to use the long/short exit conditions (when 1 is true) and put a time >= xx:xx:xx, and also the same conditions I have for entry into the opposite side of the trade.

My "problem" is that, for example, the "long exit" condition(s) and the "short entry" condition(s) optimize differently (same for "short exit" and "long entry") - therefore I'm no longer "always in".

Is there a way that I can either have an exit condition actually be a pointer to the opposite entry condition - or - is there a way to tell the trader to exit (for example) a long position on -either- a long exit signal -or- and short entry signal?

Or is there another way to do this that I am not thinking of? Thanks!

Re: Trading strategy - exit signals

Date :12/10/2001 2:16:11 PM Poster : Webmaster@ward.net

In the current release of the DayTrader, there is no way to have long entry and short exit conditions optimize in any synchronized fashion. We can make strategies that are always in the market, and we can make them exit unconditionally at the end of the day. We can even optimize these, but we can't do all three things at once. There are some tips on this site related to a similar problem with stops that may give you some ideas:

How the Trailing Stop Interacts with the Exit Order in a Trading Strategy (10/16/2001)

How to Create a Trading Strategy with Both a Limit Order and a Stop Order Active at the Same Time (10/16/2001)

Reversal Trading Strategies (10/9/2001)

The only way I've been able to do this is to use the long/short exit conditions (when 1 is true) and put a time >= xx:xx:xx, and also the same conditions I have for entry into the opposite side of the trade.

My "problem" is that, for example, the "long exit" condition(s) and the "short entry" condition(s) optimize differently (same for "short exit" and "long entry") - therefore I'm no longer "always in".

Is there a way that I can either have an exit condition actually be a pointer to the opposite entry condition - or - is there a way to tell the trader to exit (for example) a long position on -either- a long exit signal -or- and short entry signal?

Or is there another way to do this that I am not thinking of? Thanks!

Trading Strategy improvement

Date :12/14/2001 1:02:30 AM Poster : Al Martin

What's the possibility of gaining more flexibility on trading strategies. I am thinking particularly about money management. I would like to see the NS Trader equipped with a Fixed Ratio option which would be a great assist to actual trading. Of course I am referring to concepts that are currently popularized by Ryan Jones. In a nutshell the theory states that you can acheive a geometric amount of profit from a viable system by altering the percent of shares purchased based upon your overall capital where each trade is based upon a changeable and dynamic trading bank. If what I have read from Jones and from Murray Ruggierio is correct, than money management is far more powerful in terms of outcome than the trading strategy alone. Indeed I have seen demonstrations where the actual number of winning trades is the same but the earnings can be more than 5 times as much.
I recognize that for an initial development of a trading strategy one would be more interested in developing a winning percentage, but when you are ready to actually trade, I would love to see the trader's capabilities enhanced with this ability.

Re: Trading Strategy improvement

Date :12/17/2001 12:40:41 AM Poster : Jana

Hi Al,

While I do agree with the fact NS Trader would benefit from having MM feature(s) included, my personal opinion is there are several "more essiantial" features which we still waiting to materialise. What I mean I could live with running MM using separate software and my focus for NS Trader still remains in developing original system.

Just my humble opinion for whatever its worth.

calling datax from excel

Date :12/17/2001 6:27:41 AM Poster : philippe bousseau

i am considering buy your datax éapi add on, but because i am not a programmer un wish to know if i can simply call a predict price or buy/sell signal through excel ? Your M3 interface looks pretty good for the while :)

Re: calling datax from excel

Date :12/17/2001 8:44:25 AM Poster : Webmaster@ward.net

If you were a Visual Basic programmer, you would be able to transfer signals to Excel through a VB program also interfacing with the NeuroShell DayTrader through DataX. Please do not purchase DataX, however, unless you are either a programmer or have one available. It will not be much use to you.

On 12/17/2001 6:27:41 AM philippe bouseau wrote:

ERROR MESSAGES

Date :12/21/2001 6:33:03 PM Poster : Vince

Often, during an optimization I get the following error message:

"Error in GetPopulation -> Too many populations."

It is so annoying that I have to close the Trader and restart to proceed with my work.

First of all, what is it?
Second, why does it happen?
Third, how can we I avoid it?

I hope someone has the answers.

Thanks

Re: ERROR MESSAGES

Date :12/27/2001 10:38:30 AM Poster : Webmaster@ward.net

This is not even a normal error, so next time you see it, please note what it is that you are doing and contact technical support with that information. They will want your chart too if possible so they can try to reproduce it.

MESA addon 3rd party upgrade

Date :12/27/2001 1:45:14 PM Poster : Russell

MESA2000, a Neuroshell third-party addon, has announced an upgrade (MESA2002). But it is only an upgrade for the standalone MESA product. After attempting to upgrade the addon for Neurosell Trader, I received an email from John Ehlers saying that "Sorry, but we don't yet have the update for Neuroshell available. Right now it is vaporware, and I don't have an estimate when it will be ready."

Russ Koester

Re: MESA addon 3rd party upgrade

Date :1/4/2002 10:23:03 AM Poster : Webmaster@ward.net

We have contacted the MESA people and they have told us they plan on finishing the DLLs for NeuroShell in just a few weeks.

Fuzzy Logic

Date :12/30/2001 12:14:49 AM Poster : Steve Kratochvil

I am really warming up to this. How as anyone been doing with Fuzzy Logic? I have been testing and find that the FuzzyGA indicators are superior to their counterparts. I know that the help file says that it is humanly impossible to set the parameters of the GA but I have been poking at them just the same. I am currently beating FuzzyGA1(Close,2,5,0.05,0.05,0.1,2) up and down left and right. Any ideas will be greatly appreciated.

Thanks,

Steve

Re: Fuzzy Logic

Date :1/2/2002 8:06:33 AM Poster : Webmaster@ward.net

You probably mean that you are beating the optimizer out-of-sample (backtest period), where the optimizer does not optimize. If you are indeed beating it in the optimization period, then you just need to optimize again, telling the optimizer to continue where it left off. It should get as good as you are setting parameters for best results in the optimization period.

On 12/30/2001 12:14:49 AM Steve Kratochvil wrote:

Re: Fuzzy Logic

Date :1/2/2002 7:19:04 PM Poster : Steve Kratochvil

Yes indeed, I am manually working the values. I did the optimizations using full optimization and was not getting what I was looking for, but it did spark my imagination as to how I might start working with the indicators. In light of your comment, I am now re-running a FuzzyGA5 prediction with full optimization.
To explain why I am heading into the Fuzzy Indicators manually let me start with this. I see the Fuzzy Indicators as being able to determine a shape exactly as I see it on the screen. If I am looking for a particular shape they are perfect. Once I have the shape located I will then check a small panel of experts for mitigating information. I like velocity in this case. As I can use Fuzzy Indicators to identify shapes, the Fuzzy Indicators are like absolute candlestick formations, only more interpretive of the data, similar to a moving average. The Fuzzy Indicators have two great opposing qualities of static shape with smoothed average. This ability has been increasingly more productive at giving solid tradable signals.

Thanks,

Steve

Errors

Date :1/4/2002 2:14:24 PM Poster : Hans Friedli

Hello

I just wanted to post some errors i still encounter from time to time with all the recent Versions of NSTP up to the latest version:

Error in MakeChromosome -> Invalid Population Number
Error in SetStrategy -> Invalid Population Number
Error in SetOperators -> Invalid Population Number
Error in PutChromosome -> Invalid Population Number
Error in GetChromosome -> Invalid Population Number

All these errors occur at once. It often happens under following condition:

- i'm calculating a trading strategy with 50 or more stocks (sheets) added

- while NSTP is calculating and it takes me too long to wait for the end i abort the running calculation

- while aborting, when NSTP asks for a rebacktest/recalculation i press cancel for a rebacktest without a new calculation

- while rebacktesting/listing all the stocks in the results window the results from the last completed calculation are presented and now it happens: while listing it crashes with the above mentioned errors.

I hope for a fix in the next release.

regards
Hans

Re: Errors

Date :1/4/2002 4:25:17 PM Poster : Webmaster@ward.net

Yep, this is the basically the same error Vince posted about on 12/21 and helped us find by sending us his chart and a description of what he did to cause the error. It occurs because genetic populations aren't getting freed up when an optimization is stopped prematurely. It is usually only noticed when there are a large number of stocks that are stopped prematurely. It will definitely work correctly next release.

Voting Between Trading Strategies

Date :1/6/2002 12:03:51 PM Poster : Andy Bower

First of all, apologies if I've missed something but I think I've checked the help files and this forum for a solution but without success.

I have a number of (vaguely promising) Trading Strategies, four based solely on indicators and one a net prediction. I want to feed these into a final Trading Strategy so that I can vote on whether to go long or short based on 3 out of 5 of these inputs being long or short at a time. However, the effect when I feed the original TSs into the arbitration TS is not what I'm looking for. What I see is that the final buy and sell signals are based on whether the input strategies triggered signals on the same day. What I what is to say that if three of the five inputs are currently long (or short) then the final output will be a buy (or sell) in that direction.

Is there any easy way of doing this. I realize that I can do what I want by feeding the inputs of the original TSs into my final strategy but I'd rather not do this since I'd like to be able to independently test the inputs.

TIA

Re: Voting Between Trading Strategies

Date :1/7/2002 8:37:25 AM Poster : chris wong

theres an indicator called position i think you could use for this. just put 5 of these indicators in your chart each referring to one of the original 5 ts. then in the arbitration ts for long entry test all 5 to be = 1. if three of the tests are true you go long. for short you test to see if they are -1 and go short if three are true.

Re: Voting Between Trading Strategies

Date :1/8/2002 11:41:53 AM Poster : Steve in California

I'm a NSDT newbie and have received great benefit from the postings in this forum.

I have a couple questions and some initial thoughts about answers to the questions that I'd like to put to the group. I don't have any empirical data relating to these questions. I'm just looking for a few more ideas about what to try.

The questions are these:

1 What are the various ways to organize indicators within and across indicator sets in a hybrid trading strategy?

2 What are "kinds" of indicator sets that make for good rule sets within a hybrid trading strategy?

Thoughts about answers to base optimization runs on:

1) Organize indicators within a rule set such that all the indicators in a set have a FOCUS on the same general timeframe. (That is, if there are three rule sets, the first rule set is focused on the smallest timeframe and the second is focused on a larger timeframe (Elder and Kase recommend about 5 times larger) and the third rule set is focused on a timeframe even larger than the second. My initial thought was that this was the best approach

2) My thinking has evolved to a place where it seems as if each rule set could be focused on a specific kind of market indicator concept. For example, set 1 might be the "Trend Rule Set" and consist of 3-5 optimized RedHaar or JMA-MACD indicators and their slopes. Set 2 might be the "intermarket" rule set and be focused on correlations of smoothed oscillators of the focus data with other comparable oscillators for other data series. A 3rd rule set might focus on Support/Resistance oriented indicators....

What do you think about this first question: i.e., How does one structure indicators in Rule Sets?

2 The second question has to do with the kind of Rule Sets that make sense to develop. I've mentioned 3 kinds above (i.e., trend, intermarket, and support/resistance rule sets). Are there others that also make sense? Like a "patterns" rule set?

Thoughts?

Steve

Re: Voting Between Trading Strategies

Date :1/8/2002 11:58:20 PM Poster : Steve Kratochvil

We are getting quite a collection of Steve's in this forum. My personal opinion is that Yes patterns are critical to your system. I recommend that you get the Fuzzy Indicators and pattern your other rules like the ones you have mentioned or other indicators. The biggest advantage that I can see using patterns is that they do not lag. They can give you an accurate right hear and now picture of what is going on with clear interpretation of the right edge.

Glad to have another Steve.

Thanks,

Steve

I don't think the replies that followed are related to what you are trying to do. If you wish to have a vote based on consensus of a number of indicators less than total consensus of all indicators then do this:

For each buy or sell indicator give it a 1 if it is signaling else it is a 0. Add the indicator types (buy or sell) together and if they are greater than or equal to your target of consensus then send a signal to buy or sell.

Example:
If you have 10 buy indicators and wish to execute a trade when 7 are sending a signal to buy then A>=B(Add2(Add4(indicator, indicator, indicator, indicator),Add3(indicator, indicator, indicator),7)

You may need to use the Threshold indicators to maintain the persistence of the signal coming from indicators once they change.

I seem to be having some trouble getting my posts to come up. Here we go again. I have broken the fuzzy pattern angles into percentages of the Max Change and compared them to the actual Max Change. Depending on where the angle falls I give it the corresponding value of 2,1,0,-1,-2. That is the short version.

Thanks,

Steve

AIQ

Date :1/14/2002 9:16:36 AM Poster : Ergo Mann

Sirs,

Given my on-going quest to find a feed that will update NeuroShell Day Trader in real time, I have come across AIQ.

I know from the FAQ that NSDT reads AIQ files, however, I would ask if NSDT can refresh the updates as they occur to AIQ files.

Many thanks

Ergo.

Re: AIQ

Date :1/14/2002 2:17:58 PM Poster : Webmaster@ward.net

No, NSDTP cannot update AIQ files in real time - only daily files.

Re: AIQ

Date :2/5/2002 1:22:50 PM Poster : maciej

Hi Ergo,

The way I use AIQ is to download EOD and take a copy to a separate folder which NST can see. This way it avoids any issues. Its not too neat but it works. NST will find the directories which you can then confirm. Make sure that you have the latest AIQ dlls from Ward.

Hope that helps.

Regards,

Maciej

Jurik indicators crashing NSDT

Date :1/22/2002 1:58:50 PM Poster : Steve K

The jurik indicators are crashing NSDT when optimizing -- the more jurik indicators optimized the faster it crashes OR the jurik DLL stops responding and NSDT has to be restarted-- I've been on the phone at least a dozen time with Jurik research over the past week trying to troubleshoot it, they were very helpful, but can't find the problem -- is this another bug in NSDT?

When it crashes the error message is "error #7: out of memory" -- this is not a windows error because I have plenty of memory available at the time of the crash, it is an internal NSDT message. It has cropped up from time to time in the past, but jurik indicators trigger it so much that they are unuseable

Steve

Re: Jurik indicators crashing NSDT

Date :1/23/2002 8:56:19 AM Poster : Webmaster@ward.net

So far, we have agreed with Jurik Research to jointly support four of their indicators - JMA, VEL, CFB, and RSX. We have built our own template files for these and they are posted on this site under "New and updated examples". Please use our templates and make sure your DLL is dated at least as recent as ours (11/10/01). If it still crashes send us your chart and we'll definitely look into it as well. We did have at least one other user who got memory errors but reported that they went away with our templates and a different version of the JMA DLL. We'll try to get him to post more on that here.

Just to keep everyone updated, several users have sent charts that do crash after quite a bit of optimization with the recent DLLs. Both Ward Systems and Jurik Research are working together to find the problem, so far without being able to pinpoint exactly whose it is. It may be some sort of conflict between programs. One thing we found already is that it doesn't occur with Windows 98 or Windows ME - only Windows 2000 and XP. We continue to investigate.

Re: Jurik indicators crashing NSDT

Date :2/15/2002 11:51:51 AM Poster : Steve K

Jurik Research has sent me a new DLL that corrects the crashing problems with NSDT and Win2K
Ward Systems conclusively traced the bug to the Jurik.DLL and Jurik Research then traced the bug to a microsoft DLL that was being called
and has a memory leak. The win98 version of the microsoft dll doesn't have the bug which is why it only effects Win2k/XP.
Anyway Jurik was able to work around it and fix the problem once it was isolated

Ward Systems & Jurik Research were very helpful while resolving this obscure bug!!

Good detective work guys.

thx, Steve

Mutual Fund Trader Needing Help

Date :1/28/2002 7:03:55 PM Poster : Dave

I'm new to NeuroShell Trader and needing some help.

I'm trying to develop successful Trading Strategies for Mutual Fund Trading. My preference is to have a low number of trades per year (i.e. 1 or 2 per month) and yet need to be able to exceed Buy & Hold returns.

My approach so far has been to try to develop some Trading Rules on indexes: Nasdaq, S&P 500, Russ 2000....etc. and then apply these to the mutual funds that would be most closely correlated to the index. Initially I have only used Moving Averages.

Has anyone had some success they would be willing to share?

Thanks so much.

Dave

Re: Mutual Fund Trader Needing Help

Date :2/4/2002 12:48:17 PM Poster : Mike Oldroyd

I do something slightly similar in that I trade Exchange Traded Funds. These funds have exchange symbols that you can directly download and model. There are quite a few of these funds, some common ones are

QQQ (known as the cubes) - a proxy for the Nasdaq 100
DIA (Diamonds) - a proxy for the Dow Jones Industrial Average
SPY - based on the S&P 500

SPY and DIA are usually pretty closely correlated, so you may not want to trade both of these.

Any help?

Mike

Re: Mutual Fund Trader Needing Help

Date :2/10/2002 8:06:40 AM Poster : Bill VanDyke

Dave,

Some of the most profitable models I've been able to build have been those of Mutual Funds. I have used index data..and data from the fund itself..to build models. My only caution is...that when using fund prices....use prices that have been adjusted for dividends or distributions; otherwise you will only be fooling yourself using data that is incorrect and developing models that might not beat a buy&hold strategy in real time. For example, one fund i model...using the fund price data from Yahoo or Microsoft's Money Central....where the fund prices are NOT adjusted for distributions, showed the fund to have a total return of 50% in 1999, when it actually had a return of 75% considering distributions. I use Fasttrack as my source of Fund and other index data as they adjust prices for distributions. They can be found at www.fasttrack.net Good luck.

I do see why using prices adjusted for dividends and distributions is necessary for comparing to buy and hold. On the other hand, although I am certainly no expert on this, I have been reluctant to do shorter term trading models with dividend adjusted data out of fear that resulting sudden adjustments in prices will have an unnatural affect on the model. After all, the model inputs won't see these adjustments coming unless you either have some sort of date inputs or you assume that buying somehow correctly anticipates the earnings. The latter seems a little iffy to me, and I'm not sure how to adequately implement the former.

Bill,

Thanks for the input. Yes, I do use dividend adjusted data. I've been using AIQ/Track Data and also Monocle Systems data base for Mutual funds, both of which adjust for dividends.

I'm interested to know, if you're willing to share, what indicators and parameters you have had the most success with?

Fuzzy

Date :2/6/2002 11:10:06 AM Poster : claude

Hi everybody,

Suppose I am looking for a fuzzy3 that rises sharply then rises then remains steady (so 2, 1 ,0). If I say 0.5 is the maximum variation after that it will be "rises sharply".

Then what is the change line between remains steady and rises? Is it exactly 0 or something between 0 and 0.25?

Thank you,
Claude

Re: Fuzzy

Date :2/6/2002 8:21:18 PM Poster : Steve Kratochvil

This is what I have done. I first determine the slope of the line as positive or negative. I then determine the total distance between the first and last segment bar. I use 1/2 the distance as the pivot for the line. I then adjust the lines angle so that it closely matches the close of the segments. The values that I used to determine the type of line I had were 0 = 0 to .249 and 1 = .25 to .749 and 2 = .75+ that has produced rapier accurate Fuzzy Patterns for me.

Thanks a lot Steve for all your inputs about the Fuzzy indicators... it's very powerful.

But I still have my question: When you say "The values that I used to determine the type of line I had were 0 = 0 to .249 and 1 = .25 to .749 and 2 = .75+ ", the only thing you can specify to the Fuzzy is 2=.75+ right?

How can you specify to the Fuzzy that 1 is between .25 and 749? And how can you specify that 0 is between 0 and .249? The only parameter I can adjust is the maximum change, that means the change between 1 and 2 or .75 in your example. Am I forgeting something?

Re: Fuzzy

Date :2/11/2002 10:30:51 PM Poster : Steve Kratochvil

As I read back through the reply I gave I see that I have omitted the source for the ranges I gave. These are the percentage band ranges that I have used in a program I created to help me find Fuzzy Patterns. The program I created takes an export from NSDT and imports it into a Access2000 database. The FuzzyFinder is a little VB6 app that I have built to draw the Candlesticks and visually plot the fuzzy pattern on the screen. I then click on any of the bars and it tells me what the fuzzy pattern is to get to that bar. I have given it the ability to guess what the Max change would be or I can set the value and it will change the fuzzy pattern

indicator setting accordingly. The ranges I gave are from the logic I used inside my app to determine the fuzzy pattern.

With your farther inquiry I understand your question a bit better. You are looking at the Max change and trying to directly translate the value range it point for point. The values I have given are percentages of the Max value. Example:

If a stock has a price of 60.31 and you set the Max change at .75 that would mean that a 2 would be the positive and –2 would be the negative coming to this bar if the segment bar before was $.75 distance away. The ranges I have given would read like this 75% of $0.75 is $0.56, 25% of $0.75 = $0.18 and 0% = $0.00.

In my logic I assigned the percentage ranges to the Fuzzy Indictor setting codes so that I could translate the distance moved by my application.

To determine the speed of the slope use more or less segments in your Fuzzy Pattern. The more bars you use the slower the pattern. This is mitigated by the size of the Max value. If you use a small Max value on a large segment indicator it will be quick to react and stay active for longer periods.

Fuzzy Logic

Date :2/7/2002 11:53:44 AM Poster : Steve Kratochvil

One thing that I feel needs to be mentioned. The Max change and Segments setting values of any of the Fuzzy Indicators needs to be able to take a variable so that an adaptive input could be created. As it stands these are static and this needs to be considered when using the indicator on periods that have greater or smaller ranges. If you are looking at the close then issues with a price in the 10 to 20 dollar range might have compatibility but if your issue is trading 50+ then the settings for your Fuzzy Indicators will not react correctly.
If you use other indicators as input to a Fuzzy indicator and the input has a preset range then your setting would be fine. Example: Polarized Fractal Efficiency has a range of –100 to 100. Using fuzzy on this indicator you can determine slope and direction before it crosses the 0. This is just one use of the Fuzzy Indicator.

Steve

Re: Fuzzy Logic

Date :2/9/2002 11:14:12 PM Poster : Steve Kratochvil

Another thing that I see is that the Fuzzy indicators can make great inputs into a neural net. The Fuzzy indicators have both a normalizing and Boolean effect on data making it better for a neural net to work with. As I have been looking at Fuzzy indicators I am now stepping into the FuzzyAND indicators and the FuzzyOR indicators. This combination of other Fuzzy patterns allows you to have a Fuzzy1(Lag(Close,3),-2,30,1) AND Fuzzy1(Close,2,3,.12) together in an attempt to signal a buy. This pattern matching is like candlestick patterns. I love candlestick patterns and these Fuzzy Pattern indicators take the concepts of candlestick patterns to a new level. The Fuzzy indicators are much more powerful and accurate compared to candlesticks. You just need to use them.

In addition to my comment below. The Static condition of the Fuzzy indicators can be used as a filtering quality on stocks. If a stock is not doing enough to trip the fuzzy indicator strong enough for your tastes, then maybe your logic is sound and the stock is just not worth trading. Food for thought. As with most indicators they have two points of view and you decide what you are trying to find. Use the indicator appropriately for that point of view.

Neural Nets

Date :2/9/2002 11:38:41 PM Poster : Steve Kratochvil

As things are moving along I am looking at where a neural net should fit into my trading strategy and which ones are best to use. I have been sampling around. I did just like everyone else. I got the product I picked a great stock and then ran a Ward4 net on it and waited for it to perfectly predict the stock. Sad thing is. The neural net traded about as well as I could with out it (That was not good). I then took the AI college, even thought Steve is very long winded; I had my eyes opened to how I could use the Neural Shell Day Trader. This epiphany was all that I needed. The AI College had cleared up my Neural Net ideas and I took off. I have been building things like crazy and mixing everything that I should not. I have even burned out one hard lock already and I am working on my second. As I have been conceptualizing things Neural Nets have not really been part of the plan. I have just been building powerful indicators and learning how to make the Neural Shell screens show data more visually. If you don't know. You can have more than six indicators visible on the screen at a time. You can only have six window bands but each indicator band may have more than one indicator in it. I like to put me moving averages on top of my trading strategies or the close. I use them as absolute direction indicators if all else fails. I then use other indicators to determine what to do in between moving average changes (This is were the best trades are). Then after I have clear direction and other signals. I am seeing that these need to be the inputs into a neural net. I believe that the quality of the neural net's ability to accurately see the picture and predict trades depends on the quality and relevance of the inputs. Feel this way because if the Neural Net is an image of our mental ability then it would be just as lost in the example I first mentioned as I am when I look at the close plotted before me. I have yet to test this idea. I am hopeful with my serious push into the neural nets and their application to my trading system.

If anyone has any great advice or nets that they have used I would love to hear about it.

Steve

I think there's a couple of issues here. Firstly, someone may have some pretty good results, but not excellent, and they may be a little shy about putting their work on display for critique. Secondly, there's always the worry that if you give out your exact chart, then suddenly hundreds of NST users are making the same move you are and maybe competing. I think I fit in both categories, but I think like others I'm willing to share ideas I've developed if not the exact details.

So how do we all start sharing? I agree with maxwell in principal

But I do not thing that we with Neuroshell can trully influence a highly liquid
stock or future.

I have the feeling that we have a lot of very bright peoples playing with neuroshell but not trading with neuroshell, I hope I am wrong.

A good net should work across many equities etc etc otherwise it be overfitted. Therefore we should not worry about negating the net.

REVAHDAN, I have debated responding to your post for similar reasons as expressed by Claude and Max. I said to myself, "If I have the Holy Grail. Why would I give it away for free?" I feel I have the Holy Grail. I have worked months on it. I have paid for training with the AI College. I have studied all the examples that are provided in the basic set up and all the one's that can be down loaded from Ward.net. It was from these examples and sound basic technical indicators that I found very profitable inputs for Nets and Fuzzy indicators. There are plenty of examples of things to look at and learn from.
On the other hand I did feel the lack of a manual when I first purchased the NSDT. A good old-fashioned manual was what I needed. I then set about to build my own trading bible. I started converting the Help files into word doc's and have begun working on my Neural Shell Day Traders Bible for myself.
I have also though about the idea of everyone trading the same trades I am. This is a fear that has gripped thousands of people before and will continue on into the future. This has been a concern voiced in Newsweek over the use of artificial intelligence in trading systems.
This is how I view things. The reason some indicators work better than others is because everyone can see them and react in unison at the same time. This ability for an indicator to be used in the same fashion by every one is why these things even have meaning. I then see that if a small group of people can trade in the same direction that I can, it will only fuel a greater reaction and make more money. Then this goes to the other end of the spectrum where if everyone is trading like me the money gets spread thin and my trading system is null and void. The truth of enough people being able to trade at the same time as me and in the same direction as me is remote and not really plausible. This is farther supported by investment clubs or groups that all trade in unison for the added increase in returns.
In closing I have no objections to the content of your demand. I just object to being demanded and indirectly criticized for working hard and sharing about it in the forum because you can not find any examples. I will advise you to search the ward.net site for examples. You will find many there. Also go back through each and every forum post looking for the examples given. Then review the examples provided with your NSDT purchase. I feel that you will be pleasantly surprised and that will find more than enough examples. In the interest that your content is valid, I will endeavor to post more lenigthy and detailed examples that will hopefully benefit everyone. I will also be expecting some examples coming from your direction.

Steve

Re: Examples Examples Examples

Date :2/16/2002 9:19:03 PM Poster : REVAHDAN

Great response!
However let hope we can get more people involved in this realife exchange of ideas. And yes I most definitely will share my ideas and hope others will.

With all this talks how do we post on this discussion group.

Ward.net should provide a way for us to post charts, indicators etc etc.

Looking forward to a great exchange of ideas.

Thank you
Daniel

Your right, I had to work a long time to get where my chart is now too, and I even took the class. You say that if everybody trades the way you do then you'll make more money. Now I'm just a cowboy, but isn't that only true if you get there first? What if the heavy hitters buy your chart first, then you ain't getting the choice prices on account of them driving the price up before you get there. When I was buying neuralshell trader, Steve Ward told me about some car company that trades millions of bucks of S&P futures with the ward nets. Guess what - I trade S&P futures sometimes too, but only one contract. Suppose I post my net and they take a liken to it and get in ahead of me. I lost some money before I start. Hey, if they want my chart, they can send me a few new pickup trucks every year for it. But I did get lots of help hear at this forum so I'm willin to help others too, I'm just afraid to put up my exact recipe.

Hi Steve,

I JUST bought NST. I was shocked that $3000 on software didn't even have a manual..(unless there's one hiding on the CD I haven't found). Is there any API or language reference for the NST functions? Would you recommend putting everything in a WORD file if you had to do it all over again? In essence, what's the best way to learn. I have some things I'd like to program in NST (I do web development and some C++ work). How hard is it to create a DLL vs using the wizards?

Was the AI training something you would recommend to a newbie NST user??

Thanks

Tom

The Ward group recommends the videos to learn and I have to agree. There is a manual in the help files you can print, but I tried that once and you'd better have a lot of paper ready. The videos cover just about everything you need to get going, but not the DLL functions I don't believe. I can't program so I can't help you there.

Hi everybody,
I've been reading about indicators, solutions, real trader tips, millionaires.
But, Is anybody who could tell us the truth how much money he earned using
NST? If answer is YES, how much money he had to invest and how long (annual return on account and so on).
Maybe we all are the members of 3000 $ spend club
Darek

Message from Jurik Research

Date :2/16/2002 2:02:01 AM Poster : Steve in California

I am one of the users who also had a problem using JMA with NSDT. I agree with Steve K's note that WSG and Jurik Research did a great job of working together to get to the bottom of a difficult to replicate bug involving JMA and NSDT on the Win2000 and WinXP platforms. Thanks guys!

I forwarded Steve K's note on ward.net to Mark and Norman at Jurik Research. Mark replied and asked if I could post the text below. (Note: I believe that the problem probably exists with NST as well as NSDT. Steve Ward can probably clarify for NST users.)

****

Jurik Research has just released an updated version of its tools for NSDT. This new version corrects a memory leak (system crash) problem. We advise anyone who has purchased Jurik tools for NSDT use to get the free update. E-mail your request for a free update to Jurik Research as follows:

TO: support@nfsmith.net
SUBJECT: upgrade for NSDT

Please provide an email address that can accept an email attachment 1.5 MB in size.

Re: Message from Jurik Research

Date :2/16/2002 1:31:44 PM Poster : Steve Ward

Yes, even I was surprised that two vendors with a common problem could work together as well as we did. I thank Andrei in my office and Norman in Jurik's office for all the hard work together on a very difficult issue.

From our tests and Steve K's tests, we believe that Jurik's new indicators will work with the existing version of NSTP. The thing that made this problem so difficult, in addition to it turning out to be a Microsoft problem rather than one of Jurik or Ward Systems, was that NSTP unloads DLLs after it is finished with them, then reloads when needed. I guess the original programmer figured that if the DLLs were just loaded and kept loaded, that memory would start getting clogged with DLLs. So if you ran the Jurik indicators with a test program that loaded them just once (as we did at first), you never saw a problem.

From the memory problem that you sent us, unrelated to Jurik, we found that PowerBasic DLLs also leak memory when loaded and unloaded. C and C++ DLLs do not. I have posted a message to this effect to the PowerBasic support BB. Any owners of PB/DLL compiler should add their posts to mine encouraging the problem to be solved soon and a fix released. The squeeky wheel gets oil. In the event they do not fix PowerBasic, in our next release we may have to change to loading DLLs only once, or allow some sort of option. Loading only once could even speed optimization some, so we may do that in any case, just prevent future similar problems, now that many users are beyond Win98 and Win ME (which automatically release DLL memory on unload).

On 02/16/2002 2:02:01 AM Steve in California wrote:
I am one of the users who also had a problem using JMA with NSDT. I agree with Steve K's note that WSG and Jurik Research did a great job of working together to get to the bottom of a difficult to replicate bug involving JMA and NSDT on the Win2000 and WinXP platforms. Thanks guys!

Example EMA312.cht

Date :2/17/2002 6:30:18 PM Poster : Steve Kratochvil

Every one wishes that they could impart to their trading system, there own human ability to see and recognize which direction the stock is moving. You would like to have a absolute indicator that said, "THIS IS A SHORT ZONE or THIS IS A LONG ZONE". This is the beginning of controlling and tuning your system and telling your Nets absolutely which direction that they should be looking.
Here is how I keep my trading direction always looking in the right direction.

Note: I have chart preferences of a White Background and Black Foreground. Set these buy going to the Edit menu and selecting Format Chart ... then the Colors tab.
I set my Trading Strategy color to "Light Gray" on the color bar

Follow these steps:

STEP 1: Insert an exponential moving average (EMA) indicator and place it on your trading strategy.
Go to the "Insert" menu bar to begin. Click "New Indicator ..." then "Exponential Moving Average" then "Next" then the indictor "Exponential Moving Average". Set the ExpAvg Periods = 3. Click, "Finished".
Move you mouse cursor over the name "ExpAvg(Close,3)" of the new indicator and "Right Click". A popup menu bar appears. Select "Rename selected Indicator ...". Replace the name with "EMA3" and Click "OK". Select the indicator by clicking on the name "EMA3". Then drag it onto your Trading Strategy indicator. When you drag the cursor will change to a small stretched out bolded N. When you drag over the other indicators a dotted selection box highlights the indicator that you are over. Release the mouse over the Trading Strategy. You will see the EMA3 overlaid on your trading strategy. Click on the EMA3 name and select Dark Red on the color bar.

STEP 2: Repeat STEP 1 for another exponential moving average indictor and set the ExpAvg Periods = 12. Change the name to EMA12 and set the color Dark Blue. This should have you set with two Exponential Moving Averages (EMA3 and EMA12) on your trading strategy.

Step 3: Insert an arithmetic indicator subtracting the EMA3 value from the EMA12 value and rename the indicator EMA312RAW.
Go to the "Insert" menu bar to begin. Click "New Indicator ..." then "Arithmetic" then "Next" then the indictor "Subtract".
Select Operand #1. Click "Set parameter" and scroll down until you see EMA3. Click on it and Click "OK". You have just set Operand #1 = EMA3.

Select Operand #2. Click "Set parameter" and scroll down until you see EMA12. Click on it and Click "OK". You have just set Operand #2 = EMA12.
Click, "Finished". Right click on the indicator name "Sub(EMA3,EMA12)" and rename it EMA312RAW.
Now "Right Click" on any of the white open space of the chart and select "Hide/Unhide Data …", scroll down until you see the Sub Graph with EMA312RAW, uncheck it and Click OK. This will hide the indicator.

Step 4: Insert another Exponential Moving Average base in the Time Series of EMA312RAW and smooth it out with 3 periods and rename it EMA312.
Go to the "Insert" menu bar to begin. Click "New Indicator …" then "Exponential Moving Average" then "Next" then the indictor "Exponential Moving Average".
Select the Time Series and Click "Set parameter", scroll down until you see "EMA312RAW" click on it and then click "OK".
Set the ExpAvg Periods = 3.
Click, "Finished".

Now you have an indicator that is cleaned up and very meaningful. This is a useful piece of information that you can tell your trading system. The interpretation and slant you put on the indicator is up to you. I am providing my example EMA312.cht with some of the possible points of view that one would take. The YES or NO is represented with an indicator EMA312 SHORT ZONES and EMA312 LONG ZONES. These have a filter tolerance of $.04 to clear out any noise in the indicator. The value of the YES or No of the Long or Short Zones. The Fuzzy Shapes of the Values of the Long and Short Zones.

Also in this example I am going to show the difference that this indicator has in contrast to everyone's first Net. I am talking about the first net you make when you get NSDT installed. This is the Net that you just drop down with the default inputs and hope you are baking a golden egg as it optimizes. I have called it the Generic Trading Strategy. The effect is no better than yourself staring at the lines as they come from the right side. The contrast is the point where the more meaningful inputs can be used to guide to better results. This is represented in the Improved Trading Strategy. In this example I am only using the indicator side by side with the results from the Generic Trading Strategy. This is yet another way to use meaningful indicators to guide you nets.

I have sent up the EMA312.cht

Note: If you are going to use NSDT you need all the tools. You need all the add-ons. Buy them, not for Ward Systems, but for you.

Steve

Indicators TEMA and RVI

Date :2/19/2002 12:56:50 PM Poster : Steve Kratochvil

I have sent up two new indicators that I have found interesting. These are two indicators that I have found in my study (You must study) and built into the NSDT so I thought that I would pass them along. It also shows how you could build other indicators that you find along the way.
The two indicators are TEMA and RVI. Triple Exponential Moving Average (TEMA) can be used in place of a regular EMA. It is fast like a very short EMA but smooth like a long EMA. I like it.
The Relative Volatility Index (RVI) was just another that might have potential to keep me out of a whipsaw. I don't know yet, but I am looking at it and thought it might be of use to others.

The two charts are TEMA.cht and RVI.cht

I was unable to load these intraday charts.
My NST version use EOD data.
I wish someone helpful would change the timescale to daily bars
and as time serie use one of the issues in the NST examples,
Boise Cascade, Exxon,S&P500, Merck or Intel.(I don't have NVIDIA).

Is it possible to upload these charts again??

Jacobs

Re: Indicators TEMA and RVI & EMA312

Ok, here are two of Steve's charts as requested, converted to daily bars using the data from the S&P example. From them you can get his RVI and TEMA indicators. However, we are reluctant to try to convert his EMA chart, because his trading strategies have buy and sell signals which we do not feel qualified to try to reproduce on a daily chart. They are part of the art of intraday trading he is trying to convey, and we aren't at all sure they will be useful on a daily basis. They also use the Fuzzy Pattern Recognizer and Neural Indicators, and will thus be useless even on his 1 minute chart unless you own those addons. If you note Steve's text, however, he explains step by step how to build his indicators. We thank Steve for these generous contributions.

Re: Indicators TEMA and RVI & EMA312

Date :2/26/2002 6:15:41 PM Poster : Steve Kratochvil

I tell you what. With the TEMA, I will show you the formula, I will show you how to build one and give you a tpl that you can use. I will also show you how to reconstruct the original indicator from the tpl. I hope that I can shed some light on how you can bring your formulas into an indicator.

Here is the mathematical formula. (3 * EMA) – (3 * EMA of EMA) + (EMA of EMA of EMA)

Here is the NeuroShell Formula:

Add2
Operand #1 = Sub(Mul2(ExpAvg(Close,9),3),Mul2(ExpAvg(ExpAvg(Close,9),9),3))
Operand #2 = ExpAvg(ExpAvg(ExpAvg(Close,9),9),9)

Here is how to build it: (TOP DOWN, in sequence, click or select as the windows appear)

Step 1 Go to the "Insert" Menu, Select "New Indicator …"
Step 2 Select "Arithmetic", Click "Next"
Step 3 Select "Add2", Click "Next"
Step 4 Select "Operand #1 =", Click "Set parameter", Click "Indicator …"
Step 5 Select "Arithmetic", Click "Next"
Step 6 Select "Subtract" ,Click "Next"
Step 7 Select "Operand #1 =", Click "Set parameter", Click "Indicator …"
Step 8 Select "Arithmetic", Click "Next"
Step 9 Select "Multiply2", Click "Next"
Step 10 Select "Operand #1 =", Click "Set parameter", Click "Indicator …"
Step 11 Select "Exponential Moving Average", Click "Next"
Step 12 Select "Exponential Moving Average", Click "Next"
Step 13 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 14 Select "Operand #2 =", Click "Set parameter", Type in "3", Click "OK", Click "Finished"
Step 15 Select "Operand #2 =", Click "Set parameter", Click "Indicator …"
Step 16 Select "Arithmetic", Click "Next"
Step 17 Select "Multiply2", Click "Next"
Step 18 Select "Operand #1 =", Click "Set parameter", Click "Indicator …"
Step 19 Select "Exponential Moving Average", Click "Next"
Step 20 Select "Exponential Moving Average", Click "Next"
Step 21 Select "Time Series = Close", Click "Set parameter", Click "Indicator …"
Step 22 Select "Exponential Moving Average", Click "Next"
Step 23 Select "Exponential Moving Average", Click "Next"
Step 24 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 25 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "Finished"
Step 26 Select "Operand #2 =", Click "Set parameter", Type in "3", Click "OK", Click "Finished", Click "Finished"
Step 27 Select "Operand #2 =", Click "Set parameter", Click "Indicator …"
Step 28 Select "Exponential Moving Average", Click "Next"
Step 29 Select "Exponential Moving Average", Click "Next"
Step 30 Select "Time Series = Close", Click "Set parameter", Click "Indicator …"
Step 31 Select "Exponential Moving Average", Click "Next"
Step 32 Select "Exponential Moving Average", Click "Next"
Step 30 Select "Time Series = Close", Click "Set parameter", Click "Indicator …"
Step 31 Select "Exponential Moving Average", Click "Next"
Step 32 Select "Exponential Moving Average", Click "Next"

Step 33 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 34 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 35 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished", Click "Finished

Now "Right Click" over the indictor name and rename it "TEMA 9".

I have sent up the files TEMA9.tpl and the RVI10.tpl. You will need to put these files in your "NeuroShell Trader \ Template" directory and restart NeuroShell if it is running. This will allow you to add the TEMA9 or RVI10 to one of your existing charts.

Once you have down loaded the files do the following:

Step 1 Go to the "Insert" Menu, Select "New Indicator ..."
Step 2 Select "Custom Indicators", Click "Next"
Step 3 Select "TEMA9", Click "Next", Click "Finished"
Step 4 Drag the "TEMA9(Close,Close,Close)" indicator over onto a trading strategy or a close bar chart.

Note: this is where you stop when just using the indicator "as is". To piddle around with it, continue.

Step 5 "Right Click" over the indicator name, Select "Modify Selected Indicator ..."
Step 6 Select "TEMA9", Click "Modify Indicator", Click "Reconstruct Original Indicator", Click "OK", Click "Finished"

Repeat for RVI10

I hope this helps.

Steve

Step 32 Select "Exponential Moving Average", Click "Next"

Step 33 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 34 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished"
Step 35 Select "ExpAvg Periods = 5", Click "Set Parameter", Type in "9", Click "OK", Click "Finished", Click "Finished

Now "Right Click" over the indictor name and rename it "TEMA 9".

I have sent up the files TEMA9.tpl and the RVI10.tpl. You will need to put these files in your "NeuroShell Trader \ Template" directory and restart NeuroShell if it is running. This will allow you to add the TEMA9 or RVI10 to one of your existing charts.

Once you have down loaded the files do the following:

Step 1 Go to the "Insert" Menu, Select "New Indicator ..."
Step 2 Select "Custom Indicators", Click "Next"
Step 3 Select "TEMA9", Click "Next", Click "Finished"
Step 4 Drag the "TEMA9(Close,Close,Close)" indicator over onto a trading strategy or a close bar chart.

Note: this is where you stop when just using the indicator "as is". To piddle around with it, continue.

Step 5 "Right Click" over the indicator name, Select "Modify Selected Indicator ..."
Step 6 Select "TEMA9", Click "Modify Indicator", Click "Reconstruct Original Indicator", Click "OK", Click "Finished"

Repeat for RVI10

I hope this helps.

Steve

Strange effects when adding/removing chart pages

Date :2/19/2002 5:32:57 PM Poster : Andy Bower

I'm using NSDT and experiencing (what I consider to be) some strange effects when adding and removing pages in a chart. I created a chart based on CTXS with a NN predicting 1 day optimal % change in open. I'm using Parameter Search and I then run this into a trading strategy with the following results:

CTXS Optimal 1 yr Return 374%
CTXS Current 1 yr return 143%

The NN is getting an OOS 1 year return of 79%.

So, I look at the trades and these seem pretty good, so I think about whether there are other issues that will work with this arrangement. After some hit and miss I come up with AMZN and (less so) XRX which give:

AMZN Optimal 1 yr Return 490%
AMZN Current 1 yr return 110%

XRX Optimal 1 yr Return 147%
XRX Current 1 yr return 53%

So I try and look for some more issues. I decide to run all of the NASD100 stocks through in batches based on their first initial letter (i.e. all As, all Bs etc). I save the chart as NASDA and load up all the A stocks, deleting the originals CTXS and XRX. I then rebacktest and optimize the net and the trading strategy.

I do this for NASDB and NASDC too. All the other parameters are identical (as far as I can tell) to those in the original chart. However, I notice that the results for CTXS is now very different:

CTXS Optimal 1 yr Return 342%
CTXS Current 1 yr return -67%

I can't see why this should be. From my experiments, it seems that if you remove the original page from a chart it fundamentally changes the way the optimization for Nets and Trading Strategies work. If you add the original security back in then you don't get back to the original situation either.

Can anyone throw any light on this?

TIA.

Re: Strange effects when adding/removing chart pages

Date :2/20/2002 8:53:38 AM Poster : Texas Bubba

I seen this too, but I figured out why. If you have your quote.com feed on some more data probebaly came in the mean time. Then you optimize again and everything has moved forward a tad or maybe more than a tad if your doing this the next day. So now trades start at slightly differnt times and values. The way to avoid it is to not backtest to the end of the chart. Put in a pecific stop date, or turn off your data feed.

Locking indicators parameters in optimizations

Date :2/23/2002 10:17:23 PM Poster : Steve Kratochvil

I wish to show you how to take clean meaningful indicators and provide them directly into any chart as data. This will have the effect of locking the indicators parameters. Locking "selected" indicators parameters in a Parameter Search or Full Optimization is not a feature in NSDT. Indicators output as data and inserted as inputs are not optimized as the other indicators are. Why would someone do this? Because we know that there are some things that are set in stone even though we do not have good explanation for it. Several Laws of physics fall into that category. We just accept them as fact and build on them because they have proven to be correct time and time again. At times in our normal every day life we take inputs at face value and use them as the constants for other decisions that are an interpretation of all the inputs. The same thing is true of the NSDT. So here is how to do things along those lines. Setting the optimization to Parameter Search or Full Optimization does not change any of the data elements like OHLC or Volume, everything that is created by the indicator wizard is fair game for optimization. That is a necessary feature in your study of your system. You need to do full blown tests as well as No Optimization at all, to try and glean all the information that an expert system is providing. Once you have an indicator that you see as producing consistent results no matter where it goes or which stock you put it on then you would want to "lock it down" and do not let the optimizer try and guess for a better solution. Sometimes you might have an indicator that needs to "stay the course" and not over fit temporarily with the current blip on the radar. Your indicator might be based on sound mathematical reasons and should not be changed. The TEMA I mentioned in an earlier post is just such an indicator. Now in that indicator one setting is the multiplication buy 3 this is not an input setting, the number three is formula structure and should not be changed. If it does change then the indicator is destroyed and meaningless to the optimizer. Here is how to lock in any indicator's output so that it can be used in an optimization. We will need to move the output from "indicator" to "data" and then present it to the optimizer.

Step 1. Build a directory named Indicator Data that you will use to keep you indicator data. Example: "C:\NeuroShell Trader \Data \Indicator Data"

Step 2. Export the indicators as data. Go to the menu "Tools" then "Export Chart/Data ...". In the popup window the default option of "Chart Data Values" is selected as well as "File". Click "Next". Now click the button "Add Data Item(s)...". The indicator wizard will popup. Scroll down to your indicators. Select all the indicators that you wish to remain "locked" and click "OK". Click "Next". The default option of "Comma separated ASCII file" is selected. Click "Browse ..." and locate the directory you created (See Step 1). Now change the name of the export file to "Indicator Data.csv" and click "Finished".
Now you have an export file that you are going to use as an input.

Step 3. Setup Data Sources for the new directory and file. Go to the menu "Tools" and select "Data Sources ...". In the popup window click "Add Directory ..." and locate the directory you created where you saved your export file (Indicator Data.csv) Click "OK" and then click "OK" to finish.

VERY IMPORTANT NOTE I: Anytime you delete a file from this Data Source directory you will need to close NSDT and reopen it to reflect the change. This is to prevent you from getting "Run-time error '9': Subscript out of range" when you try to "Auto Scan" that directory for the change. This is an error that comes just from improper handling of the fact that the file no longer exists and needs to be removed from the list and insert reference. This error has no bearing on your chart data and is generally harmless unless you have not saved your work on the chart in a while. The error will crash NSDT.

Note: Leave the Category for this new Data Source directory as "Miscellaneous Instruments".

Step 4. Insert the Indicator Data into your chart. Go to the menu "Insert" and select "Other Instrument Data ...". You will see the (Miscellaneous Instruments) category now as a possible selection. Select (Miscellaneous Instruments) and click "Next". Select the "Indicator Data.csv" file you created and click "Next". You will see all the indicators listed and ready to be selected and placed into your chart when you click "Finish"

VERY IMPORTANT NOTE II: This is the only way that I know of to keep some indicators parameters locked and let others be optimized. This is the approach that I use for my inputs into my nets allowing me to provide rock solid inputs and let the Neural Net figure out the best trades. Then after I have an optimized Net that is good I take the settings that the optimizer found for the Net and copy them down. I then delete all the indicators data that I brought in because the next day's action will not be in the indicator data. I guess having two similar charts would be a better idea. You could have one for optimizing the Net and then the other that you trade with. I then enter the Net settings manually into a trading strategy with No optimization. I provide the actual indicators as inputs so that current new data is provided to the Net by the indicators in real time. This way the net will respond to the indicators much more accurately and more in line with your logic for using some parameters. I hope this helps.

Steve

Re: Locking indicators parameters in optimizations

Date :2/24/2002 8:29:07 PM Poster : Webmaster@ward.net

Actually, there are two other ways to lock some parameters and optimize others, which we think you'll find easier. In any case, the methods below will allow the indicators to be used in real time too.

First is to just save your indicator as a custom indicator, and while doing so hide the parameters you want to lock. Then they can't be changed or optimized.

Another way is to set the min = max of the parameter ranges of the parameters you want to lock during optimization. The parameters will be locked at the value that min and max are set to.

I am back to my first explanation for the "indicator to data shuffle" to lock the parameters on the indicators that have a password on modifying them. If you have any ideas, I am open to them.
I must confess, I can import any data known to man now. I could even take abstract data into a system if it could be quantified as numbers or a number over a sequence of time.

Steve

I too have found these to be very useful and I'd like to offer my thanks as well.

One thing that I would also be interested in is getting an insight to others workflow processes.

An area that I have struggled with is giving some consistent structure to developing a trading model and feel that I have not got much beyond trial and error. I'd really like to feel that I'm getting in control believing that a more rigorous approach would help get me on track.

It feels that this might form 2 parts the logical workflow itself and some form of file/reference structure for the charts that are developed along the way.

So any thoughts on this topic would be really welcomed.

Regards

John

I'm pretty much fixed now on what I'm doing, but back when I was tryin different stuff, I found the best thing is to seperate my methods. We cowboys are very organized. So I had one folder where I keep charts with regards clustering indicators, and one where i keep the neurel indicators stuff. Then I'd always name my charts something what described it like "SPY cluster3 with price momentum.chf". Then no way I'd forget later what was I doing at the time. You have to be careful to throw out charts that are goin no where or else your folders get cluttered up to where you don't know where your at.

An area that I have struggled with is giving some consistent structure to developing a trading model and feel that I have not got much beyond trial and error. I'd really like to feel that I'm getting in control believing that a more rigorous approach would help get me on track.

It feels that this might form 2 parts the logical workflow itself and some form of file/reference structure for the charts that are developed along the way.

So any thoughts on this topic would be really welcomed.

Regards

John

Hey Bubba, I wish to digress on the work you have done with clusters. I see them as a panel of experts on steroids. What have you done with them?

Steve

Now hey I do agree with how you put that! The clusters been very good to me, but there wasn't nothing to it. I just used the little critters like the examples said to. You just put them in that A<B cause your looking for if your bar now is close to where your buy bars hang out or close to where your sell bars hang

out. You do have to experiment a tad to make sure you find the stuff that likes to get together right before the S&P goes up or goes down. The stuff Steve Ward said to use in the class was pretty good, but some other things works for me maybe a little better, like some combinations of maximum and minimum value put onto spreads and also number of bars since high or low occurred.

I just would like to point out the all of us need to watch our typing. I noticed that one of my posts wiped out and it was the <'B' portion of the indicator that is also an HTML Tag for Bold. Here is a safe way to state the indicator 'A'<'B'. I have made the adjustment in your post below.

Now let us continue with the Min Max thing you have going on and number of bars. Why did you chose these indicators?

Steve

I used those cause I figured I should be finding the highs and lows in a backwards window of my spreads. Now I just let that optimizer run a tad and find out how big of a window we should be lookin thru. So i find out how big or how small the spreads got to be, plus how long ago they was. Then i turn on them cluster critters you say is on steroids!

Psychological Line and KST

Date :3/5/2002 11:04:52 PM Poster : Steve Kratochvil

I have two more indicators that might be of some use. Psychological Line and KST. I have seen the KST in several books so I thought I would look into it. I have included a chart in 1min Bars and Daily Bars. I don't know how useful it is yet so here it is.
Now the Psychological Line I have not quite figured out how I might use it so I will talk about it for a bit.
I am a Day Trader and spend time at both ends of the spectrum to see what is going on. I look at all the conservative investing methods and include them in my plan because they are valid as the masses move in unison with them. I look to see if there will be action playing on a good stock. I do this by backing out to a Monthly chart and if it is over bought in the stochastic or the MACD 6,28,11 makes a cross over in the Daily the common trading strategy will play. I look at others as well mostly all the common trading methods. Point being I am looking at the indicators that thousands of people use to make decisions and anticipate the move. It is not that hard. In addition these trades are more than likely valid as the masses fuel the trend and cannot be stopped. This has a way of self-predicting. With out the indicator the stock would not react on these few days. The fact that the stock is not going anywhere means nothing. They see the indicator and react, which self-fulfills the indicator and makes the indictor work to validate their trade. They all have the same technical manuals we do. We just have several that they do not. Another example is If a stock crosses a 200 day moving average or the 50 day moving average etc... This puts some investors in motion. At these events you can expect things to lean one direction during the day. At any given point those investors decide to invest or clear their position. So they zoom in to a 15, 10, 5, or heaven forbid 1 min chart and see something that they cannot comprehend because it is (in their terms), "It is crazy and uncontrollable." So they say, "Just watch it for a little bit and execute if it turns the wrong way." That psychology is pure fear and greed. I found an indicator that might have some value and interpreting this shock and trade mentality on these few trading days. The indicator seems to give you the perception value of what people might think while looking at the price action for the first time. I don't know if this indicator has any merit or not. I found it at the following link:
http://www.fmi.com/studies/combinestudies.htm
I then made an indicator Psychological Line.tpl that you can place in your NeuroShell Trader template directory allowing you to insert it from the "Custom Indicators"

I sent the files up for both the Psychological Line and KST.

Steve

How to determine the previous value of an indicator

Date :3/6/2002 1:17:29 AM Poster : Matt Blaes

The answer to this may be obvious, but I can't figure it out.

How do you have a trading strategy go long when an indicator's current value is greater the indicator's previous value, or go short when the indicator's current value is less then the indicator's previous value?

I've looked through the help for a "previous" indicator or something similar but I can't seem to find one that'll work.

thanks,

Matt

Re: How to determine the previous value of an indicator

Date :3/6/2002 12:20:59 PM Poster : Steve Kratochvil

Click "Insert - New Indicator - Relational - A>B"
Set A = Click "Set Parameter - "Your Indicator Value"
Set B = Click "Set Parameter - Indicator - Basic - Lag"

Set the Lag values
Time Serise = "Your Indicator Value"
Periods Back = 1

That will do it. A<B for the other direction.

Steve

How neural nets work vs indicators to use.

Date :3/6/2002 1:58:24 PM Poster : Dale

I am a newbie at neural nets, but if I am understanding the way that Neural Nets train, they look for patterns in back data and project those patterns to predict future price movements.

If this is the case, then it seems to me that indicators that buy/sell on breakouts (i.e. CCI) or indicators that might liquidate positions on overbought/oversold (i.e. ADX) would not be of much value to a neural net. On the other hand, indicators like moving averages (but not crossovers), cycle analysis techniques, and perhaps some volume indicators would be much more useful.

Is this correct? Or where am I going wrong?

Thanks,
Dale

Re: How neural nets work vs indicators to use.

Date :3/6/2002 2:37:44 PM Poster : Steve Ward

Don't worry, there's rarely a right and wrong. There's only the Golden Rule of neural nets: do whatever works best! So I'll respond to this from a strictly technical neural net point of view. I'll let others respond with respect to trading efficacy. My feeling is that breakouts are ok as long as the indicator is giving you the distance between the current time series and the one you are looking for it to break out of, as opposed to a binary signal that it's broken out or it hasn't. I think CCI does that. On the other hand, I can't see what a moving average gives you at all by itself, unless it gets compared to the price or another MA, etc. So instead of feeding in several MAs and prices, and letting the net try to figure out that it should compare, I'd rather feed in the spread between two moving averages, or one MA and a price. That way you give the neural net the advantage of your experience. Your clues let the net stand on the shoulders of giants. On the other hand, I'd let the optimizer find the appropriate averaging periods.

Re: How neural nets work vs indicators to use.
Date :3/12/2002 4:35:16 PM Poster : mstigall

Neural networks are pattern matchers... but they're also generalizers. So I thought I'd add two points (pardons, Steve).
1) The output of the neural network will never be "exact" - its always a general direction or trend. An analogy is the windsock at an airport; shows direction great, but doesn't give any indication of windspeed.
2) The neural nets can memorize patterns, and that's usually a bad thing. Since the pattern won't repeat in exactly the same way every time, you want the neural network to generalize the pattern to something it can recognize (hopefully in sufficient time to do some good trading) in later time periods.

On 03/06/2002 2:37:44 PM Steve Ward wrote:

My feeling is that breakouts are ok as long as the indicator is giving you the distance between the current time series and the one you are looking for it to break out of, as opposed to a binary signal that it's broken out or it hasn't. I think CCI does that. On the other hand, I can't see what a moving average gives you at all by itself, unless it gets compared to the price or another MA, etc. So instead of feeding in several MAs and prices, and letting the net try to figure out that it should compare, I'd rather feed in the spread between two moving averages, or one MA and a price. That way you give the neural net the advantage of your experience. Your clues let the net stand on the shoulders of giants. On the other hand, I'd let the optimizer find the appropriate averaging periods.

On 03/06/2002 1:58:24 PM Dale wrote:
I am a newbie at neural nets, but if I am understanding the way that Neural Nets train, they look for patterns in back data and project those patterns to predict future price movements.

If this is the case, then it seems to me that indicators that buy/sell on breakouts (i.e. CCI) or indicators that might liquidate positions on overbought/oversold (i.e. ADX) would not be of much value to a neural net. On the other hand, indicators like moving averages (but not crossovers), cycle analysis techniques, and perhaps some volume indicators would be much more useful.

Is this correct? Or where am I going wrong?

Thanks,
Dale

grouping charts
Date :3/8/2002 4:22:12 PM Poster : Steve Klopfer

I always have the same charts open at the same time. Does anyone know if there is a way to save a page containing all my charts so that I can just open one page and load all of the charts at once?

Re: grouping charts
Date :3/10/2002 9:11:10 PM Poster : Steve Kratochvil

Not that I know of. Each chart is more complex that just a few settings. Each chart is like a Word.doc with all the extra stuff like formating, macros, vba etc... You don't load word.doc's like that because of the file design and the way they work. That does sound like a good feature. Something like a recall button that had a list of files you created that can be loaded all at once. You need to be careful as some complex charts run fine after they are up but the first load is tough.

Steve

Take a look at the user tip on this site called "Running the NeuroShell Trader with Macros". From what we understand from the user, we think you could build a macro that loaded all your charts with one macro.

Chande Momentum Oscillator
Date :3/10/2002 9:12:17 PM Poster : Steve Kratochvil

If anyone is looking for Trend Vs Range indicators and wanted to use the Chande Momentum Oscillator, I have created a tpl for a 12 bar version of it. I called it the CMO12.

I have sent up the file CMO12.tpl that you will need to place in your template directory and add it from "Custom Indicators"

Steve

Re: Chande Momentum Oscillator
Date :3/11/2002 1:08:56 PM Poster : Steve Kratochvil

After some testing of this indicator with SMA9 of CMO12 and EMA3 of CMO12 I have buried my processor several times. This indicator needs to be written into a dll.

Re: Chande Momentum Oscillator
Date :5/28/2002 2:07:45 PM Poster : Jacobs

Yes, this is understandable.
I downloaded the tpl and found it has 385 (sic!) parameters and I can't even
read/reconstruct the formula in the tpl editor (I guess the formula is too large for
the tpl editor!??)

Several time frame
Date :3/11/2002 4:09:34 AM Poster : claude

Dear all,

I'd like to share with you an idea that seems to work for me.

I usually use 5 minutes bar charts and of course I use Fuzzy, clusters, and other NST adds-on. But recently I tried to use several time frame for the same indicator. I give as input 4 different stochastics %K (half an hour, 1 hour, 5 hours and 5 days). I calculate the number of 5 minutes bars necessary to represent the time frame (i.e.: 5 hours is represented by 60 bars).

So I have %K(6), %K(12), %K(60), %K(460). My idea is the following, if all the stockastics are under 20 (or above 80) then I increase the chances to be in a good configuration. I let NST to find the best values of each indicator which are allowed to vary from 4 to 7, from 10 to 14, from 50 to 70 and from 450 to 470.

The result is quiet good and I'd like to know if someone has already used several time frame for an indicator. Am I doing something totally strange? Or do you think it could be an idea to pursue? I just think about Steve Ward's words "There's only the Golden Rule of neural nets: do whatever works best!".

Thanks for all comments.
Claude

Re: Several time frame
Date :3/11/2002 10:55:28 PM Poster : Daniel Revah

The idea should work even better if combined with moving averages crossover for example, as oversold can continue to be more oversold same with overbought so i would be careful of extended runs. However with the moving average concepts incorporated you should improve the stategy.

good luck and let us know.

DR

When optimization is really slow
Date :3/11/2002 1:38:37 PM Poster : Olli Myllynen

Dear all,

I want to raise my objections to the guidance given on optimization and the trailing stops in tips and examples section.

Trading futures without stops is outright dangerous. Any trading system package should therefore be fully capable of testing stops also to be seriously taken for futures trading.

Furthermore, the "oldfashioned" stops are more than just insurance. I have had the NST Professional for two years now during my 12 years as a trader. I have not seen many neural nets, which does better job than chandelier exit, yo-yo exit and initial stop loss combined in trending futures, like the currencies. There are also other alternatives. It is fairly easy to produce nets giving good timing in entries, but far more difficult to make nets, which are good on both entries and exits.

My partial solution to the notorious speed problem has been to code the parts I need in to DLLs using PowerBasic - unfortunately there seems to be a PowerBasic memory leakage problem included. (This restricts ones selection of OSes - you are stuck to Win98 or ME which can free up the unused memory, while the M3 Data Server requires NT or better which cannot - so no daytrading yet)

I am making money with my approach, and I want to have the freedom to develop the ideas my way. I think this is what the NST should be intended to do. The reasoning given in the tips section is more like an excuse for something which should be able to be handled better in the NST.

All this said, I am still mostly satisfied with the NST. I just do not like an approach where an important thing is turned into something one should avoid just because the application cannot handle those situations well enough. There should be more pressure towards the programmers to find out ways to make this important feature more usable.

To the wishlist I would also include better handling of portfolios. Now if we would see that in NST, I would be exited!

Olli

Re: When optimization is really slow
Date :3/11/2002 5:03:18 PM Poster : Steve Ward

Since I was behind that tip, I'll answer your objection. We never said that stops shouldn't be used. We just proposed the argument that they probably shouldn't be optimized. I stand behind that statement, because I still think it is better to optimize a strategy to make the best decisions it can make without stops. It shouldn't learn to use stops as a crutch instead of learning how to make proper trading decisions. The crutch keeps it from finding more profit the "right" way. Get a trading strategy that makes the right entry and exit decisions. Then the suggestion is, put the stop on with your broker in case your model falls apart later. However, as I've said many times before, there are no absolutes in this game and it is certainly appropriate for you to disagree with any guidance we give, and ignore as much as you like.

Moreover, we don't agree that these particular types of indicators are improperly programmed. We mentioned how they are in a sense "recursive", which means at each step geometrically more processing is required than with a normal strategy. On the other hand, there may nevertheless be ways they can be sped up, and we have been investigating such possibilities.

Finally, we fully expect PowerBasic to fix their memory leak, and even if they don't we'll probably offer alternative solutions. PowerBasic is our "Easy Language" and it is much too important to be overlooked.

PS - I haven't noticed any our our PowerBasic users adding to my post on the PowerBasic forum. Why don't you let them know you think it should be fixed too?

Steve,

I appreciate the work you have done by letting us have the NST. I just want to give you my input in something which may deserve an attention, and not to let you think this problem/feature in NST is not important, as you hint in the tip.

With regard of stops I think differently than you. And the software I use has to allow this.

Your approach to stops is clearly - as you said yourself - one of insurance. There is nothing wrong here. However, I want to use stops in an other way. In many of my systems they are the exits. No other exits are used. This approach is often much more profitable and less riskier than the neural net signals for exits. Furthermore, the stops kick in during the action, not reacting after the fact.

When my risk is limited and I know that, this allows my money management (ie. bet sizing) scheme to take more contracts, thus increasing my profit potential.

Most often I use the neural signals as setups, and the entry is triggered by other means. I still rely on the neural nets, but they are not everything. Important, yes.

Optimizing stops is just as important than optimizing anything else. If one does it wrong, it is just as deceiving than optimizing anything else. Still one should be able to do this, if one wants to. I want to. I need to. I do not believe in having similar parameters in all markets. So optimizing a trading strategy often requires optimizing stops, too. But one has to use one's head here, not just to let the computer churn.

If the code is already clean and fast around optimizing, then there is not much else to do than to get the fastest processors available. I am still a bit suspicious. I have hard time to accept that for a 2000 GHz P IV processor with 1024 MB memory and the fastest motherboard and HD in the shop it takes all night in optimizing a couple of parameters. If you can take a look at the code of optimization, then at least you know there would be someone appreciating it.

About PowerBasic - yes, I think I will support you there.

All in all, NST is a great tool.

BTW, if anyone wants to take a closer look at the kind of stops I mentioned as examples in the original post, take a peek to http://www.traderclub.com/discus/board.html , under the section "Bulletins" there. Chuck LeBeau has made some remarkable work public for everyone to see for free.

What "Exit Indicators"?
Date :3/12/2002 1:14:01 PM Poster : Kenny

Your recently posted Tip and Techniques comments on speeding up optimizations suggests using indicators in Trading Strategy: Exit Indicators. My version of NST 3.5 doesn't include such a category. Is this a indicator category found only in the day trader version? Or is it a misprint?

What "Exit Indicators"?
Date :3/12/2002 3:34:23 PM Poster : Webmaster@ward.net

We should have said Trading Strategy: Exit Signals. We'll fix that.

On 03/12/2002 1:14:01 PM Kenny wrote:

Re: What "Exit Indicators"?
Date :3/12/2002 5:34:00 PM Poster : Webmaster@ward.net

It isn't unique to the DayTrader. If you're entering exit conditions and press the indicator button, it's right at the top (easy for the eye to skip over). You should also be able to see the category if you just insert a new indicator with the Indicator Wizard. If you still don't see if, you'd better contact tech support.

PowerBasic leakage problem workaround
Date :3/21/2002 8:53:27 AM Poster : Webmaster@ward.net

PowerBasic has posted a workaround for the memory leak in their DLLs:

http://www.powerbasic.com/support/forums/Forum2/HTML/000036.html

They have also promised to fix the problem in future releases. So if you are getting out of memory problems in NeuroShell when you optimize, and you have DLLs written in PowerBasic, put this workaround in your DLL.

Re: PowerBasic leakage problem workaround

Date :3/22/2002 5:20:07 PM Poster : Steve K

Thanks for the work around from Power basic. I've got a few custom dll's I can use it in
However, I've downloaded a bunch of DLL's from this website. Were these compiled with Power Basic?
If so, won't they need the fix applied and have to be recompiled?

Also, Since memory is so cheap now and the biggest limiting factor in NSDT is processor speed, wouldn't it be better to leave the DLL's in memory,
at least till it's done optimizing vs constantly loading & unloading them? Might speed things up a bit. What percentage of processor utilization
is consumed in loading & unloading?

btw, there's a 14 million dollar Cray super computer for sale on ebay -- it's bidding $4500, no reserve!!!
I suppose you could run some nice nets with that beast

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2010929976

thx, Steve

NST study materials

Date :3/21/2002 11:53:03 AM Poster : Dan Kinter

I am a NST newbie. I have assembled, and am systematically going through (usually repeatedly) , the following NST materials for study. Once I have gone through all of the materials - including practising all of the examples - and then organizing and prioritizing the ideas I have developed along the way, will I begin my "exploration":

The materials are:

1. Manual - (I have printed out the entire "Help-Contents" file and organized it into two binders)
2. Videos
3. AI Course
4. Ward.net site (printed out all topics which appear helpful and put them into one binder and then copied the entire Discussion Forum postings/responses into Word and then printed them out and placed in a second binder - about 200 pages)
5. Indicators - organized all indicators into three binders - indicators are divided into categories - obviously I'm not going to "study" the indicators, as such, but use the binders as a handy reference source

Does anyone have any other ideas or other suggested materials for me to consider? Thanks. Dan

Re: NST study materials

Date :3/21/2002 9:47:45 PM Poster : Steve Kratochvil

Well, Dan that is what I did and it seems to be the best approach. You will be well grounded and ready to translate your ideas into system after a little while. The next best thing, that I think might be of use, is this forum. I check here everyday and look to see if anyone has mentioned anything worth looking into. I have also tried to contribute here on the forum to everyone by giving them parts of work I have done. I explore the other ideas if they seem logical etc... It sounds like you are off to a great start. One thing that I might offer is this. Start with indicator first. The better the indicator the better the net will be.
I am hopeful that I will be able to start sharing high quality information about Nets in the coming days.

Steve

ANM artificial neural mesh

Date :3/22/2002 6:52:41 PM Poster : albertl

Hello,

Some people claim that this NN technique (ANM) is able to adapt the NN net structure itself to temporal data , this type of learning is supposed to do something much more drastic and efficient than just changing the weights of the neurons.

I wonder if s such a technique is really existing.

Has any of the NST´s add ons similar features or ihas Ward Systems
something similar up the pipeline?

albert

Meshes

Date :3/22/2002 7:12:20 PM Poster : Dale

Does Neuroshell uses "Meshes" or is there an add-on that will use them. From my research I understand that meshes are a superior neural net technique.

Thank You,
Dale Felber

Re: Meshes

Date :3/25/2002 8:44:31 AM Poster : Steve Ward

There are literally hundreds of different types of neural nets, and each has its advocates as well as the original developers who understandably hype their art. Year after year some new type gets its 15 minutes of fame. To date the most completely unbiased and credible study I know of was done several years ago by the National Institute of Standards and Technology (NIST) in which they declared Probabilistic Neural Nets (PNN) the best classifiers available at that time (at least on the databases they tried). That is one reason we included PNN in the NeuroShell Classifier and the Adaptive Net Indicators addon.

The truth of the matter, though, is that what you feed nets is probably several times more important in the financial arena that what type of net you use. That's because, unlike in science, there are far too many variables moving the markets to capture them all. None of the hundreds of variations of neural nets (including ours) is going to be a panacea when it comes to predicting markets. If you get the right indicators at the right time on the right issue in the right way without overfitting, almost any good net paradigm will do well. That's why we like Turboprop2 - it's fast enough to build thousands of nets in a relatively short time during optimization.

What is the formula for CMO (Chande Momentum Oscillator) ?

Re: CMO

Date :3/26/2002 9:40:39 AM Poster : Steve Kratochvil

Reference "Technical Analysis from A to Z" by Achelis. He did a great job with this book. I have not got around to building a DLL for it because it is a beast and will bring you system to a halt if you are not careful. I put it togeather just to take a look at it.

Su = Summation of all the Up bars over your desired period.
Sd = Absolute Value of the Summation of all the Down bars over your desired period.

The formula is very simple (My kind of indicator):
(Su - Sd / Su + Sd) * 100

The indicator tpl that I sent up to the forum is based on a 12 bar period. I will convert it to a dll that will allow different time periods when I wish to really beat the thing to death and evaluate its merit. I am programming other dll's at this time and fine tuning my system. I hope I have been of some help to you.

Simple Line in the Sand Strategy

Date :3/29/2002 7:27:03 AM Poster : ghkramer

Your strategy is called a turtle. The simplest strategy that I've used is to enter the market based upon a random number generator (e.g., Buy if RandomNumber > x) and exit using money management techniques (stop loss and an adaptive trailing stop such as a volatility stop). I found that this will out perform many indicators.

Re: Simple Line in the Sand Strategy

Date :4/1/2002 1:46:50 PM Poster : RiskArb

Can you tell me briefly, how to set volatility based stops in the Trader Pro?

Re: "Is it possible for you to post this strategy as a downloadable file?"

Sorry. I can't seem to copy and paste any equation in NST. I manually copied it onto paper (its been years since I had to do that) and typed into the forum. They must be using their own homebrew editor because most of the existing components that people use in MS Windows software development allow the user to cut and paste.

The equation is just nested functions. You have to do a lot of clicking, scrolling, and clicking to insert all the functions from left to right. Sorry, thats just the way the program works.

Open Interest

Date :4/1/2002 2:58:32 PM Poster : Maciej

Hi there,
In futures quote.com gives the "open interest" value. This is available on the day bars and always lags by one day. Is there any way that I can get this value within NST without resorting to DDE/DLLs etc?
Maciej

Re: Open Interest

Date :4/2/2002 4:01:41 PM Poster : webmaster@ward.net

It was not included by our programmers as they built the quote.com interface since it was originally built for intraday, where it is not available as you point out. When we opened it up for end of day bars, it could have been included, but wasn't, and probably should be included in the future. There's no way to get it from Quote.com (unless Qcharts will export text files as we do), but if you have it from somewhere else, you could include it as a text file with the same ticker symbol. That data is included with other daily formats, like Dial Data.

Development wish: Bet size selection ie. contracts to trade

Date :4/4/2002 3:35:58 AM Poster : Olli Myllynen

NST is naturally more weighted into neural nets, but the trading strategy section is good also, especially the genetic optimizer. As always, there could be some additional features available. This one should be fairly easy to include.

Currently the trading strategy/prediction settings allow one to use only a few predetermined settings to define the number of contracts (or shares, if one prefers stocks).

I would like to use my own bet size selection in trading strategies. Would it be possible let the user to define the number of contracts through a DLL?

This way one could use what ever bet size selection/money management approach one wishes in trading strategy.

Olli

mesa cycle software

Date :4/4/2002 8:14:47 PM Poster : davide accomazzo

I own John Ehlers MESA2002 indicators for NSDT and have been messing around with them. I am interested in your approach to your oscillators and stochastics. What I have found is that the MESA2002 indicators do work as expressed. My only major issue with them, at this time, is performance intra day. It is so bad that the recalculation actually caused me slippage of about .10 to .20, which is $100 to $200 per trade on a $250 to $500 target scale. The only way that I compensated for this was to eliminate all the MESA indicators I had except for one that seemed to help the best. That was even bothersome. So I have put them on the End Of Day Trading shelf for that approach. If you are an End Of Day trader then you will not notice the performance hit. I have read John Ehlers book Rocket Science For Traders where he goes into detail on MESA indicators and have seen how they can be used. If you don't have this book it is worth the read for understanding how MESA ticks. I have even use the MESA as inputs to the Fuzzy Logic indicators. One thing that might be of interest to you and your oscillators or stochastics is the Fuzzy Logic indicators. With Fuzzy Logic you can determine the shape of the indicators that you already understand and have sound reason to use. I use Fuzzy because it gives me more than just crossovers or penetration lines of the same indicators that I have grown attached to. The knowledge that oscillators or stochastics work to indicate conditions of a stock or market is common and accurate. The interoperation of these is where it all breaks down and confounds the masses. MESA looks good and it seems to be in a class all by its self. It is both an oscillator and a stochastic, at the same time it is neither. It is designed to determine when you are in a trend or a range(cycle). It seems to be able to do that. Like I said the performance hit eliminated it from my system so I have limited actual experience with it.

Re: mesa cycle software

Date :4/11/2002 12:54:15 AM Poster : Steve in California

I'm a novice at thinking about Mesa, but I have spent a good number of hours working through the Rocket Science text and looking at the Sinewave indicators plotted against a time series. Here's how I think about it:

1 During what Ehlers calls cycle mode, there are fewer false breakouts with the Sinewave indicator than with traditional oscillators.

2 Ehlers clearly states in his book (and I agree) that the transition from "cycle mode" to "trend mode" and from trend to cycle isn't identified well in Mesa.

If I understand the points made by David below correctly, the value of Mesa is different than what he's looking for. 1) Mesa isn't going to find more cycles than traditional oscillators, it's going to find less and this is a good thing (i.e., false oscillator breakouts are avoided during cycle mode. 2) Mesa isn't going to help avoiding "ob/os signal when trending", in fact, my opinion is that oscillators for this are better.

I've been looking at Mesa indicators within Tradestation and don't have all of them as dlls for use with NSDT.

Finally, regarding Mesa and how to think about it: it's on my mind that Ehlers (and Mike Barna) have several systems on the top ten systems lists that FuturesTruth keeps through its audit process, each of them doing more than 100% per year for several years. In his "developer interview" with FuturesTruth, Mike Barna says that the "technology [i.e., R-Mesa] combines elements of MESA and R-Breaker" and that this technology is "well know and mature". It seems to me that this is further confirmation of what my own view is: namely, that Mesa cannot, by itself, drive a profitable strategy but must be combined with other indicators to overcome its major weakness (i.e., not being able to distinguish early enough between trend and cycle modes at the transition periods between them).

Predicting Options

Date :4/10/2002 1:59:36 AM Poster : Mark Simpson

I've created a DLL function to model a continuous option series based on a stock price, and I now want to create a prediction based on the data I've calculated, rather than the stock price.

I can create a prediction based on the calculation, but the calculation is incorrect, because the trading points are placed on the closing price. I also need to do it in realtime, so exporting and then importing isn't an option either.

Effectively, I want to replace the "Closing Price" with "My Own Calulation Of The Closing price".

Has anybody got an ideas?

Thanks

What would you do?

Date :4/11/2002 5:09:38 PM Poster : sfrobins

What would you do if you developed a trading strategy with NeuroShell Trader Professional that was correct %80 of the time, and was returning giving you an average return (on paper) of about %10 per week, trading stocks; and you had NO MONEY to invest.

Suggestions?

Thanks,

Stewart

> > One thing about this is that it is time consuming. I optimize every night to adapt the strategy to new market conditions. I don't know if this is absolutely necessary, but it does yield fairly consistent results. If I were to limit the data, set, perform the optimization, and then test it against additional data added to the data set, one day at a time, it could take a very long time to get through a year's worth of data. In other words, I don't have much of a time range to test out of sample, because I am always optimizing on the most up to date market data that I can get. The test out of sample is the trade I make on paper tomorrow based on any signals that I get after optimization. I understand data normalization, training, and testing issues for neural nets; I am finding that the strategy is most efficient immediately after optimization, and performance degrades as time progresses (and theoretically, market conditions change). Therefore, I optimize using the latest data I can get.

I just cannot resist your question. Better judgment is nagging at me in the back of my head. I do feel that your question it is a bit leading or fishing. So in light of the fact that the true question you are asking is not given I have these things to say.
If you are trying to get someone to fund you. We have all worked very hard to get where we are, even if it bankrupt, so please do not ask us for money.
If you are trying to sell it. I have four charts that produce 100% and 30%+ return on Day Tradable stocks.
If you are truly asking for advice. Here is my two cents. If you believe in your system and it has proven to make money after solid testing then work to save $30,000 over the course of this next year. During this time let your system run and prove to you that it is going to work. After you have this small sampling of your system and everything is as it should be, then you should commit all of your hard earned resources to your system with confidence that it will work. That is what I did.

So how do you answer your own question?

Steve

Hello Steward,
Arent you able to put your system in a few custom indicators and sell them or lease them to NST customers ?

Or come to Luxembourg on a holyday and teach me trading for a while ...

all the best to you
albert

Now, that is something can relate to. I am also a software developer and also saw my worst economic downturn when I got divorced. It was a rough and turbulent time. It was from that moment that I started really reaching for my goals and thus far I have reached all of them. I can also relate to using your rent money. I remember one instance where I did not have any food for three days until payday. I know when the chips are down. So, I understand, more than you know. Forgive my abrupt posture, but your question was a little cheesy. I am now feeling bad that I almost berated you. I should have listened to the little nagging voice.

data errors...

Date :4/12/2002 9:22:44 AM Poster : Stewart Robinson

I own three copies of Neuroshell Trader Professional, so that I can run optimizations in parallel on three separate computers. I have noticed over the last year that if the same strategy is optimized on different computers for the same ticker symbol, I get different results. I have tracked this down to differences in data that gets downloaded from Dial/Data. Has anyone seen this? What can I do about it, if anything? I do think that no matter how good a trading strategy gets, this type of error, can cause significant grief.

Regards,

Stewart

Re: data errors...

Date :4/12/2002 12:16:36 PM Poster : Randy Brown

If you're using end of day data and your computers are networked, you could simply download one set of data and convert it to Metastock format (if necessary or whatever format you choose so long as the Trader can read it) and then make it available to all three copies of the program. I do that with TC2000 data (the cleanest I've been able to find) and use the same data for everything. If the three copies of the Trader can't read simultaneously from the same file (??) then just copy the data folder to each computer after downloading. Something like that.

What I have become more concerned about is that I get a long for mu on one computer, and nothing on the other. Then I get a long on mu the next day on the other computer but not on the computer that I previously got the long on mu. The first was profitable, and the latter was not, it is as though the second were out of phase because of a data error. If you pick the right file to copy over, you luck out. If you copy the wrong one over, you lose.

Why would it be that I get different data from the exact same data source for the exact same day and the exact same symbol? Are they constantly adjusting their numbers?

Thanks,

Stewart

Trading System Performance Viewer

Date :4/12/2002 1:03:58 PM Poster : Steve in California

In a recent issue of TAS&C magazine, Mike Barna and John Ehlers published an idea for a spreadsheet that randomly calculates equity curves for a trading system based on the system's ProfitFactor and PercentProfitableTrades.

I took that idea and fleshed it out in an easy to use Excel spreadsheet that can be downloaded using the following link:

TradingSystemPerformanceViewer.xls

I think it's worth taking a look at if you haven't seen something like it before.

I've intentionally set the Profit Factor and Percent Profitable Trades inputs low to stimulate the process of seeing what it takes to get the equity curve to be what you want it to be.

Enjoy!

Re: Trading System Performance Viewer

Date :4/15/2002 3:11:56 PM Poster : Vince

Hello Steve

what is the practical use of this spreadsheet?

Thanks

Vince

Re: Trading System Performance Viewer

Date :4/16/2002 6:47:38 PM Poster : Steve in California

I'm no expert on trading system testing and simulation. I understand that there are various techniques for simulating possible system performance that I haven't looked into but just have in my mental queue of things to look into (e.g., Monte Carlo?).

The thing I like about Barna and Ehler's idea for simulating system performance within Excel is that simulation implementation was simple. The Barna and Ehlers idea in the magazine article proposed using non-monetary "units of profit" to plot the equity curve. My contribution was to require an entry of "Average Trade Loss" as well so that I could monetize the equity curve units for myself.

In advising users of a trading system in his Futures Truth interview, Mike Barna said "...understand that the drawdown and maximum consecutive losing trades numbers are your numbers. You either designed, bought or leased these numbers. Understand that these are your numbers and they may sooner or later be reflected in your account."

I didn't really understand the significance of this point until after I had implemented this version of the Trading System Performance Viewer and spent alot of time playing with it and pressing F9. But now I know the minimum ProfitFactor I must have for each PercentProfitableTrades input to feel comfortable. And I also know the minimum PercentProfitableTrades I must have for each ProfitFactor to feel comfortable. Knowing what MY minimum numbers are for these two inputs makes it absolutely clear what my minimum objectives must be in designing and building a trading system. Now I know what the minimum (software trading system) benchmarks must be for me to feel and be successful.

Guppy Indicator

Date :4/17/2002 11:01:05 PM Poster : Steve Kratochvil

If anyone has read Guppy's Book "Market Trading Tactics" then here is a little of what I have been playing with. I added the Guppy Moving Average Indicator to the Trading Strategy and offset it by –1.5. I later used Fuzzy on the convergence indicators I created from the Guppy. I have some very encouraging results that I am working on. They also caused the file to bloat to 7meg and caused a 1.09gig memory charge during operation. I will need to figure out how to get them to work smaller. I took them out so that if you do not have the Fuzzy Indicators or the computer power the chart will not give you any problems. I sent up a file Guppy.zip. I did base the Guppy off of the TEMA9 as it is smooth and seems to have zero to very little lag. This helps clean up the input so that the indicators report more meaningful information and less false signals. I included the TEMA9.tpl that you can drop in your Template directory for NSDT. You will need this to run this chart. The chart scale is 1 mins.

The file can be downloaded using the following link:

guppy.zip

DLL programming and VB.Net

Date :4/20/2002 10:02:54 AM Poster : Saul

Hi all,
I have been playing around with VB.Net recently, and have been quite impressed with it compared to prior releases of VB.

The question I have, has anyone in the group used VB.Net or C# to program dll's for Neuroshell. The IDE, Class creation, garbage handling and debugging features seem very good - and might prove an alternative to Power Basic or C++.

Any comments will be welcome.

Thanks in advance.

I didn't see any way to make standard dlls with VB. Where did you see the capability?

VB.NET is not a solution. PBDLL has real potential and will be a staple part of DLL solutions. As you may know VB.NET is more of a server script language and is a managed language. VB6 and VC++ are unmanaged languages and of those only VC++ exports functions. VC# is the only choice going into the future for an unmanaged language from Microsoft. Now PowerBasic might just be positioned to fill the DLL market space and grow up a bit. I see things like PowerBasic will be sought out by developers, now more often than they were in the past. If you need any help with DLL's just let me know.

Steve

Re: DLL programming and VB.Net

Date :4/29/2002 1:25:59 PM Poster : Saul

Hi thanks for you comments - and enlightenment - I found a program that can create an interface for VB/VB.Net Dll's called SpyWorks (http://www.desaware.com/) probably overkill and more than likely create a whole new set of problems, but I might have a look into it.

In so far as help with writing dll's with Power Basic that would be great - at the moment I don't have any specific questions I am going to go thru all the posts on here plus the example dll's. Any further suggestions would be appreciated.

Also is there anyway to get into a email discussion since the forum here seems to be exceptionally slow at updating the board with posts (takes a couple of days if post at a weekend).

Thanks
Saul

Detrending and preprocessing data series

Date :4/26/2002 7:06:39 PM Poster : Russ

As a newbie to neural nets, I have read a great deal about the importance of detrending and/or preprocessing data series before implementation in a net.
What do others think of this? How does one detrend and/or preprocess data
before placing into NST?

Thanks.

Russ

Re: Detrending and preprocessing data series

Date :4/30/2002 2:59:59 PM Poster : RiskArb

"normalization" in statistics, has a very specific meaning and refers to the transformation of data by subtracting each value from some reference value (typically a sample mean) and diving it by the standard deviation (typically a sample SD). This important transformation will bring all values (regardless of their distributions and original units of measurement) to compatible units from a distribution with a mean of 0 and a standard deviation of 1. This transformation has a wide variety of applications because it makes the distributions of values easy to compare across variables and/or subsets. If applied to the input data, standardization also makes the results of a variety of statistical techniques entirely independent of the ranges of values or the units of measurements

All of our neural nets except the Adaptive Net Indicators add-on automatically do the type of normalization RiskArb describes to the inputs. The neural nets in the add-ons Neural Indicators and Adaptive Turboprop 2 let you control the length of the period over which the normalization takes place (it's the lookback period). In addition to what we do automatically, you may want to do some detrending over time. We feel one of the easiest ways to do that is use inputs like percent change, spread percent, etc. That way a $10 change when the price is $60 looks to the net like a $1 change way back when the price was $6.

Re: Detrending and preprocessing data series

Date :5/1/2002 4:53:10 PM Poster : MattR

I have some questions about data preprocessing in NS that is mostly handled internally.
Can you shed any light on how data is adjusted?
Does it smooth data automatically (averaging)?
I assume it isn't automatically adjusted to a percentage change/log percentage change as there are both price and percentage change choices?
Are there any variance/standard deviation adjustments, automatically included? (more on this)
I assume no sampling/filtering is included? (more on this as well)

I have been wondering about adjusting output variables (ie usually whatever price change prediction) by some measure of volatility. When trading, one is constantly battling transaction/slippage costs. In this regard, volatility is a desirable, not necessarily a factor that one necessarily wants to remove from consideration. It seems like it would be valid to build nets to predict just prices moves (percentage or otherwise)....ie volatility adjusted moves times volatility.

I have also wondered about detrending data. First, I understand the skew that trending data can cause in neural networks. In using NS trader, the most likely sought after goal is to build wealth. Thus, using the predictions to predict tradable opportunities (and perhaps using profit objective functions), seems like a reasonable approach. However, trend factors can have more of an effect on trade profitability than other detrended factors. So, a set of inputs that result in an output implying a very profitable opportunity might largely be do to factors that have been removed - trend. I find myself somewhat confused/running in circles on using a monetary objective function while removing trend factors.

Is data sampled or filtered in any way? For example (familiar/old issue), a person utilizing a neural net for trading would often like to predict outlying (not necessarily extreme) events. With a large cluster of untradable/undesirable observations, an objective function using some sort of summation or lower order error function can result in the net being trained more on the "uninteresting" data. A related matter is that of one-time/extraneous/new events that are not desired in the net. Does anyone try excluding these? Is there a way to exclude certain data in NS? I suppose with large outlying data (news/one-time shocks) one could use conditional values to set it to zero or some other approximately median value.

Thanks for your time
Matt

There is no data sampling, smoothing, or filtering in the normalization unless you use the little check mark "Adjust training set for trending markets by evenly distributing training bars". That sometimes works well, sometimes not. It tries to create a training set with a more even distribution of up moves and down moves. It has been suggested before, and is on our list, to give the user the ability to filter in or out training patterns like news events, perhaps based on some indictors. That assumes you can decide which bars were effected by the news. On the other hand, isn't it true that general news can affect the whole market? Yesterday the resignation of the Sun CEO probably affected the whole tech segment, not just Sun.

Re: Detrending and preprocessing data series

Date :5/2/2002 10:27:40 AM Poster : Steve Ward

To what the Webmaster said, I might add that by their very nature, neural nets smooth data as long as you don't give them too many hidden neurons. To understand this, think about what happens when you use zero hidden neurons. You get a linear model - meaning you are fitting a straight line or plane through the data. Sure, outliers affect the angle of the line or plane, but linear models are pretty smoothed, aren't they? The more hiddens that are allowed, the more each little bump gets fit. But detrending by using percent change, etc, on both inputs and outputs I think is important. Many of the standard indicators detrend and even normalize by virtue of what they do. It is possible, I think, to worry excessively about smoothing. Of course, differing opinions are more than welcome here, and we'd like to hear them.

The Adaptive Net Indicators do work quite differently than most nets. Some feel they aren't nets at all. Unlike other nets, they don't need data in small ranges (which is the main reason nets need normalization) because they do pattern recognition by comparing. The help file suggests using the Z-score indicator if you feel you have variables that are not in the same range, although to a limited extent the "contribution" factors do smoothing and range reduction. At some future time we may make normalization an option for ANI.

Possible directions to explore with NST

Date :4/30/2002 9:20:23 AM Poster : Dan Kinter

I am a newbie to NST. I have done all of background studying and now am ready to begin my quest. I am very aware of the following:
(a) there are MANY, MANY ways to go about this quest with NST (I own all the add-ons except DataX which is too complex for me)
(b) you guys/gals have worked extremely hard to develop your own systems which, of course, must be protected

However, perhaps you could give me some suggestions as to what general routes of exploration you have found fruitful (I'm only speaking in the most general of ideas to explore).

For example, one path might be:

(1) pick out moments in time in your particular product's chart that you KNOW are critical to the product's immediate directional movement and then experiment with NST to find indicators which express that particular market's dynamics at that time and then use the Fuzzy add-on to "photograph" that moment in time and then build a system which "recognizes" those dynamics the next time they occur. Such an approach might be described as basically marking "moments", using the optimization features to find significant indicators, and then using Fuzzy to "photograph" that moment and then recognize it when it occurs again.

Another path might be,

(2) focus on the Prediction Wizard to build a system by incorporating various predictions into indicators which are then used in the Trading Strategy Wizard to develop a system.

I am just looking some general directions which some of you have found fruitful without giving away and "work product secrets". I am certain that many of you have used NST in very, very different ways and perhaps you might give a "newbie" a hint as to what are some good directions to take.

Thanks in advance for any help. Dan

Re: Possible directions to explore with NST

Well, Dan the first question you need to answer is. Are you going to Day Trade? This is based on how much time and money you have to throw at the problem. If you are going to Invest or Swing Trade then you can use your evenings and start with 5K. Day Trading requires full time and 30K to start. The next thing you need to do is fully understand your indicators. Study the Fuzzy Logic indicators and what they can do and cannot do. They can interpret your other indicators little nuances where otherwise you only have crossover points and penetration lines or levels to signal you.

Steve

Steve - I apologize for not being clearer.
My goal is to develop a day trading system which uses very short time frames (1-3 minutes) but which attempts to find repeating "creme de la creme" patterns within the ES, NQ and/or QQQ products which, in the futures world, produce small profits but which, in the financial world, add up to enormous profits (like 10.0% net, net return per month - this translates into an average of approximately 1-2 net, net points per day in these futures markets). I have the time and patience to seriously attack this puzzle. Again, I appreciate your help.

Dan,

IMO, you don't really need to find any 'creme de la creme" patterns in order to do what you are talking about. You can net nearly 5% per day on 1 ES point trading with a broker who allows you 25% margin during the day. Using a short period chart (preferably tick based) and something simple like stochastics, you can usually have that point in the first 15 minutes after the market opens and be done for the day.

I have a similar view of trading - I want to be in the market for as little time as possible, and I exit based on my preset point profit instead of using an indicator to exit. May seem silly, but popping off 10 one point trades per day is a whole lot easier than make 2- 5 point trades. You don't have to be in the trade for longer than a couple of minutes usually, and it is far less stressful. Sure, you will pay more commissions - but the reduction in risk is well worth it.

I am a newbie to NST. I have done all of background studying and now am ready to begin my quest. I am very aware of the following:
(a) there are MANY, MANY ways to go about this quest with NST (I own all the add-ons except DataX which is too complex for me)
(b) you guys/gals have worked extremely hard to develop your own systems which, of course, must be protected

However, perhaps you could give me some suggestions as to what general routes of exploration you have found fruitful (I'm only speaking in the most general of ideas to explore).

For example, one path might be:

(1) pick out moments in time in your particular product's chart that you KNOW are critical to the product's immediate directional movement and then experiment with NST to find indicators which express that particular market's dynamics at that time and then use the Fuzzy add-on to "photograph" that moment in time and then build a system which "recognizes" those dynamics the next time they occur. Such an approach might be described as basically marking "moments", using the optimization features to find significant indicators, and then using Fuzzy to "photograph" that moment and then recognize it when it occurs again.

Another path might be,

(2) focus on the Prediction Wizard to build a system by incorporating various predictions into indicators which are then used in the Trading Strategy Wizard to develop a system.

I am just looking some general directions which some of you have found fruitful without giving away and "work product secrets". I am certain that many of you have used NST in very, very different ways and perhaps you might give a "newbie" a hint as to what are some good directions to take.

Thanks in advance for any help. Dan

Let me add one more thing to my comments -

Don't let yourself get stuck into thinking that minute based charts are the best way to go. Unfortunately, you NSTrader can't deal with these, but I've found that constant tick based charts are FAR better in every area. You would be suprised what a difference they make - indicators are almost naturally smoother, and for emini futures contracts, you almost dont even need any indicators if you choose a bar size of a certain number of ticks.

On 5/1/2002 4:04:23 PM Jimmy Raineri wrote:
Dan,

IMO, you don't really need to find any 'creme de la creme" patterns in order to do what you are talking about. You can net nearly 5% per day on 1 ES point trading with a broker who allows you 25% margin during the day. Using a short period chart (preferably tick based) and something simple like stochastics, you can usually have that point in the first 15 minutes after the market opens and be done for the day.

I have a similar view of trading - I want to be in the market for as little time as possible, and I exit based on my preset point profit instead of using an indicator to exit. May seem silly, but popping off 10 one point trades per day is a whole lot easier than make 2- 5 point trades. You don't have to be in the trade for longer than a couple of minutes usually, and it is far less stressful. Sure, you will pay more commissions - but the reduction in risk is well worth it.

Please permit me to express an opposite opinion. I think that applying standard indicators built for even time-sized bars is somewhat misleading at best. They may look smooth, but they may not relay the correct information. Many of these indicators are based upon concepts like averages over n periods. If you suddenly have a great volume of ticks in a very short period of time, the periods get squeezed in time. Your indicator essentially becomes an exponential indicator, and exponential ones become even more skewed. Worse, you never know whether things are skewed at the beginning, middle, or end. You'd be reduced to consulting the volume for an interpretation of your indicators.

Hi Maxwell,

I'm not sure I fully understand what you are saying. IMO, whatever indicator you choose to apply to whatever type of bar always relays the correct information. You may interpret this information differently, but it is nontheless correct. I have yet to read anything that explains why time based bars are better than anything else.

An indicator that uses X over N periods should work just as well with minute based periods or tick based periods. As long as each period is a the same fixed length of "something" it shouldn't matter at all what that something is.

I don't understand your point about having a greater number of ticks in a short period of time - because IMO this is one area where tick charts provide a huge benefit. Take, for example, an indicator that uses the bar close as it's input, like most indicators do. If you are using a 3 minute chart, for example, there might be heavy buying on the ES contract that causes ES to run up 6 points over a three minute period. Since your indicator is only calculated every 3 minutes, when the bar closes, you may get a signal from your indicator (say a stochastic xover) as it gets recalculated - however, you just missed the major part of the move. And the same really applies for 2 or 1 minute charts - you will miss any quick and big point move waiting for your minute or two minutes to be up.

On a tick based chart, you will more than likely have, for example, six or seven bars generated over that same three minute period - and your signal will surely come far earlier than any time based period could provide.

There is no magic in time based bars. A bar could close at 1000.25 causing a indicator to signal, or if that 1000.25 trade came through 1 second later it might close at 1000.00, giving you no signal, and causing the next bar to open at 1000.25. Time based bars are almost useless after hour because your indicators are effectively flattened because of little price movement within the period chosen. Tick based bars look and feel exactly the same during after hours as they do during normal hours.

IMO, indicators are just that - something to indicate something. To me, it doesn't matter what they were designed to do, or how they are "supposed" to be used - everyone uses and interprets indicators the way the books say you are supposed to. Discovering non-standard ways to use the tools available will give someone a substantial edge.

Be aware that EVERY trader on the floor of the merc and EVERY trader off the floor in the Merc building is using the 1 minute chart. They are ALL looking at the same levels. Using different time periods or a tick based chart as Jimmy describes is a good idea.

im not sure i understand the logic of wanting a different time period than the brokers are seeing. can you please elaborate on why looking at a different representation gives an advantage? my first thought was, sure i need to see a different bar than they do. then after thinking about it i wondered why - if i want to outsmart them shouldnt i see what they are basing their game plan on?

You can net nearly 5% per day on 1 ES point trading with a broker who allows you 25% margin during the day. Using a short period chart (preferably tick based) and something simple like stochastics, you can usually have that point in the first 15 minutes after the market opens and be done for the day.

I have a similar view of trading - I want to be in the market for as little time as possible, and I exit based on my preset point profit instead of using an indicator to exit. May seem silly, but popping off 10 one point trades per day is a whole lot easier than make 2- 5 point trades. You don't have to be in the trade for longer than a couple of minutes usually, and it is far less stressful. Sure, you will pay more commissions - but the reduction in risk is well worth it.

I am a newbie to NST. I have done all of background studying and now am ready to begin my quest. I am very aware of the following:
(a) there are MANY, MANY ways to go about this quest with NST (I own all the add-ons except DataX which is too complex for me)
(b) you guys/gals have worked extremely hard to develop your own systems which, of course, must be protected

However, perhaps you could give me some suggestions as to what general routes of exploration you have found fruitful (I'm only speaking in the most general of ideas to explore).

For example, one path might be:

(1) pick out moments in time in your particular product's chart that you KNOW are critical to the product's immediate directional movement and then experiment with NST to find indicators which express that particular market's dynamics at that time and then use the Fuzzy add-on to "photograph" that moment in time and then build a system which "recognizes" those dynamics the next time they occur. Such an approach might be described as basically marking "moments", using the optimization features to find significant indicators, and then using Fuzzy to "photograph" that moment and then recognize it when it occurs again.

Another path might be,

(2) focus on the Prediction Wizard to build a system by incorporating various predictions into indicators which are then used in the Trading Strategy Wizard to develop a system.

I am just looking some general directions which some of you have found fruitful without giving away and "work product secrets". I am certain that many of you have used NST in very, very different ways and perhaps you might give a "newbie" a hint as to what are some good directions to take.

Thanks in advance for any help. Dan

My comment was meant only as a notice that the floor traders are focused on the 1 minute bar and using other tactics might help. Agreed, if you want to outsmart them you should be aware of what they are looking at. Watch it enough and you see their patterns.

jeff

On 5/2/2002 9:16:34 PM Jimmy Raineri wrote:
Hi Maxwell,

I'm not sure I fully understand what you are saying, IMO, whatever indicator you choose to apply to whatever type of bar always relays the correct information. You may interpret this information differently, but it is nontheless correct. I have yet to read anything that explains why time based bars are better than anything else.

An indicator that uses X over N periods should work just as well with minute based periods or tick based periods. As long as each period is a the same fixed length of "something" it shouldn't matter at all what that something is.

I don't understand your point about having a greater number of ticks in a short period of time - because IMO this is one area where tick charts provide a huge benefit. Take, for example, an indicator that uses the bar close as it's input, like most indicators do. If you are using a 3 minute chart, for example, there might be heavy buying on the ES contract that causes ES to run up 6 points over a three minute period. Since your indicator is only calculated every 3 minutes, when the bar closes, you may get a signal from your indicator (say a stochastic xover) as it gets recalculated - however, you just missed the major part of the move. And the same really applies for 2 or 1 minute charts - you will miss any quick and big point move waiting for your minute or two minutes to be up.

On a tick based chart, you will more than likely have, for example, six or seven bars generated over that same three minute period - and your signal will surely come far earlier than any time based period could provide.

There is no magic in time based bars. A bar could close at 1000.25 causing a indicator to signal, or if that 1000.25 trade came through 1 second later it might close at 1000.00, giving you no signal, and causing the next bar to open at 1000.25. Time based bars are almost useless after hour because your indicators are effectively flattened because of little price movement within the period chosen. Tick based bars look and feel exactly the same during after hours as they do during normal hours.

IMO, indicators are just that - something to indicate something. To me, it doesn't matter what they were designed to do, or how they are "supposed" to be used - everyone uses and interprets indicators the way the books say you are supposed to. Discovering non-standard ways to use the tools available will give someone a substantial edge.

On 5/2/2002 4:01:13 PM Maxwell Craven wrote:
Please permit me to express an opposite opinion. I think that applying standard indicators built for even time-sized bars is somewhat misleading at best. They may look smooth, but they may not relay the correct information. Many of these indicators are based upon concepts like averages over n periods. If you suddenly have a great volume of ticks in a very short period of time, the periods get squeezed in time. Your indicator essentially becomes an exponential indicator, and exponential ones become even more skewed. Worse, you never know whether things are skewed at the beginning, middle, or end. You'd be reduced to consulting the volume for an interpretation of your indicators.

On 5/2/2002 1:02:34 PM Jimmy Raineri wrote:
Let me add one more thing to my comments -

Don't let yourself get stuck into thinking that minute based charts are the best way to go. Unfortunately, you NSTrader can't deal with these, but I've found that constant tick based charts are FAR better in every area. You would be suprised what a difference they make - indicators are almost naturally smoother, and for emini futures contracts, you almost dont even need any indicators if you choose a bar size of a certain number of ticks.

On 5/1/2002 4:04:23 PM Jimmy Raineri wrote:

Excellent choice. I am a 1 min man as well. The first thing that you NEED, now that you have all the indicators, is the TEMA9. I have sent up the tpl for it a few times. I will send it again. This allows you to smooth out a data series without noticing the lag. I replace almost all of my Close time series inputs with the TEMA9 and avoid all of the jitters in the close. I have based all of my successful work on the TEMA9. I know this will help.

I have found several consistent generalized patterns in stocks. With pattern research you can hit the 100% success zone. I am in the middle of fine-tuning some daily patterns that I will use to guide my other indicators.

NSDT Advice

Date :5/5/2002 4:59:20 PM Poster : Steve Kratochvil

If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying; "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

Re: NSDT Advice

Date :5/7/2002 1:32:14 PM Poster : Stewart

Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

Re: NSDT Advice

Date :5/7/2002 11:14:13 PM Poster : Steve Kratochvil

Well, Stewart. Here it is. I have tried to answer each of your paragraphs in order.

Your first issue, I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.

I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. But at failure I would evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

On 5/5/2002 4:59:20 PM Steve Kratochvil wrote:

If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying; "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

Hi Steve K.

Does your Auto Pilot work with any Order Entry program or only with a specific one?

Thanks

Vince

On 5/7/2002 11:14:13 PM Steve Kratochvil wrote:
Well, Stewart. Here it is. I have tried to answer each of your paragraphs in order.

Your first issue, I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.

I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. But at failure I would evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

Yes that is what I meant.
I use a platform called Redi. (www.redi.com) What I will like to do is have NSDT send Buy/Sell orders directly to Redi when they occur.

Thanks

The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

On 5/5/2002 4:59:20 PM Steve Kratochvil wrote:
If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying; "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

Re: NSDT Advice

Date :5/13/2002 2:54:02 PM Poster : Steve Kratochvil

Well, REDI has it's proprietary "UI" and they seem to be very proud of it. If they have an online order entry screen back in the customer area then it is a very easy task to send the HTML order. If all orders only come through their UI then it is a very difficult task and the exact method that they use to send the orders is unknown.

I have employed several technologies in one package to be flexible to adapt to the constant changes that brokers make and also in the event I change brokers or add a broker. I used VB6 as my platform and integrated JavaScript into it. The JavaScript does all of my HTML work inside the VB6 app. I even have a dash of VBScript thrown in for regular expression work on HTML fragments from the JavaScript. The DataX is of course the way that I am sending out the signal. To the AutoPilot.

Steve

Hi Steve K.

Does your Auto Pilot work with any Order Entry program or only with a specific one?

Thanks

Vince

On 5/7/2002 11:14:13 PM Steve Kratochvil wrote:
Well, Stewart. Here it is. I have tried to answer each of your paragraphs in order.

Your first issue, I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.

I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. But at failure I would evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying; "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

Thanks for your prompt reply Steve.
And yes Redi also has an on-line order entry screen.
Any suggestion on how to do it?

Thanks

Vince

On 5/13/2002 2:54:02 PM Steve Kratochvil wrote:
Well, REDI has it's proprietary "UI" and they seem to be very proud of it. If they have an online order entry screen back in the customer area then it is a very easy task to send the HTML order. If all orders only come through their UI then it is a very difficult task and the exact method that they use to send the orders is unknown.

I have employed several technologies in one package to be flexible to adapt to the constant changes that brokers make and also in the event I change brokers or add a broker. I used VB6 as my platform and integrated JavaScript into it. The JavaScript does all of my HTML work inside the VB6 app. I even have a dash of VBScript thrown in for regular expression work on HTML fragments from the JavaScript. The DataX is of course the way that I am sending out the signal. To the AutoPilot.

Steve

On 5/13/2002 9:37:07 AM Vince wrote:
Yes that is what I meant.
I use a platform called Redi. (www.redi.com) What I will like to do is have NSDT send Buy/Sell orders directly to Redi when they occur.

Thanks

Hi Steve K.

Does your Auto Pilot work with any Order Entry program or only with a specific one?

Thanks

Vince

On 5/7/2002 11:14:13 PM Steve Kratochvil wrote:
Well, Stewart. Here it is. I have tried to answer each of your paragraphs in order.

Your first issue. I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.

I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. But at failure I would evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

On 5/7/2002 1:32:14 PM Stewart wrote:
Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

On 5/5/2002 4:59:20 PM Steve Kratochvil wrote:
If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The AutoPilot is not commercial grade in it's present form. What do you think it is worth in dollars to automatically launch orders? I have entertained the idea of trading the AutoPilot for 1min charts that have 80% success rate and are profitable. I hold to all the Ten Commandments except number 9. Also I don't actually break it, I am just bending it. Hahahaha.

1. Thou shalt seek inputs that affect the output.
2. Thou shalt not use too many inputs.
3. Thou shalt not use too few training patterns.
4. Thou shalt choose thy training patterns so that they are not clustered and are a balanced representation of the problem.
5. Thou shalt not judge thy model by its ability to reproduce training patterns.
6. Thou shalt not apply statistical measures and precision to financial modeling.
7. Thou shalt not use too many categories when classifying.
8. Thou shalt not code inputs with monotonic values unless they represent monotonic concepts.
9. Thou shalt not waste time coveting thy neighbor's financial models.
10. Beware of extrapolation of non-linear models.

I don't waste time on it, but I do covet my neighbor's financial models. I think I am going to give in to this one vice and plead human. If there is enough interest in the AutoPIot I might get some of my guys to clean it up a bit. As for support from Tradestation that was funny. If I were to actually undertake the AutoPilot as a product I promise that I will be supporting it as long as I am trading with it. I need it to work as well as anyone else.

Some things to consider about the SEC. If you are trading your own account and developing an automated trading system, you are fine. If you derive revenue from your ATS from other users, or assist other users in executing trades, you must be registered as a broker-dealer. There are exceptions to this, and you can submit a No-Action Relief Letter to the SEC to petition for an exemption from registration of the broker-dealer requirement.
NO ATS for options. It is a violation of U.S. option exchange rules to transmit orders that have been created and communicated electronically without any "manual intervention". Thus, it would be a violation of exchange rules for a customer to use an autoquote or similar program that created orders and sent them to an exchange without any action by the customer.

So when I ask, "What do you think it is worth in dollars to automatically launch orders?" one needs to consider the weight of the proposition. I would be willing to file for exemption and talk to Steve Ward again, if the price was right or the charts were good.

I hope this helps,

Steve

If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
