If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying; "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

I am not sure if you have checked or not, but REDI provides multiple and extensive options for direct access. SLK provides access through ActiveX and through FIX. REDI is more of an institutional platform, thus it comes as no surprise that the capabilities are much greater.....see:

S.K.
Thanks for the prompt responce. Unfortunately I am not a 1 minute trader-I do not have the time currently to "do" short time frames. Hence the desire for your code ! I am a position trader (30 min. bars/average time in trade 2.5 days) and in particular, at this point a Tradestation user. From a performance perspective I have Tradestataion "systems" with a historical sharpe ratio of near 3 (that includes slippage & commish). I too live in the real world. I currently utilize TS2000i's email alert functionality to get me in/out of trades as necessary.
I am looking to migrate to NST as it is a better tool for back testing/ optimizing (avoiding curve fitting) and of course the nets. However, TS has far supperior graphics capabilities. Paint bar studies in particular are great (if this and that then turn a bar green-if you are unfamiliar with TS). Your "how to" detailed in this thread (which I thought was right on by the way) outlines the NEED to feed the net useful stuff and that is usually found by looking at your indicator relative to the price movement and disecting to determine if the two correlate. Often my idea for an indicator is "close" however, I will miss some opportunities and just be wrong on others. I will then add a bunch of logical AND or OR to my logic to seperate the wheat from the chaff. Again, this is very efficient in TS and while possible in NST it seems less intuitive. That subtlety seems minor, but I am a big fan of garbage in- garbage out and I sort alot of garbage.

With that long winded intro- I think the two programs can work synergistically very well. I could barter some of that stuff for the order execution stuff if you have any interest. Trying to answer the question of value of an order execution system..... I presume it is largely a function of how many copies you can sell and how much coding it would take to make it idiot proof. I have no idea how many copies of NST are out there, but if the price was not too painful you could move alot of copies(500*200=200*500=100,000- the question is which one is the number of copies and which one is the price ?). I suppose you may have prompted Ward and co. to add another add-on.

Thanks again and good luck.

JK

On 5/14/2002 11:36:35 AM Steve Kratochvil wrote:
The AutoPilot is not commercial grade in it's present form. What do you think it is worth in dollars to automatically launch orders? I have entertained the idea of trading the AutoPilot for 1min charts that have 80% success rate and are profitable. I hold to all the Ten Commandments except number 9. Also I don't actually break it, I am just bending it. Hahahaha.

1. Thou shalt seek inputs that affect the output.
2. Thou shalt not use too many inputs.
3. Thou shalt not use too few training patterns.
4. Thou shalt choose thy training patterns so that they are not clustered and are a balanced representation of the problem.
5. Thou shalt not judge thy model by its ability to reproduce training patterns.
6. Thou shalt not apply statistical measures and precision to financial modeling.
7. Thou shalt not use too many categories when classifying.
8. Thou shalt not code inputs with monotonic values unless they represent monotonic concepts.
9. Thou shalt not waste time coveting thy neighbor's financial models.
10. Beware of extrapolation of non-linear models.

I don't waste time on it, but I do covet my neighbor's financial models. I think I am going to give in to this one vice and plead human. If there is enough interest in the AutoPIot I might get some of my guys to clean it up a bit. As for support from Tradestation that was funny. If I were to actually undertake the AutoPilot as a product I promise that I will be supporting it as long as I am trading with it. I need it to work as well as anyone else.

Some things to consider about the SEC. If you are trading your own account and developing an automated trading system, you are fine. If you derive revenue from your ATS from other users, or assist other users in executing trades, you must be registered as a broker-dealer. There are exceptions to this, and you can submit a No-Action Relief Letter to the SEC to petition for an exemption from registration of the broker-dealer requirement.
NO ATS for options. It is a violation of U.S. option exchange rules to transmit orders that have been created and communicated electronically without any "manual intervention". Thus, it would be a violation of exchange rules for a customer to use an autoquote or similar program that created orders and sent them to an exchange without any action by the customer.

So when I ask, "What do you think it is worth in dollars to automatically launch orders?" one needs to consider the weight of the proposition. I would be willing to file for exemption and talk to Steve Ward again, if the price was right or the charts were good.

I hope this helps,

Steve

On 5/7/2002 11:14:13 PM Steve Kratochvil wrote:
Well, Stewart. Here it is. I have tried to answer each of your paragraphs in order.

Your first issue, I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.

I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. Not all failed I sorted evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.

As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.

I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back teeting to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

On 5/7/2002 1:32:14 PM Stewart wrote:
Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

On 5/5/2002 4:59:20 PM Steve Kratochvil wrote:
If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. Re: NSDT Advice

Date :5/11/2002 10:05:43 AM Poster : Stewart

Steve,

Thanks again for the info. I'm trying to re-design my existing systems with your advice in mind.

By the way, I try and stick to core elements of price and volume. I feel like these are the truest indicators and the more complex an indicator is, the farther you are getting from them.

Are the systems you build day systems or swing? I've had much better success with swing systems so far.

Regards,

Stewart

>
> I apologize for not being clear. I just type this out and post without concerted editing or revision. In my attempt to state concept and theory I used the words core elements. I do not mean that one should remain on the raw data. I reference TEMA as an example. I use it to replace the Close in most inputs. It is a highly effective and complex indicator he holds to the core element of Price. Then when you build off of this you are still inline with Price and things that you apply to study TEMA are going need to follow the same mentality. I am going to evaluate JMA from Jurik soon. They claim that it is better than TEMA. I don't know. TEMA is very solid and may be better for what I am doing. Now indictors that I shun are things give abstract computational points of view that require farther interpretation, and in and of them selves present another data series path that needs indicators to give it meaning. Look for the logic of the indictor's theory to stay close to the Price or Volume. A lot of Oscillators quickly end up on the "do not use" list. This category of indicators has a higher probability of getting away from the stock's price or volume and just blathering about some point of view it might have. So I evaluate them with a large grain of salt. Above all it must say something clearly meaningful and do not write off anything without due diligence. But once you have investigated it and have decided that a particular indicator is not art of the plan. Do not come back to it just because someone is pushing it. Draw your lines in the sand and reach your goal of a profitable system with logical process of elimination.
>
> Also fully understand what any indicator does. If you need behavior like what an SMA can give then AMA is a bad choice. This I especially true if you do not want to hold so close to the data series and need broad stroke ability. Use the indicators for what they are intended and do not polarize on one type. Polarizing has the effect of reducing your indicator vocabulary to one word. Conversely do not pile indicators without deliberate intent and design. Otherwise it is like a crowed room of people all talking at once. You will not make heads or tails out of it.
>
> I am only Day Trading at this time. When my account value exceeds my ability to gainfully employ all of it, I will Swing Trade the portions that I cannot Day Trade with. I have estimated that target value of my account at $300K to $400K. Some where in there is what I see as the max amount that I will be able to Day Trade successfully.

> Your first issue, I am assuming stems from the way the resulting trades are executed. This is how it happens. The very bar that the signal happens on gets a blue or red Marker. The trade execution happens following the signal at the close of the next bar. You could not have executed during the bar that created the signal because the signal does not exist until the bar is given a close. And for probability sake the close of the next bar would be a satisfactory value to represent your more than likely actual entry price, which is different than the signal price.
>
> I optimize decisively. I know what the optimization should produce before it does. I am not trying to let it guess around for the best fit in a vacuum of infinite possibilities. I would not optimize more than once for the first fit and then only if the Trading Strategy started to fail. But at failure I would evaluate the trades that failed before I started optimizing like crazy. I have also not found a lot of value in re-optimizing. Once I get it set it comes out the same even after several optimization. The optimizer is phenomenal and I have not found a need to use it every day. If you do I would be very suspect of the inputs that you are using. They are more than likely too vague and broad in there scope. Clear up the vision of your system. Simplify down to the core pieces of the most complex system you can create. Give the optimization things that it can work with that are based on solid logic. If the optimizer gets over in left field somewhere, that is because it can and you have not roped it in to the problem at hand. You need to focus your optimizer. Try starting out with Boolean inputs and get the hang of it until you can expand the BOUNDS of the indicators used in your system.
>
> As for your over-optimization. Stop. The optimizer is not going to just cough up a golden egg one day. I have tried that many times. I have run the optimizer into the ground. Think about what it is trying to do. If you look at your results from time to time you might be illuminated to see that optimizer try's values that are outside the bounds of the indicators given that these values would not work it would be safe to assume that they will not be the best choice. Now if they do end up as part of the solution then you have not presented the optimizer with an accurate picture and things are a bit blurry for it and it guess the best it can. As for re-optimizations not giving you the same results. I have experienced a lot of that too. Now it hits the same results every time no matter how many times I optimize. The best way for you to improve is decide on exploring the one way to trade stocks and build indicators that represent that and truly support your theory. Then run optimizations on the different indicators to see if there might be some improvement within the settings of the indicator. If not you have them set correctly and need to move on to adding them to nets. Then optimize the nets with your locked down indicators. They are locked down because you know that much is correct and must not change.
>
> I back testing and implementing are two separate steps. I back test like crazy. I have even sent two charts the crashed during back testing to ward systems for their review. I back test everything. When an indicator has an 80% success rate or better in the back test I then move on it. I take these indicators and try to work with them in nets, which are also back tested. If I am satisfied with the results then I trade it. This weekend I decided to change stocks. One thing that you must really drive into your head is, that your indicators need to transcend stocks, sectors and markets. There are so many personalities in

stocks out there, that if you try and niche up on one, you will not do well when that sector falls out of favor with the market. You must focus on the basic elements of a stock, which they all have in common. The have only have three choices, go up, go down or remain the same. All stocks only do these three things and they only produce two types of information, price and volume. So once I am locked in I trade, and by the way I chose a different stock and just changed out the symbol on the chart and traded away today. I made a bit over $1000 by 10:30 so I walked away. I must confess that is not a lot but, I will be checking to make sure that I have a good fit in the morning and keep on driving.

The actual implementation is accomplished with an application that I wrote called Autopilot and the DataX Add-on. The DataX passes the signals to the AutoPilot, which executes the orders. That is it.

Long and short of it: NSDT is hard hard work and worth it.

I hope this helps,

Steve

On 5/7/2002 1:32:14 PM Stewart wrote:
Hi Steve,

First of all, thanks for the pointers. I have some specific questions, so here it goes.....

I know there have been several threads around preventing the optimization of specific indicator parameters such as hiding them by creating a custom formula. One of the things I've noticed about optimization is that one of the causes of over-optimization seems to be a result of entry and exits ending up with different values. Has anyone found a way to keep the parameters in sync?

Optimization - Suppose you have a day strategy with a prediction and some indicators. How often do you optimize the prediction? How often do you optimize the strategy itself?

Over-optimization - Help! I've found it is easy to come up with strategies that provide good returns, but most of the time, they end up being over-optimized. I've tried increasing the number of bars, lowering the number of hidden neurons, and not letting NSDT finish optimizing (which I don't like because you can't always replicate the results if you happen to be sucessful. - Any ideas of how to improve?

Implementation of Daytrading Strategy - Once you have a strategy that you feel will be successful based on your testing, how do you implement it? You sit at the computer waiting for the signals? Do you use the continuation of a sucessful backtest as the starting point or do you start over?

I'd really appreciate any advice you or others could give.

Thanks,

Stewart

On 5/5/2002 4:59:20 PM Steve Kratochvil wrote:
If you are looking for some advice about NSDT, here is my attempt to be profound.

First, there are limits to NSDT and your computer. You will be working toward squeezing the most out of everything. The amount of RAM and CPU you have will directly affect how many indicators and what type of indicators you will use. Different indicators incur different calculation weights during the day. These weights are different during the day than after hours. So get a feel for the heavy ones and determine their value for your system. If they cannot finish their calculation in time for the next bar they are not even tradable. You need to see waiting for price ticks flash in the status bar on every bar to know that you are good to go.

Second, you will need to get a feel for how big your file can grow before it becomes unmanageable. After you have some quality work, save a copy of the work file some where and return to your work, then delete out all the build indicators that you used getting to the results and then continue from there. I have to keep my files under 1MB for optimum performance. The reasonable limit size of your file is directly controlled by how much RAM you have and the indicators you are using. The weight of the indicators really stands out when you add more time series data or run Trading System back test.

Third, Optimizations need to be scheduled on a test plan and run at night while your sleep. In addition your nets are only as good as your indicators. If you can't see it, neither can the net. If an indicator does not exist, the net will not make it up for you with some stroke of genius. So your optimization needs to be based on solid indicators that have at least an 80% success rate even if it is not profitable. Optimizations for indicators need to be trying to achieve the Winners – Losers. The net can take theses good solid indicators and draw correlations similar to how you would (had you been watching) and try to achieve the goal of Net Profit. A good system (80% success rate) can be made profitable and has the ability to translate to other stocks and time frames. A strictly profitable system does not. It will be confined to the specific market conditions and fail over time. This is where most "Black Box" systems come from.
Once you have your indicators that seem to survive trial and error, lock them down by saving them as tpl's with all of the settings hidden in the advanced area. Do this before you feed them into your nets for optimization. You want to do this because you want the net to optimize on the good indicators that are based on sound logic. The net can then leverage this good info to make better decisions. The point being, your brain can out perform a neural net every day of the week, but your brain with a neural net assistant can smoke everyone else consistently. Note: You can only save indictors as tpl's if you purchased the NeuroShell Day Trader (NSDT). I cannot stress enough that you need all the best tools. If you don't have all the Add-on Nets your going to miss some of the most powerful indicators made to date.

Fourth, Price and Volume. Set up a collection of indicators that cover these individually as well as together. Try to avoid arbitrary penetration lines and other mathematical lines in the sand unless they are part of a BOUND indicator. Stick with generalized indicators that use percentages or shapes that can be formed correctly no matter where the price or volume go. Understand your indicators. Understand the logic and theory behind why they are built the way they are to be used. When you are building your own indicators write down why you built them. Log your progress. I am fortunate enough to be able to keep a lot of things in my head, but I cannot keep them all in the front at one time. I note my work for myself.
If you are a day trader then the Price is the leading indicator that you need to follow and Volume is the strength of the commitment to that price. The news, the psychology, the fundamentals, the market professionals, and you are all represented in these two things. You need only build indicators that focus on these things. If you do not have price movement and volume surges in your stock then it is not being traded and you will not make any money. Chose stocks that have a heart beat (Large Price Movement) and enough liquidity (High Average Volume) to get in and out when you desire. I use TC2000 to scan for a list of day tradable stocks that I review in NSDT. If you do not have TC2000 you need it. You can find great stocks fast, that NSDT can really use and make money with.

I close this post by saying: "These are the best general pieces of guidance that I can pass along to anyone that have made me money." When faced with a great tool like NSDT, that allows almost everything to be changed, (There are a few things I wish I could change that are not open to a data series.) you should not quaffel on which direction to go with anything you build. If you are stuck as to how to make an indicator work, then put in the extremes and see what it does. This should give you a great idea about what values in the middle of the extremes might do or how they may be interpreted. Also post your question on the forum, and be VERY SPECIFIC. If after that and the indicator does not communicate to you any meaningful information, chuck it out and move on.

I hope this helps and I can empathize with everyone who feels lost in NSDT. Just to let you know it does get better with practice and financially profitable with persistence.

Steve

Re: NSDT Advice
Date :5/12/2002 10:06:18 PM Poster : Jacobs

Thank you Steve Kratochvil for your many thought-provoking advice.

First, I use NST Pro (EOD data) and I can also save indicators as tpl's but.
I can't load an intraday chart for a view.

You proceed in a very methodical way with your Day Trader.

From what you write I get the impresson that you build your indicators that supports your theory then investigate them one by one and calculate it's success rate(=percent profitable trades)?

If I understand this you are optimizing a single(?) indicator to see if there are some improvements within it's settings.
How is this single (if so) indicator optimization carried out?
Is it in a Net (Insert/New Prediction…) or a Trading Strategy?
What objective function do you use – you have mentioned: Maximize #Winners-#Losers ?

If you decide the indicator is good you save it as a tpl.

When you have a collection of goood indicators you put them in a Net (Insert/New Prediction…) , start an optimization for indicators – is this the choice "input selection"? using the objective function: Maximize #Winners-#Losers?

Following this, and maybe the last step, you carefully optimize, with a focus, for Profit in a Net(Insert/New Predictions…)

This is how I understand your last posts.
What puzzles me most is, if so- how do you optimize a single indicator?
I hope these issues are not too detailed about your work.

Re: NSDT Advice
Date :5/13/2002 11:17:45 AM Poster : Steve Kratochvil

Actually it is very simple. Here is how I work. Given these constants:
1 We are all looking for the peaks and bottoms of price movement. That is the goal of all 100% of traders and trading systems. We can call it the Law of Reversal.
2 All issues travel in one direction at a time and only make two choices with no choice being a third. The price goes up and the price goes down or the price very rarely just remains the same. We can call this the Law of Direction.
3 All issues have an amount of interest at different levels. The volume can be strong and it can be light. Volume can surge, spike and drop off showing the amount of interest in the issue. We can call this the Law of Sentiment.

All indicators attempt to define the Law of Reversal. They rely on the Laws of Direction and Sentiment to do so. So here goes.

I build an indicator.
I look at it in comparison to the Law of Reversal.
If it looks good and semi reliable over time, I place it into a Trading Strategy and see what it can do all by its self. If it can develop over 80% success rate I am thrilled. More often than not, work is required to adjust it or use it. If the success rate is 40% or less I am concerned about the validity of the nonsense I may have just came up with and I will check to see if I am thinking straight. In working the indicators I limit the amount on time the Trading Strategy will hold that position to about 5 bars or a price target of .25. This way I can get a better picture of how it truly is doing with the Law of Reversal. After applying all the common sense logic setting or theory settings form a book, friend or elsewhere. I also run the optimizer on it looking for Max Winners – Max Losers. I then evaluate the results against the Law of Reversal. Then if an indicators prior strikes me as being helpful to this one, I might lace them together looking for synergy. Both indicators must be built from the Law of Direction and Law of Sentiment. If I am looking for short, I had better see short entry points. If I am looking for long, I had better see long. Once I am satisfied I make a tpl out of it and send it on to the nets.

Now once I have something that I can rely on I move to the nets and the indicators as an input to a net. I run the nets plain Jane first and see what the net is going to do with it. If it looks exciting I add it to a Trading Strategy and see how it rates. I then run the optimizer to Max Net Profit. I do this because I include slippage of .20 in all of my testing. I am only looking for the real world when it comes to these trades and slippage is real. I know that there are a lot of people that beat draw down into a pulp but it is not part of my trading system. I just have not seen any value in worrying about it. If you are not making any money on your trades it is obvious. As for money management. Never trade more than 2/3 of your margin and if you lose consistently over the last 3 trades, stop trading and evaluate your problem.

I hope this helps,

Steve

order of inputs in prediction
Date :5/8/2002 5:24:53 PM Poster : Patrick

following situation:
1. take a daily chart from any stock
2. make a new prediction with
a) inputs CCI, MACD, RSI (all inputs with default parameter values)
b) default prediction (Change 10 days ahead)
c) FULL OPTIMISATION
d) for all other parameters take default values

now, you will get different results (eg: contribution factors) depending on the order of defining the input indicator. eg. you define first CCI, second MACD, third RSI. the contribution factors are different if you take first CCI, second RSI, third MACD.

in a first test I had for example contribution factors of (0%, 0%, 100%). In a second test I had contribution factors of (0%, 33%, 66%).
As we can see, the difference is significant.

Does anyone has an idea if this is normal behavior?
If yes, does anyone knows the reason?

thanks for any comments.
patrick

Re: order of inputs in prediction
Date :5/9/2002 8:22:09 AM Poster : Texas Bubba

Yep it is. First off, take a peek at the post on this sight in the bugs section that esplains it all about net inputs order. On top of that you are optimising, so since the generic algorithm starts with random inputs I think for sure you could get different settings on the parameters of them inputs when their moved. Then for sure your contributions will be different.

How to display optimized indicators

Date :5/9/2002 6:14:59 AM Poster : Hans Friedli

Hi

I have an optimized trading strategy with entry stop price and a long trailing stop -both based on an indicator. It's a multiple sheet chart with say 10 different stocks. Now i'd like to be able to chart the stop indicators for each stock/sheet based on the optimized values for this stock an not based on the values i entered for this indicator when i added it to the sheet. Is there a way to do this with NSTP?
Generally spoken - is there a way to access and chart optimized values/indicators from strategies?
Making different .cht files for each stock and manually entering the optimized values from reading out the trading rules is NOT the solution i'm looking for.

thanks for your ideas
Hans

Saving Alerts

Date :5/10/2002 6:44:45 PM Poster : Maciej

Hi,
Has anyone found a way of saving alerts? I can save indicators but not alerts it seems even though I can rename them. I generally add alerts to my production charts and would like to speed up the process in much the same way as I do for indicators.

Using NST with Tradestation

Date :5/12/2002 8:37:57 AM Poster : Dan Kinter

A reminder: I am a newbie. Also, I want to thank those that gave me advice in my previous posts. Now my thought.....

I have NST and also have Tradestation 2000i. It seems to me that this combination has some advantages: In addition to having the NST's enormous power for system development (including neural nets and genetic algorithms), I have TS which (1) TS permits one to work with tick charts (in addition to time frames) and also to work with any short term time frame (2) TS has "Showme" which can graphically display the point when any number of things are true (3) TS has super charting abilities.

My thought is to use NST (a far superior product for system development) to develop a system and then "fine tune" and apply it in TS. Doesn't this make sense to you? Any experience with this?

Can ALL indicators developed in NST be transferred to TS? Is this true? Any experience using BOTH products together? in transferring data, indicators, etc. back and forth?

I want to make clear that I believe NST is both (a) far superior than TS (b) absolutely essential to develop a trading system.

Any thoughts are appreciated. Thanks in advance.

Integrated - automated trading

Date :5/15/2002 10:41:35 AM Poster : Steve Ward

Just so that everyone knows what Steve K has already known for some time, Ward Systems has already programmed a limited but general purpose integrated trading, which is waiting for a future release, or could become an addon of some sort. It has already worked on one popular broker, but it probably won't work for every online broker. I don't have dates or more details at this time.

If Steve K wants to sell his version, we support that and will help in do so (as we will help anyone wanting to sell an addon to our products, template, etc.), even after ours arrives. After all, he might very well have a better one, and might decide to get it ready sooner. Users can then have a choice. See NST Advice thread for info on what he did.

Some definitions might be helpful:

INTEGRATED Trading - A product which produces an order from a trading system and asks the user if they want to place an order with their broker (yes/no). If the user chooses yes, then the program places that order with their
broker through some means.

AUTOMATED Trading - A product which produces an order from a trading system and places the order with a broker WITHOUT asking the user if they want to place an order.

An integrated trading system would require a user to monitor the computer
all day and verify all orders before they are sent. An automated trading system would place trades while a user is out playing golf.

What we have programmed is integrated trading. Obviously it could easily be
turned into an automated trading system by simply not displaying a message
box. However, we aren't a broker/dealer (see Steve K's comment on that), and have not investigated what is required to become one.

I certainly see the appeal of an automated trading system, but using one would take real guts unless you have a system that has worked pretty reliably for a long time. You'd better be pretty sure of it.

Others have told me they are programming automated trading, not for resale but for their own purposes to specific broker interfaces. That's actually why we built the Data Exchange addon. It really isn't all that hard on our end, given the example we provide. The interface to the broker may indeed be hard. The main problem on our end, a limitation of the Trader's interface, is that it can't easily tell you which stock is to be traded unless you put each stock in a different chart. I hope in a future release we will be able to pass the ticker symbol, or at least a subchart number, making DataX altogether more useful. In the mean time, there are some primitive ways to discover the ticker symbol, like comparing the price of the first bar in the chart to the known first prices of all of the tickers in the chart (see the tip "How to build hedging trading strategies" for an indicator that will do that.)

Re: Integrated - automated trading

Date :5/15/2002 8:12:09 PM Poster : jk

Good news on all fronts. As NST works only with Quote.com data it would not be unnatural for the interactive version to work only with Datek or ????. I have done various experiments (before the open and simultaneous phone calls with various brokerages) 6 mo. ago to determine who has the best fills. I found Ameritrade to be the BEST by only fractions (1/16 of a point over the rest who were all very very close). So in my opinion an E-broker is an E-broker. This was recently confirmed in the latest issue of Forbes.

On the Integrated vs. Automated side...

1) I know lots of disgruntled TradeStation traders who might switch to NST if something like this was made available. The TS traders have been absolutely abused by buggy product and NO support. These traders have been ripped off by Omega Research and are HIGHLY suspect of their trading/brokerage system TS6. I could go on and on about the Omege research issues, but that is not the point. There is a huge untapped customer base for a solid player.

2) It seems like some redundant work is going on (automated order entry) with no synergy. I would think these efforts are better off towards a community sharing ideas on systems/philosophies/books etc etc. I must say the Omega Discussion Group is a VERY lively crew with some talented contributors. JMA vs. triple smoothed moving average were compared years ago with plots etc etc.

I do not underestimate the significance of the legal issues. However, it seems that there might be some simple ways to get around the most obvious issues. I would think that all Open orders might REQUIRE a simultaneous close order (dollars or % change or price target) as a safety net in the event the trading computer goes down/heart attack etc etc. Again, Omega Research HAS automated trading capability they are simply not credible. However, they have lawyers too so that would make the boiler plate readily available-copy/paste.

In conclusion- I want the automated trading system.....so do others. Why wait for Omega Research to become credible or be the only game in town ? Obviously an automated system is close .....finish it (anybody) before somebody else takes the money off the table.

Regards,
JK

INTEGRATED Trading - A product which produces an order from a trading system and asks the user if they want to place an order with their broker (yes/no). If the user chooses yes, then the program places that order with their
broker through some means.

AUTOMATED Trading - A product which produces an order from a trading system and places the order with a broker WITHOUT asking the user if they want to place an order.

An integrated trading system would require a user to monitor the computer
all day and verify all orders before they are sent. An automated trading system would place trades while a user is out playing golf.

What we have programmed is integrated trading. Obviously it could easily be
turned into an automated trading system by simply not displaying a message
box. However, we aren't a broker/dealer (see Steve K's comment on that), and have not investigated what is required to become one.

I certainly see the appeal of an automated trading system, but using one would take real guts unless you have a system that has worked pretty reliably for a long time. You'd better be pretty sure of it.

Others have told me they are programming automated trading, not for resale but for their own purposes to specific broker interfaces. That's actually why we built the Data Exchange addon. It really isn't all that hard on our end, given the example we provide. The interface to the broker may indeed be hard. The main problem on our end, a limitation of the Trader's interface, is that it can't easily tell you which stock is to be traded unless you put each stock in a different chart. I hope in a future release we will be able to pass the ticker symbol, or at least a subchart number, making DataX altogether more useful. In the mean time, there are some primitive ways to discover the ticker symbol, like comparing the price of the first bar in the chart to the known first prices of all of the tickers in the chart (see the tip "How to build hedging trading strategies" for an indicator that will do that.)

Re: Integrated - automated trading

Date :5/16/2002 1:28:55 PM Poster : Jimmy Raineri

Seems to me that any automated trading system is going to only be as good as it's data feed. Not only the accuracy of the data - slow or bad ticks, but the connection itself. Can't imagine depending on Quote.com for much of anything in the way of accuracy or connectivity.

On 5/15/2002 8:12:09 PM jk wrote:
Good news on all fronts. As NST works only with Quote.com data it would not be unnatural for the interactive version to work only with Datek or ????. I have done various experiments (before the open and simultaneous phone calls with various brokerages) 6 mo. ago to determine who has the best fills. I found Ameritrade to be the BEST by only fractions (1/16 of a point over the rest who were all very very close). So in my opinion an E-broker is an E-broker. This was recently confirmed in the latest issue of Forbes.

On the Integrated vs. Automated side...

1) I know lots of disgruntled TradeStation traders who might switch to NST if something like this was made available. The TS traders have been absolutely abused by buggy product and NO support. These traders have been ripped off by Omega Research and are HIGHLY suspect of their trading/brokerage system TS6. I could go on and on about the Omege research issues, but that is not the point. There is a huge untapped customer base for a solid player.

2) It seems like some redundant work is going on (automated order entry) with no synergy. I would think these efforts are better off towards a community sharing ideas on systems/philosophies/books etc etc. I must say the Omega Discussion Group is a VERY lively crew with some talented contributors. JMA vs. triple smoothed moving average were compared years ago with plots etc etc.

I do not underestimate the significance of the legal issues. However, it seems that there might be some simple ways to get around the most obvious issues. I would think that all Open orders might REQUIRE a simultaneous close order (dollars or % change or price target) as a safety net in the event the trading computer goes down/heart attack etc etc. Again, Omega Research HAS automated trading capability they are simply not credible. However, they have lawyers too so that would make the boiler plate readily available-copy/paste.

In conclusion- I want the automated trading system.....so do others. Why wait for Omega Research to become credible or be the only game in town ? Obviously an automated system is close .....finish it (anybody) before somebody else takes the money off the table.

Regards,
JK

Re: Integrated - automated trading
Date :5/16/2002 5:14:17 PM Poster : zawie

I've thought about this many a time, and I'm soon to embark on developing my own automated trading interface. (And I won't be selling it because of liability)

My main concern (which applies to all automated trading systems), is reliability. No brokerage or quote system, internet connection or PC is 100% reliable. Even neuroshell can (and does) crash, windows will give the blue screen of death. I.E. There are a lot of variables (and a lot of liability). Any point can fail, but there are moves you can make to reduce the possibility. Duplicate PC's, duplicate ISP's, running a reliable OS.

If you're trading stocks and can place stop orders, then that removes a considerable amount of the risk, but not everything.

The solution I'm planning to the problem is:

Order Processing: Order processing happens on a unix machine (due to reliability). If the order fails for any reason, I get paged. The unix machine sends out a heartbeat every hour or so. Every trade is paged. The program on the unix system, listens for incoming trades from the PC running neuroshell and acts accordingly.

Equity Management: The unix program maintains an equity curve. If there is any abnormal deviation from this curve, all trading is shutdown pending operator intervention. There is a trading activity limit in effect, which will shutdown the system if too much trading is happening.

Testing: Test, test and retest. Fault monitoring is critical. And finally, test again.

Them my thoughts.
Mark

It is relatively easy to access the InteractiveBrokers.com API from Excel or C++
Considering that DataX can be interfaced to Excel or VB (a free sample Excel add-on is available on my ForeTrade.com website), building an automated trading system is quite possible.

Very true, an API saves alot of work if it is well put together. Ward also included a VC++ example in their DataX Add-on. Most of the brokers out there have an API interface now for their systems. The subject of the post you replied too was the delicate legal aspects of a truly automated system, which far outweigh the simplicity of the act of launching the order automatically.

I hope this helps,

Steve

JMA

Date :5/15/2002 10:46:11 AM Poster : Steve Kratochvil

I have just got the JMA and compared it against the TEMA quite extensively. Here is my opinion. The JMA is superior. Now lets talk about things. If you compare the TEMA9 (that I have built major portions of my system on) to the JMA 5 with 0 Phase you will be astonished to see how close they are. The TEMA is a very strong indicator and worth keeping around for its behavior nuances. Things that make the JMA superior are the smoothing of the false sharp mini wiggles that TEMA has, the ability to adjust the tradeoff between lag and overshoot and JMA is quicker at getting to the direction of the trend. I say this with the knowledge that the TEMA is still a very solid indicator and should not be overlooked or discarded. If you need just a slight bit more exaggeration than JMA in your signal use the TEMA I have sent up before.

Ditto programming language and money management

Date :5/17/2002 12:26:41 PM Poster : fhealy

I would like to echo the previous sentiment that including a programming language and enhanced money management features in NST would be an excellent idea. I have noticed that in at least one other case, a software product used in stock trading has a built in capability to convert Easylanguage code into their version of a programming language. For Tradestation users like myself who are looking to fully convert to NST this would help quite a bit. As for money management, one simple step that would help is to include additional information in the Alert window, such as the number of shares bought or sold for each alert.

A dissent re: programming language and money management

Date :5/20/2002 4:06:16 PM Poster : Steve in California

Thought I'd express a different opinion on the benefit of a "programming language" for NST and agreement on the need for more on money management.

IMO, one not-mentioned-often benefit of NST is the fact that using the tool takes the focus off "programming" and puts it on trading concepts, indicator construction, and indicator evaluation. "Control" of evaluating trading strategy rules is done by NST; something that in a programming language like EL one must do oneself. It seems to me that it would be a very significant effort to integrate a "procedural language" compiler into NST that worked alongside or in conjunction with its current non-procedural strategy specification wizard. (If I had a vote) I'd vote against spending precious resources on development or integration of a programming language for NST.

That being said, what's needed, IMHO, is a more sophisticated (but still non-procedural) approach and interface in the trading strategy wizard. One that allowed for the specification of more sophisticated exit techniques (partial position exists, etc.). It would be great too if the trading statistics included Sweeney's MAE and MFE.

Re: A dissent re: programming language and money management

Date :5/20/2002 10:03:33 PM Poster : Steve Kratochvil

I agree with both comments. The indicator wizard needs to be reworked and NeuroShell needs a language of it's own. Here is a list of things that I sent to Steve Ward one day. He asked so I sent.

NeuroShell Day Trader improvements.

1 Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.

2 Produce the exact optimized parameter settings for a Re-named input in the final report.

3 Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.

4 Allow the option for priority of trade to be set entry, exit or stops.

5 Developing a BASIC / Trade Expression Language for NeuroShell.

6. Graphing of the grid of prices and/or time across the chart in lite gray color.

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data... or allow you to drag indicators off the chart.

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.

9. Allow the size of each chart area to be adjusted by dragging up or down.

10. Allow more than 6 charts.

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.

12. Allow for more colors in the color bar.

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".

14. Trading Strategy performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.

I now have some more, not to diminish the importance of list mentioned above.

18. Allow stocks to overlay inside a chart and allow linking of charts

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator

There will always be more, just give me time. So with that in mind, I set out to take what I do have and make it work. I will not stop prodding or poking at desired improvements. I must say that the M3 data server was one of the best moves yet. Kudos to Ward Systems.
To this end I am conceptualizing a NeuroShell Indicator/Language Wizard. I think I would do it this way. I would take a script language and modify it for NS wrap it in a redesigned indicator wizard GUI to build tpi's. I would then have it squirt out .bas files that it would compile into the dll's and place them in production. Compiled code is a must. I would even approach it like VBA or macros in Excel, only with the ability to compile and with a bit more on the GUI side. This is just the first concept that could be done leveraging the current system. I am still thinking. I truncated this message because I found myself brain storming from here to page 3. I understand both schools of thought and agree with them both.

Excellent list. If I may add a small item to the list of possible improvements with regard to money/trade management: Add the ability to select a rounded (up/down) number of shares to the "Buy fixed dollar amount of shares" and "Buy as many shares as possible . . .", to the Trading Strategy Parameters/General window, and to any other future related trade size selection parameter, i.e., 10, 100, 1000 share lot sizes, etc.. It may or may not make an appreciable difference in strategy optimization but I'd like to see optimizations that reflect round lot trading.

I agree with both comments. The indicator wizard needs to be reworked and NeuroShell needs a language of it?s own. Here is a list of things that I sent to Steve Ward one day. He asked so I sent.

NeuroShell Day Trader improvements.

1 Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.

2 Produce the exact optimized parameter settings for a Re-named input in the final report.

3 Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.

4 Allow the option for priority of trade to be set entry, exit or stops.

5 Developing a BASIC / Trade Expression Language for NeuroShell.

6. Graphing of the grid of prices and/or time across the chart in lite gray color.

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data? or allow you to drag indicators off the chart.

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.

9. Allow the size of each chart area to be adjusted by dragging up or down.

10. Allow more than 6 charts.

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.

12. Allow for more colors in the color bar.

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called ?Guided Optimization?.

14. Trading Strategy performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.

I now have some more, not to diminish the importance of list mentioned above.

18. Allow stocks to overlay inside a chart and allow linking of charts

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator

There will always be more, just give me time. So with that in mind, I set out to take what I do have and make it work. I will not stop prodding or poking at desired improvements. I must say that the M3 data server was one of the best moves yet. Kudos to Ward Systems.
To this end I am conceptualizing a NeuroShell Indicator/Language Wizard. I think I would do it this way. I would take a script language and modify it for NS wrap it in a redesigned indicator wizard GUI to build tpi?s. I would then have it squirt out .bas files that it would compile into the dll?s and place them in production. Compiled code is a must. I would even approach it like VBA or macros in Excel, only with the ability to compile and with a bit more on the GUI side. This is just the first concept that could be done leveraging the current system. I am still thinking. I truncated this message because I found myself brain storming from here to page 3. I understand both schools of thought and agree with them both.

Well, as long as this is turning into a wish list....

How about multiple time periods in a chart, number of bars/value since condition true, TSF, and Peak and Trough indicators, faster optimizing, the ability to save predictions/strategies for use in other charts, the ability to compare the rules and results of various strategies/predictions, scanning, and mechanical trading....S

Excellent though the wish lists are, they are likley to require considerable resources to implement. I'd personally settle for a less ambitious list as follows:

a) multiple time frames (I beleive that this may have been mentioned before)
b) Open Interest values when using quote.com / also the ability to get overnight sessions from quote.com.
c) A mechanism to better handle futures contracts - ie automatically pick up the next contract for a given commodity.
d) Give Alerts similar features to Indicators enabling them to be saved.
e) Making protective stops as explicit in their presentation as exits.
f) Allowing re-iterations when optimizing to be refined by setting an increment value. This should speed up the optimization process considerably. As an example when seeking the best value for a protective stop via the optimizer one could give for a grain commodity such as beans and increment value of 0.25 covering a range of say 2 to 50. It makes no sense to analyse and recommend an optimized trailing stop of 3.33 - it just leaves one with an additional decision whether this means 3.25 or should it be 3.50.
g) Again in the speed improvement area - I'd like to see the ability of NST to exploit multi-cpu machines perhaps multi machines via some sort of RPC mechanism. It seems fairly evident from studying the performance statistics of NST running under W2K that tweaking in this area could give useful improvements in performance.
h) An ability to create run-time modules so that a locked "production" chart could be used for trading separately from a development NST.

I guess that's all for the time being - it would be nice if Steve Ward could share his vision of future releases iof NST - is that possible?

>I guess that's all for the time being - it would be nice if Steve Ward could >share his vision of future releases iof NST - is that possible?

Ok, I can share the short term. We have a new release coming out hopefully before the end of the summer which has a number of substantial improvements that people have asked for, several on your list. It is already programmed and undergoing alpha testing by the programmers.

After that? There's no way we can hope to provide ALL of the features people want in a short time, unless you guys start helping us sell a lot more software by spreading the word about us (people believe other users more than they believe our ads or our salespeople). But we'll keep taking your suggestions and implement as much as we can.

The most often requested feature is another real time choice, which we should have. There'll be better charting and faster optimization, the ability to add tickers without making .lst files, and more. Some of the features will make it easier to use for newcomers without detracting from the power (remember, our continued profitability means attracting and holding new users). Those same features should make some of our older users more aware of what we ALREADY have in the package, which is a major problem for us right now.

Along with making the features easier to use and notice, we may have to do a better job of education. Take your #30 in the list for example. Genetic algorithms don't go through values by increments like ordinary optimizers do. They jump all around.

There'll be a chance to beta test this big new release. Watch this site for news of that.

Thanks Steve for giving us a hint of goodies to come in the short term.

I for one agree with you that more/better education is necessary to extract more leverage from NSDT which by comparison to other software is very sophisticated. Iinevitably few if any of us use all of the available features. I for one must admit that I'm finding out new nooks and crannies of NSDT on a regular basis.

However, whilst not disputing your assertion that genetic algorithms don't work in the same way as standard iterative do loops, what is being suggested by the enchancement #30 is whether a touch of genetic manipulation might not be appropriate to forstall the ga's evolution in blind directions, ie keep the good part just protect it from some of the possible but unworkable solutions. To take an example from programming, recursive routines in a programming language allow for the elegant expression of a common solution to a programming problem but in practice developpers often circumscribe such routines to avoid stack overflows and other errors.

If my memory serves me, Ward used to sell DSP boards or such like to help speed up the software. I doubt that that is a direction that should be revisted but any enchancemnet that helps speed up the genetic algorithm would be welcome.

d) Give Alerts similar features to Indicators enabling them to be saved.
e) Making protective stops as explicit in their presentation as exits.
f) Allowing re-iterations when optimizing to be refined by setting an increment value. This should speed up the optimization process considerably. As an example when seeking the best value for a protective stop via the optimizer one could give for a grain commodity such as beans and increment value of 0.25 covering a range of say 2 to 50. It makes no sense to analyse and recommend an optimized trailing stop of 3.33 - it just leaves one with an additional decision whether this means 3.25 or should it be 3.50.
g) Again in the speed improvement area - I'd like to see the ability of NST to exploit multi-cpu machines perhaps multi machines via some sort of RPC mechanism. It seems fairly evident from studying the performance statistics of NST running under W2K that tweaking in this area could give useful improvements in performance.
h) An ability to create run-time modules so that a locked "production" chart could be used for trading separately from a development NST.

I guess that's all for the time being - it would be nice if Steve Ward could share his vision of future releases iof NST - is that possible?

On 6/21/2002 5:45:40 AM Matt Schulz wrote:
Excellent list. If I may add a small item to the list of possible improvements with regard to money/trade management: Add the ability to select a rounded (up/down) number of shares to the "Buy fixed dollar amount of shares" and "Buy as many shares as possible . . .", to the Trading Strategy Parameters/General window, and to any other future related trade size selection parameter, i.e., 10, 100, 1000 share lot sizes, etc.. It may or may not make an appreciable difference in strategy optimization but I'd like to see optimizations that reflect round lot trading.

On 5/20/2002 10:03:33 PM Steve Kratochvil wrote:
I agree with both comments. The indicator wizard needs to be reworked and NeuroShell needs a language of it?s own. Here is a list of things that I sent to Steve Ward one day. He asked so I sent.

NeuroShell Day Trader improvements.

1 Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.

2 Produce the exact optimized parameter settings for a Re-named input in the final report.

3 Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.

4 Allow the option for priority of trade to be set entry, exit or stops.

5 Developing a BASIC / Trade Expression Language for NeuroShell.

6. Graphing of the grid of prices and/or time across the chart in lite gray color.

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data? or allow you to drag indicators off the chart.

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.

9. Allow the size of each chart area to be adjusted by dragging up or down.

10. Allow more than 6 charts.

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.

12. Allow for more colors in the color bar.

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called ?Guided Optimization?.

14. Trading Strategy performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.

I now have some more, not to diminish the importance of list mentioned above.

18. Allow stocks to overlay inside a chart and allow linking of charts

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator

There will always be more, just give me time. So with that in mind, I set out to take what I do have and make it work. I will not stop prodding or poking at desired improvements. I must say that the M3 data server was one of the best moves yet. Kudos to Ward Systems.
To this end I am conceptualizing a NeuroShell Indicator/Language Wizard. I think I would do it this way. I would take a script language and modify it for NS wrap it in a redesigned indicator wizard GUI to build tpl?s. I would then have it squirt out .bas files that it would compile into the dll?s and place them in production. Compiled code is a must. I would even approach it like VBA or macros in Excel, only with the ability to compile and with a bit more on the GUI side. This is just the first concept that could be done leveraging the current system. I am still thinking. I truncated this message because I found myself brain storming from here to page 3. I understand both schools of thought and agree with them both.

Steve

I would like to echo the previous sentiment that including a programming language and enhanced money management features in NST would be an excellent idea. I have noticed that in at least one other case, a software product used in stock trading has a built in capability to convert Easylanguage code into their version of a programming language. For Tradestation users like myself who are looking to fully convert to NST this would help quite a bit. As for money management, one simple step that would help is to include additional information in the Alert window, such as the number of shares bought or sold for each alert.

Re: A dissent re: programming language and money management

Date :7/2/2002 11:22:48 AM Poster : Steve Ward

It really isn't the GA which is slow. It is doing a pretty good job when you consider the dimensionality of the search spaces it has to work in when you give it a big bunch of indicators and parameters. It already does some local searching with small mutations of varying size. Increments aren't really an issue here. The problem is the time it takes to run through the data and compute profit thousands of times, especially if you are using any of the indicators that begin with "Trading Strategy:". Now in the coming release, we have sped those up somewhat, but even with that if you load up the GA too much, it's going to take a lot of time. The other indicators are already highly optimized for speed. The only good answer is parallel processing on several computers, which you have on the list. Until then try to use judgment about how much you throw at the GA, including keeping the number of bars reasonable.

Here are some tips I suggest everyone study:

When Optimization is Really Slow
Speeding up Overnight Optimization
NeuroShell Trader Batch Processing Capability

On 6/28/2002 5:52:42 PM Maciej wrote:
Thanks Steve for giving us a hint of goodies to come in the short term.

I for one agree with you that more/better education is necessary to extract more leverage from NSDT which by comparison to other software is very sophisticated. Iinevitably few if any of us use all of the available features. I for one must admit that I'm finding out new nooks and crannies of NSDT on a regular basis.

However, whilst not disputing your assertion that genetic algorithms don't work in the same way as standard iterative do loops, what is being suggested by the enchancement #30 is whether a touch of genetic manipulation might not be appropriate to forstall the ga's evolution in blind directions, ie keep the good part just protect it from some of the possible but unworkable solutions. To take an example from programming, recursive routines in a programming language allow for the elegant expression of a common solution to a programming problem but in practice developpers often circumscribe such routines to avoid stack overflows and other errors.

If my memory serves me, Ward used to sell DSP boards or such like to help speed up the software. I doubt that that is a direction that should be revisted but any enchancemnet that helps speed up the genetic algorithm would be welcome.

On 6/27/2002 7:50:54 AM Steve Ward wrote:
>I guess that's all for the time being - it would be nice if Steve Ward could >share his vision of future releases iof NST - is that possible?

Ok, I can share the short term. We have a new release coming out hopefully before the end of the summer which has a number of substantial improvements that people have asked for, several on your list. It is already programmed and undergoing alpha testing by the programmers.

After that? There's no way we can hope to provide ALL of the features people want in a short time, unless you guys start helping us sell a lot more software by spreading the word about us (people believe other users more than they believe our ads or our salespeople). But we'll keep taking your suggestions and implement as much as we can.

The most often requested feature is another real time choice, which we should have. There'll be better charting and faster optimization, the ability to add tickers without making .lst files, and more. Some of the features will make it easier to use for newcomers without detracting from the power (remember, our continued profitability means attracting and holding new users). Those same features should make some of our older users more aware of what we ALREADY have in the package, which is a major problem for us right now.

Along with making the features easier to use and notice, we may have to do a better job of education. Take your #30 in the list for example. Genetic algorithms don't go through values by increments like ordinary optimizers do. They jump all around.

There'll be a chance to beta test this big new release. Watch this site for news of that.

On 6/21/2002 7:10:55 PM Maciej wrote:
Excellent though the wish lists are, they are likley to require considerable resources to implement. I'd personally settle for a less ambitious list as follows:

a) multiple time frames (I beleive that this may have been mentioned before)
b) Open Interest values when using quote.com / also the ability to get overnight sessions from quote.com.
c) A mechanism to better handle futures contracts - ie automatically pick up the next contract for a given commodity.
d) Give Alerts similar features to Indicators enabling them to be saved.
e) Making protective stops as explicit in their presentation as exits.
f) Allowing re-iterations when optimizing to be refined by setting an increment value. This should speed up the optimization process considerably. Re: A dissent re: programming language and money management

Date :5/27/2002 7:35:43 AM Poster : Steve Ward

We aren't opposed to building some sort of trading strategy or neural net that allows partial exit and entry. However, prior to having a complete portfolio optimization system built in that reallocates funds amongst issues in your portfolio, it might not be as easy as you might think in the current system. Each user would need to specify some sort of indicator that tells the optimizer how to do partial entry and exit while it is optimizing, backtesting, and walk-forward testing. It should be good enough to make a difference in the final outcome, otherwise who needs it? Any ideas on how you would specify such an indicator?

By the way, those who are pretty good with Excel can build a compete portfolio optimizer in GeneHunter. It comes with one example, and any standard portfolio optimization techniques found in the literature surely can be done with GeneHunter. Some time ago I posted another idea on this forum, but it might be easier to find it on the GeneHunter forum.

DataX

Date :5/18/2002 7:43:22 PM Poster : Steve Kratochvil

To better help those of you that have been asking how to lock down indicators or have your indicator work that you do not wish to click through, locked down. I have a solution that will help you out.
This requires the DataX add-on and NeuroShell Day Trader Professional. This should speed up your testing and work flow.
In the example that I am providing I will use the AMA so that you will have all the parts necessary to run the chart.

What I am going to show, is how you can create an indicator, feed it out and back into NSDT by way of the DataX. In doing so you will insolate the indicator settings from the optimizer as you pass in the values of that indicator, for use with other indicators or net optimizations.

I have built a small app to assist you with the use of the DataX add-on. The app is required for this example and I have sent it up as DataXFileBuilder.zip. I have also included two tpl's (DataX File 1 and DataX File 2) as examples of how you handle each DataX File beyond 2 that you wish to add to this method. Download and install the DataX File Builder then place the tpl's in the template directory and the chart in the charts directory.

Requirements:
NeuroShell Day Trader Professional
DataX Add-on
DataX File Builder (see download. Run Setup.exe)
DataX File 1.tpl (see download. Place in Template directory)
DataX File 2.tpl (see download. Place in Template directory)
DataX Indicator Lockdown.cht (see download. Place in Chart directory)

Here goes nothing:

Step 1
Open the DataX File Builder
Build 2 files with 100 bars of data

Now you have File 1 and File 2 ready for data.
This must be done before staring NSDT.
Do not shut down the DataX File Builder. It is serving the files that will be used by NSDT.

Step 2
Open NSDT
Open the chart "DataX Indicator Lockdown.cht".

Step 3: Dissect the chart.
Now here is what you are looking at. Two AMA lines are plotted on the close. An indicator named "Long And Short Direction" is created to signal the crossover of the AMA lines. The "Long Entry" and "Short Entry" indicators are based off of the "Long And Short Direction" indicator. This simulates work you may have done.
Now the "Long Entry" is placed into "Put Data 1" and "Short Entry" is placed into "Put Data 2". The PutData indicators do just that, they put data into the File 1 and File 2 that you created with the DataX builder.
Following that, two indicators named "DataX File 1" and "DataX File 2" are special GetData indicators that do just that, they get the data out of the File 1 and File 2 that you created. They are tpl's. Reconstruct them to see how they make sure that the desired DataX File number remains unchanged.
The DataX File 1 and DataX File 2 indicators are used in a Trading Strategy that is Fully Optimized, and as you can see the settings of the indicator you might have worked on, are not changed even though the value of the indicators are used to make trading decisions or optimize something that needs to be optimized.

I hope this helps,

Steve

Open the DataX File Builder
Build 2 files with 100 bars of data

Now you have File 1 and File 2 ready for data.
This must be done before staring NSDT.
Do not shut down the DataX File Builder. It is serving the files that will be used by NSDT.

Step 2
Open NSDT
Open the chart "DataX Indicator Lockdown.cht".

Step 3: Dissect the chart.
Now here is what you are looking at. Two AMA lines are plotted on the close. An indicator named "Long And Short Direction" is created to signal the crossover of the AMA lines. The "Long Entry" and "Short Entry" indicators are based off of the "Long And Short Direction" indicator. This simulates work you may have done.
Now the "Long Entry" is placed into "Put Data 1" and "Short Entry" is placed into "Put Data 2". The PutData indicators do just that, they put data into the File 1 and File 2 that you created with the DataX builder.
Following that, two indicators named "DataX File 1" and "DataX File 2" are special GetData indicators that do just that, they get the data out of the File 1 and File 2 that you created. They are tpl's. Reconstruct them to see how they make sure that the desired DataX File number remains unchanged.
The DataX File 1 and DataX File 2 indicators are used in a Trading Strategy that is Fully Optimized, and as you can see the settings of the indicator you might have worked on, are not changed even though the value of the indicators are used to make trading decisions or optimize something that needs to be optimized.

I hope this helps,

Steve

Re: DataX

Date :5/20/2002 8:56:42 PM Poster : Steve Kratochvil

The technical reason is, this will allow you to mess around with indicator settings without building a tpl every time and getting it ready for the optimizer or sending out the data series as a file and re loading it as a data indicator. Once you have a solid indicator then a tpl is in order or a dll. I am just trying to give people options that might help them out with their development time.
One other reason is, I get great ideas from this stuff. These ideas have made money. So I am inspired to keep going. For example, if you read back in my other post "Locking indicators parameters in optimizations" I describe the Data Export and Import process for an indicator which brought me a very small yet powerful setting that I did not know all of it's behaviors. The concept of "Hidden from user" never even clicked that it would include the optimizer. But then it came from Steve Ward. I also checked the help file after that and it is stated there as well. If it had not been for Steve's post I would have never gone to that help file. If I keep putting things out here I will get more priceless information in return. I have acquired much more from the forum now that I have been producing information. So now that I have given people a way to use DataX who knows what may come back. So try it out and tell me what you think.
I am also thinking about starting a series of live charts that I am trading and toss them up here for feedback. I feel comfortable in the knowledge base here at the forum and know that I will get high quality input from highly educated participants. I would not do the same at Yahoo.

I hope I am helping, because it is sure helping me.

Steve

Steve, I'm afraid I don't understand. Why would one want to use the data x instead of saving the indicator and hiding the parameters?

On 5/18/2002 7:43:22 PM Steve Kratochvil wrote:
To better help those of you that have been asking how to lock down indicators or have your indicator work that you do not wish to click through, locked down. I have a solution that will help you out.
This requires the DataX add-on and NeuroShell Day Trader Professional. This should speed up your testing and work flow.
In the example that I am providing I will use the AMA so that you will have all the parts necessary to run the chart.

What I am going to show, is how you can create an indicator, feed it out and back into NSDT by way of the DataX. In doing so you will insolate the indicator settings from the optimizer as you pass in the values of that indicator, for use with other indicators or net optimizations.

I have built a small app to assist you with the use of the DataX add-on. The app is required for this example and I have sent it up as DataXFileBuilder.zip. I have also included two tpl's (DataX File 1 and DataX File 2) as examples of how you handle each DataX File beyond 2 that you wish to add to this method. Download and install the DataX File Builder then place the tpl's in the template directory and the chart in the charts directory.

Requirements:
NeuroShell Day Trader Professional
DataX Add-on
DataX File Builder (see download. Run Setup.exe)
DataX File 1.tpl (see download. Place in Template directory)
DataX File 2.tpl (see download. Place in Template directory)
DataX Indicator Lockdown.chl (see download. Place in Chart directory)

Here goes nothing:

Step 1
Open the DataX File Builder
Build 2 files with 100 bars of data

Now you have File 1 and File 2 ready for data.
This must be done before staring NSDT.
Do not shut down the DataX File Builder. It is serving the files that will be used by NSDT.

Step 2
Open NSDT
Open the chart "DataX Indicator Lockdown.chl".

Step 3: Dissect the chart.
Now here is what you are looking at. Two AMA lines are plotted on the close. An indicator named "Long And Short Direction" is created to signal the crossover of the AMA lines. The "Long Entry" and "Short Entry" indicators are based off of the "Long And Short Direction" indicator. This simulates work you may have done.
Now the "Long Entry" is placed into "Put Data 1" and "Short Entry" is placed into "Put Data 2". The PutData indicators do just that, they put data into the File 1 and File 2 that you created with the DataX builder.
Following that, two indicators named "DataX File 1" and "DataX File 2" are special GetData indicators that do just that, they get the data out of the File 1 and File 2 that you created. They are tpl's. Reconstruct them to see how they make sure that the desired DataX File number remains unchanged.
The DataX File 1 and DataX File 2 indicators are used in a Trading Strategy that is Fully Optimized, and as you can see the settings of the indicator you might have worked on, are not changed even though the value of the indicators are used to make trading decisions or optimize something that needs to be optimized.

I hope this helps,

Steve

S&P 500 Prediction

Date :5/19/2002 12:49:32 PM Poster : Bob

I wanted to know if anyone is aware of a fairly decent S&P 500 prediction or trading strategy that I could configure into my NeuroShell Trader using EOD data?

Thanks.

Bob-
Check out www.oddballsystems.com. That is great place to start-Mark Brown is a friend of mine so maybe I am biased. It is an hourly trading system that uses advancers /market breadth (data set 2) to get long/short the market. The system is very simple less than 10 lines in TS. I coded it in NST in 2 minutes. To convert it into a daily system is simple. However, the results after studying the SPX on a daily chart may lead you to conclude that it is not a good end of day tradeable. That knowledge in itself is VERY useful. You can stop looking for oil in a dead well. Moving on seems as important as digging in. Too Cliche' ? Sorry :-)
Also, I found it very interesting that a SIMPLE system like that is useful to many people who trade that thing. With so many options and so many optimizations etc etc etc. one can easily feel over whelmed. Folks on this board have suggested "concepts" to start creating useful systems. Concepts are great at the beginning and at the expert level. In the middle is REALITY. Getting an actual system that makes money NOW. While the account is going up- write more code and do more testing create more "concepts". At that point you feel like your getting paid to write code-kinda nice huh ?? Thereafter you can explore fractals/chaos theory .....and sound like a rocket scientist, while a 5 line systems pays the bills.
I hope you find the code useful.
P.S. After reading this -I do not know why my comments are so long rather than edit this one, I will try to shorten them in the future.
JK

Re: S&P 500 Prediction

Date :5/24/2002 7:51:56 PM Poster : jk

I pasted the ROC indicator help from TS. It describes the generic usage of ROC so do not be confused by the text. The RL(7), BZ(3), SZ(1) are just variables. See below for detail.
Hope this helps.
JK

Function

RateOfChange(PRICE,LENGTH)

Parameters

PRICE specifies which price of the asset of interest is to be used
LENGTH specifies the number of trailing bars to consider
Returns

A numeric value containing ROC for the current bar.

Usage

Analysis should not be limited to oscillators based on one time span but should include other periods in order to obtain a more complete picture of what is happening. For example, a trader may be using a 5 day ROC which moves easily between overbought and oversold extremes. However, as this 5 day span indicates an oversold region the other short term time spans does not confirm. This is why it is often a good idea to monitor several different ROC indicators simultaneously.

A word of caution, the rate of change must be judged as too erratic relative to some other indicators, such as moving averages. The reason for this seems to be because the equation for ROC has an over dependence on the oldest data.
The ROC indicator can be calculated in one of two ways: the subtraction method or the division method. The Omega ROC function uses the division method. The equivalent of the subtraction method is found in the Momentum function.
ROC = ((Price/Pricep) -1)*100

...where
Price = Current value (i.e., Close, High, Low, etc.)
Pricep= Previous value (determined by the value returned for the input LENGTH)
This formula is somewhat different from what you may see in some publications that do not subtract one. From an interpretive point of view it is immaterial which method of scaling is used because the general movements are identical. Omega Research prefers to use positive and negative numbers rather than strictly positive percentages, since this gives a better sense of bullish and bearish tendencies.

The parameter PRICE, is usually hard coded with some bar attribute such as Close, Open, High, Low, and Volume or is replaced with a numeric series type input. However, it can be replaced with a valid EasyLanguage expression. For example, Close + Open, or Average(RSI(Close,14),14).
The parameter LENGTH, just like the parameter PRICE, can be hard coded or can be replaced with an numeric simple type input. The value hard coded or entered as a default value for the input is usually number such as 5, 10, 14, etc. Once again, you may choose to replace LENGTH with a valid numeric expression. If you do decide to make it a numeric expression there is one thing to keep in mind. The value returned for the parameter LENGTH should be a whole number cannot change on a bar-to-bar basis.

Indicator Study: Outline

Date :5/21/2002 12:43:26 AM Poster : Steve Kratochvil

Here is an outline of indicator subjects that I am going to get into:

Adaptive Net Indicators
Classify and LagClassify
Predict

Adaptive Turboprop2

Clustering

Fuzzy Pattern Recognition
Fuzzy and FuzzyGA
FuzzyAND and FuzzyOR

Neural Indicators
Jump
Recurrent
Sparse
Ward

After talking about different time compressions at length with a friend of mine I am considering doing these indicators in three time frequencies 1min, 30min and Daily. If there is anything else that is of interest to anyone else in regards to setting up these indicators please let me know.

Thanks,

Steve

Amex SPY vs S&P500

Date :5/21/2002 5:13:03 PM Poster : Jeff Kilinski

What are the drawbacks if any, of using the Amex SPY as a proxy for the cash S&P index. The SPY comes with real intraday volume whereas the S&P is only tick counts. Without the volume stats, the historical index is difficult to model.

Indicator Study: Adaptive Net Indicators - Classify

Date :5/22/2002 5:45:24 PM Poster : Steve Kratochvil

Indicator Study: Adaptive Net Indicators - Classify

Required:
Adaptive Net Indicators (Add-On)
AdaptiveNetClassify.zip (See download file. This is a generic collection of example material that shows you how I use a Classify and LagClassify Nets. I built the charts so that you wound not need any other add-ons.)

The Classify Adaptive Net Indicator. Here is what I have done with these. 2 through 6 are the same only allowing more inputs. I first give the Classify Net a Boolean Actual target that I am trying to hit. Anything that has a bounded 1 to –1 result will make a nice actual. Then I place the indicators that support the actual target as the inputs. The input indicators need to be bounded or normalized so that when the Classifier runs it can make choices between equal weights. Boolean inputs seem to be best for a Classify Net but it can take others. Now that I have highly qualified indicators going in as inputs, I look at it to see if it is any good at a glance. This is where I look to see if it signaling at all the right times for excellent trades. I know that the help file said the Classify Net indicator gives a range of signal from 1 to –1 but I use it differently. I use one Classify Net to bring all the other indicators together that signal a buy and then I use another Classify Net to bring all the sell indicators together and signal that. I showed this in the examples. The Classify Net seems to do very well when given one mission so I usually set a penetration line for the positive side. I like adaptive penetration lines but the example has a static line. When I have decided how I am going to read the indicator I set up to optimize ONLY the Net parameters and of these I hid the Look forward parameter. Then once I have the optimizations values I print them out and so that I can put them in under the no optimization settings.
In the examples that I sent up you can see that the same settings for 1min are almost translatable to 30 min and farther to Daily, but in the end my example will not transcend markets and without other expert indicators used as inputs this example will not even survive its own market. Move the 1 min chart around on the dates a bit and you will see what I mean. It just shows you that you need good inputs and that bad inputs can be over fit to work for a little while.

I really like this net and usually add this net only to try and bring out the best in a generally successful system. It can be very useful at making best of breed choices, if it is given expert inputs.

Fuzzy logic output based on Standard Deviation

Date :5/24/2002 4:45:45 AM Poster : Robert Van Eyden

Hello All,

Can the following multiple fuzzy logic output be created. Lets assume the standard deviation for a bond yield (Buy and sell sell signals are wrongway around) over the last three years is 0.63 and the mean is 0.63. The ouput what I require:

If Yield >1 Std dev (0.63+0.63)=1.26 then buy
If yield <1 Std dev (0.63+0.63)=-1.26 then sell
If yield is 1.26>0.63 = a neutral buy
If yield is 0.63>-1.26= a a neutal sell

Can this be achieved

datafeed

Date :5/26/2002 11:56:01 AM Poster : mike olaughlin

i first started using this program in 97. i became disenchanted with dial data after i had trouble getting their data until late at night and chucked the whole NN thing. i've heard other people with the same problem so they're off the short list.

i signed up for quote.com live charts, but i can't seem to download their data either, though the program seems to connect okay. i tried to look at the data which is downloaded for marketbrowser, a free program that does basic tech analysis and does it well -- for free, but the info appears to be encrypted.

any other suggestions for low cost or free end of day data? thanks.

TD REI Indicator

Date :5/27/2002 11:01:24 PM Poster : Steve Kratochvil

If anyone has had an interest in the work done by Tom DeMark and his TD REI then here is a tpl of that indicator. It is designed to replace things like RSI. I have been poking at it for a little while now and thought I would pass it along. To find out how Tom meant for it to be used you can read about it in "New Thinking in Technical Analysis" by Rick Bensignor from Bloomberg Press. I have sent up the TD REI.tpl file. Enjoy!

Stochastic

Date :5/31/2002 12:09:35 PM Poster : Bill Carlson

Does anyone have on opinion using a stochasticon something besides price.

Perhaps DMI, OBV, VA, VELOCITY, etc.

Maybe some other type of spread, BOLLINGER, TRADING CHANNELS.

I'm running one now, but looking for an opinion from someone with more experience.

Thanks

I have even used two sets of Bollinger Bands around two STO indicators, one fast and one slow and looked for their relationships to Price. The real question that you need to ask is, "Does the STO of an indicator mean something". If it communicates a direct correlation to the Price or Volume then use it up, fix it up, and use it up some more. In fact most oscillators work better on conditioned or preprocessed data. This helps (does not cure) the dreaded, "FALSE SIGNAL AGAINST THE TREND".

News sites

Date :6/3/2002 11:09:34 AM Poster : Maxwell Craven

Anybody have any recommendations on internet sites to watch the business news? I've been monitoring yahoo but it seems to update only every 15 to 30 minutes. Often the market has reacted before I get the news about why it went the other way.

I do not know of a web site where this is fed to but if you subscribe to services such at ESignal, CQG or FutureSource a news window can be placed in your workspace. I have actually put a stop watch to some of the economic releases such as the employment report and the timeliness of ESignal and FutureSource spot on. You can open different windows with different news types in each window.

Screening appropriate issues

Date :6/5/2002 2:46:02 PM Poster : Jeff Kilinski

I am a new NSTP user and am looking for ideas on how to screen for appropriate issues to model. Using some of the stocks in the examples has helped but when I update data the dramatic selloff following Sept11 throws a monkey wrench in things. I started printing out long term daily charts to visually screen for the cyclical characteristics that would make an issue easier to model however that can get time and tree consuming. Anyone in the group have some pet tips on this?

Jeff

Including overnight trading sessions data

Date :6/6/2002 11:51:12 AM Poster : Dan Kinter

My ultimate goal is to trade the ES and/or the NQ intraday using very short time frames. Does anyone have an opinion on how significant (or insignificant) it is to study these futures (along with the SPY and QQQ) using data which includes or doesn't include the overnight trading sessions? Is it practical to develop a system only using the day sessions or it is really important to include the overnight sessions? Thanks for your help.

> ES and NQ have nite sessions but liquidity is very spotty. After the NorthAmerican markets close it will trade for a couple of hours and then dry up until London opens for trading, drying up during their lunch and picking up again as North America turns their machines on. Having said that, be very careful of the data you get during those time periods. Look at a 5 or 1 minute chart and you can see it.

Near Range Bar

Date :6/6/2002 1:23:57 PM Poster : Steve Kratochvil

The Near Range Bar indicator. If you have read "The Master Swing Trader" by Farley, this is an indicator to help you find the NR7 bars he described. I left it open so that you could adjust the actual bar count to something other than 7.

I have sent up a file name NearRangeBar.zip. It has the dll and tpl for this.

The file can be downloaded using the following link:

NearRangeBar.zip

To use this just unzip the dll and tpl into your template directory and select it from the custom indicators.

Re: Near Range Bar

Date :6/8/2002 12:27:41 PM Poster : Steve Kratochvil

The book "The Master Swing Trader" by Farley explains in detail all the many setups that use the NR7 in his book. In a nut shell it will determine if the current bar has the smallest body, compared over 7 bars. In this case I allowed you to set the bar count to something other than 7 if you so desire. Farley expressed that the NR7 is usually very important at a point when a trend change is going to occur. That is it.

Re: Near Range Bar

Date :6/14/2002 2:04:58 AM Poster : Mark Simpson (zawie)

I tried out the NR7, and it works well. Thanks Steve.

Here are some tips I've found for it's use:

30 minute bars work best, which is good for swing trading. I'm using it to trigger a long when the stock is deeply oversold. It also works for exits after that condition has been met. It nicely complements the other research I've been working on.

Have you tried WR7? Or NR7 with the last 2 bars having the smallest bodies?

Also, I noticed your NR7 can have different values, e.g. 0.25 or 1.0. How is a differing amount calculated? Is that also in the Farley book, or a Steve K special invention?

Re: Near Range Bar

Date :6/14/2002 2:01:01 PM Poster : Steve Kratochvil

Well, I am glad that you like it. I have looked at Farley's work and considered it for Day Trading only. I will get into swing trading when I have more money. I am very pleased that I have been able to help you out.

As for a WR7 (Wide Range) they are more than likely in the middle of a move and followed by an NR7, which is where you want to trade. I would also be very jittery about successive WR7's with the first one putting me into a bad trade with horrible slippage due to the range on the second WR7 and no real limited evidence that direction change is at hand or happening.

As for two NR7's together you can get that from what I put together. Farley stated that it was of significant meaning. I cannot confirm that.

There are two values present when my NR7 pops off. First, the Boolean condition of Yes or No which you get just because the bar is present or not. Two a precision value of the size of the Bar where 1.6 is equal to $.16 or .25 is equal to $.025. The reason I presented a value instead of just a 1 or 0 was because in the simple calculation I already had the value and just passed it out.
I also thought that the size of the bar giving the signal might also be of use to someone for predicting profit targets, providing some adaptive ability to another indicator or developing a MA off of it for some unknown reason. The simple truth is, that it is additional information that is present in the price action at that bar and I decided to provide it incase someone might find a use for it.

Thanks,

Steve

Borderline decisions

Date :6/6/2002 10:24:14 PM Poster : Bill Carlson

Does anyone use other sources such as VECTORVEST program to assist on borderline decisions, or do you just flip a coin.

Or as Steve Ward says, some gambles have to be taken.

Bill

Re: Borderline decisions

Date :6/7/2002 11:25:19 AM Poster : Maxwell Craven

I probably wouldn't go short if fundamentals are strongly up or vice versa. Of course strong fundamentals can't save a stock in a really bad market.

Re: Borderline decisions

Date :6/7/2002 1:54:23 PM Poster : Steve Kratochvil

I would apply a fuzzy indicator to find the shape to clear up any boarderline signal or I would not trade and wait for a clear signal because my indicators might be telling me the truth about the current market.

A Little Plus Sign

Date :6/7/2002 4:16:18 PM Poster : Steve Kratochvil

A little plus sign. I have almost never been happier than this moment. I have come up with many different ways to control how the optimizer can or cannot change a value. I have explored countless settings and produced many profitable indicators but I did not know about the little plus sign. I was having trouble with getting a setting set for optimizing a net in a trading strategy. Steve Ward pointed out that I simply click on the plus sign after the indicator was in the window and set the limits of the values. I was thrilled. I had no idea that this was where the functionality was. In a way this helps me fill in many issues that other indicators were built to accommodate, control or never could touch.
This gets back to the help files. I light of the fact that this is the second time that Steve Ward has helped me out with something that I should have gotten from the help files, I will begin to ready each help file in detail. It is sometimes the basics that can be the most important thing you ever learn.

Steve

Re: A Little Plus Sign

Date :6/8/2002 11:47:38 PM Poster : fhealy

There is an article under the Tips and Techniques section of this website that discusses locking indicator parameters where the little plus sign method is mentioned. In trying to duplicate that method I searched for several days trying to find out how to access the area opened up by the little plus sign, until I finally emailed NST to ask how it was done. Their email back to me explained the little plus sign's function. So, what the little plus sign did wasn't obvious to me and I was reading the tip that showed its use! I have probably looked at that little plus sign many times without realizing that it actually did something.

Let us take this opportunity to recommend that everyone re-view the training videos that come with NeuroShell, maybe a couple of months after you first receive the product. Things like the plus sign may not sink in the first time you see the videos, because you are trying to learn so much. It's like seeing a complicated movie the second time - you begin to "see" and "hear" details that didn't make an impression on the first viewing. We've put most of the important concepts in the videos. If you've had the product a while and didn't know about the plus sign, then please take time now and go through the videos again!

Re: A Little Plus Sign

Date :6/10/2002 9:52:01 PM Poster : Matt R

I certainly am not complaining, as I have been using the "little plus sign" for quite a while, but I recall it not being an obvious option/feature (and I am a former engineering propeller-head). In fact, I remember insulting you in privacy about you not allowing for any sort of constrained optimization. I suggest you make it more obvious in your help files.

Regards
Matt

What is success

Date :6/8/2002 3:45:42 PM Poster : Bill Carlson

When testing different systems, what is considered a success when analyizing a system?

What figures are considered, Return on Trades, Return on Acct, % Profitable Trades, All of those mentioned can all have positive numbers and yet the Current Network can display negative figures.

What ever is used, what number or target figure is acceptable?

Thanks

Re: What is success

Date :6/18/2002 4:52:51 PM Poster : Maciej

Couldn't agree with you more its not particularly easy. You'll have to isolate the factors that are paramount to you and work from there. I like net profit to start with, I don't like Annual Return on Account as that skews my expectations, I like a highish % profitable trades as I haven't got the nerves to sit through too many losers, particularly consecutive ones. I'd also watch out for a high deviation in results typically $ 1 all the time with the infrequent $10000 result - to my way of working thats bad.

Success is defined: 100% Percent Profitable Trades and Maximum Open Trade Drawdown is less than or equal to 10% of Net Profit.

Steve

Re: What is success

Date :6/19/2002 2:34:13 PM Poster : CBOTDOC

FOR A SYSTEM WITH AT LEAST 60-70 TRADES OVER A PERIOD WHERE VOLATILITY HAS NOT CHANGED DRAMATICALLY, HAVING A PROFIT FACTOR OF 5- OR6 TO ONE AND A STANDARD DEVIATION OF AN AVERAGE LOSING TRADE LESS THAN 2 TIMES AN AVE WINNING TRADE IS A STABLE METHODOLOGY. PLOTTING MAXIMUM ADVERSE EXCURSION AS A FUNCTION OF AVERAGE WIN (OR EVENTUAL AMOUNT OF CLOSED TRADE EQUITY FOR THAT TRADE) ALSO IS VERY VALID. CLASSIFYING ALL TRADES (FOR SPECIFICITY AND PROJECTED PROFITABILITY) AND PROSPECTIVELY ADJUSTING STOP AMOUNTS DRAMATICALLY RAISES THE PROFITABLITY. THIS OF COURSE DEPENDS ON A VALID PROFIT TARGET PROJECTION METHODOLOGY.

Personally I work to 200% Percent Profitable trades. A drawdown of 0%, and at least 300% return on anyone trade in 2 days.

Still haven't got a model that meets that criteria yet.

However, everyday I get a little closer :-)

Mark

Re: What is success

Date :6/22/2002 12:15:25 PM Poster : Steven Buss

On the road to reaching the goal that Steve Kratochvil defines below, it's good to know the point at which a system's %ProfitableTrades and ProfitFactor are "high enough" to establish a consistently smooth upwardly sloping equity curve. Seems to me that it turns out that that "high enough" equity curve is based on something less than 100% Profitable Trades.

The "Trading System Performance Viewer" Excel spreadsheet that I posted a month or two ago is a tool for figuring out where the get-the-equity-curve-smooth-and-upwardly-sloping levels are for the %ProfitableTrades and ProfitFactor trading statistics.

When you use this tool, I recommend making the inputs for these two statistics really low at first and keep pressing F9. Gradually raise them and continue to repeatedly press F9 until you get the minimum equity you're willing to trade. It's at that point that you know the MINIMUM numbers you're working to achieve.

I didn't phrase correctly what I intended to say in my note below. The next to last sentence in the last paragraph should read:

"Gradually raise them and continue to repeatedly press F9 until you consistently get the minimum slope equity curve you're willing to trade."

Instead of:

"Gradually raise them and continue to repeatedly press F9 until you get the minimum equity you're willing to trade."

intermarket analysis

Date :6/9/2002 2:24:19 AM Poster : cbotdoc

try spreading the jy against the sp or oex , or the dollar index against an interest rate market (ty or us). you'll find them very tightly bounded with few periods of non-linearity in the last decade. using a difference of any of the off the shelf indicators will work, however accounting for both short term volatility and a "position in the chart" indicator together is better.

Macro Economic Data

Date :6/9/2002 2:05:52 PM Poster : Thomas Wagner

Can anyone direct me to cost efficient macro economic data that can be read by Trader Pro. eg. unemployment, new housing starts ect.
Thank you in advance

> I have been meaning to tinker with NS more, and build longer term models incorporating macroeconomic variables has been among the list of to-do's. My interest in economics predates my use of NS or financial markets in general. A broad non-specific suggestion, do not be lured into paying for economic data. Why? Because, you can often find data that arrives via the same source or you can find a proxy that will suffice in most reasonable situations (with regard to usage as an independent variable in modeling to capture some factor). My next much generalized suggestion: Learn and accept the responsibility of general data scrubbing. I know of NO sources that guarantee "Neuroshell Compatible Data" for macroeconomic time series. However, terabytes+ of data exist with the sole intent of usage in time series modeling. You will merely have to be sure the file format is of a readable type and headings are correct (generally erroneous and missing data will be "pre-scrubbed").

INDICATOR: A>B>C>D>E

Date :6/11/2002 10:57:18 AM Poster : Dan Kinter

(I hope this isn't too dumb a question) I have a need for an indicator which expresses A>B>C>D>E, or, A<B<C<D<E, but I can't figure out how to do this. I know the Relational Indicator already expresses A>B>C and A<B<C but I need one which expresses 5 components rather than 3 components. Is there some simple way to construct such an equation? perhaps using the relational indicator plus a bunch of lags? What I am trying to do is to create a condition in which each of the most recent bars of some indicator (such as Momentum) is higher/lower than the last bar up to say 5 bars. Any help is appreciated.

Volatility DLL - Download

Date :6/13/2002 12:45:38 PM Poster : Mark Simpson (zawie)

(Zip File - VolatilityV09a.zip sent to support@wardsystems.com for inclusion)

Here's the Volatility DLL as per previous email. Installation instructions
are contained in the README.txt in the zip file. The indicators also have online help and an example chart.

The Volatility DLL for Neuroshell Trader contains six historical volatility calculations. All the indicators included show similar results, they just differ in their calculation and some are considered closer to the "Real Picture" than others.

Historical volatility can be calculated over different time frames. E.G. You could calculate a 52-week volatility and then compare it against a 21-day volatility to see whether an equity was trading below or above it's 52-week value.

For calculating a historical volatility that approximates most options volatility calculations, use the Close to Close Method and a 21-day period.

The volatility indicators don't imply any direction in price but they can be used in conjunction with other indicators to help time trades. E.G. When a stock has low volatility, it can be consolidating, so it could be a good time to enter a trade. Conversely, when a stock reaches a high volatility peak, it might be a good time to exit.

Adding the volatility indicators to a good working neural net will often improve results.

I'm providing these indicators to foster activity on the forum. If
you find these useful, please post an example chart. It takes time
to prep these for public use, but I have many more indicators I've built, that I will start releasing if people are using them.

Regards
Mark Simpson (zawie)

contract count

Date :6/13/2002 2:53:38 PM Poster : Xprogrammer

Does anybody know how I can see the number of contracts in play that are long and the number of contracts in play that are short while I am day trading? I mean for the particular futures contract I want to trade. Are those called "open contracts" or what?

Re: contract count

Date :6/15/2002 12:29:27 AM Poster : Bruno

"Open Interest" is only calculated EOD.

If I'm not mistaken, your data feed may give you the DownTicks and UpTicks, along with Bid Size and Ask Size, but that's about all info you can get.

Bruno

On 6/13/2002 2:53:38 PM Xprogrammer wrote:

ONE CHART; SAME INDICATOR, DIFFERENT ISSUES

Date :6/18/2002 11:48:26 AM Poster : Dan Kinter

I would like to place on the same chart the indicator line of the same indicator but for different issues, i.e. one chart which displays the 5 min MA of the SP AND the 5 min MA of the ND. Obviously this is a normalization issue. It seems to me I have to make an ASCII file of both and then normalize the price axis and then display both files. Can someone help me through the steps to accomplish this? Is there some simple way to do this??? Many thanks for all help.

Re: ONE CHART; SAME INDICATOR, DIFFERENT ISSUES

Date :6/18/2002 3:33:22 PM Poster : Xprogrammer

Load SP into the chart. Then load ND (use other instrument data). Then apply MA to each in turn. Drag one MA into the same part of the chart as the other. If they are at different levels and you want to bring them up to about the same level, then insert a multiply2 indicator and multiply one of them by some appropriate factor.

On 6/18/2002 11:48:26 AM Dan Kinter wrote:

Hidden neurons

Date :6/18/2002 5:27:20 PM Poster : Bill Carlson

Is there any rule of thumb on how many neurons should used per issue, or parameter, or time period duration, or whatever?

Or is it just trying different settings: hit or miss..

Re: Hidden neurons

Date :6/18/2002 5:30:06 PM Poster : chris wong

i just use atp2 plugin and then the optimizer finds the right number to use.

On 6/18/2002 5:27:20 PM Bill Carlson wrote:

Re: Hidden neurons

Date :6/19/2002 2:33:49 PM Poster : Bruno

As little as possible, providing you still get good performance of your neural net.

TurboProp2 is quite a good neural net architecture and learning algorithm, but like most (if not all) feed-forward neural networks, if you use too many hidden neurons, your neural net may tend to memorize patterns from your training set, i.e. does not learn well the patterns 'hidden' in your data, and if you don't use enough hidden neurons, your neural net may not have the ability to learn at all the complex non linear features in your data. (by the way, you don't need hidden neurons to pick up linear features in your data)

In my opinion, the only good neural net, is the 'pure' Min-Error (and its counterpart Max-Correl) neural network. The other ones are more complex, and make it more difficult to focus on the quality of your inputs and model. So, assuming you agree on this, I would use few hidden neurons and add hidden neurons until you see very little improvement in the training error.

TurboProp2 already does that for you as it trains the neural network.

Now, to give a more down-to-earth kind of answer: my models use max 5 to 6 entries, with max 10 to 15 hidden neurons. Again, generally smaller is better.

Hope this helps
Bruno

Overnight gaps

Date :6/21/2002 1:05:07 PM Poster : Darek

Hi everyone,
has anybody tried to predict overnight gaps before the end of session?
Darek

Re: Overnight gaps

Date :6/21/2002 1:36:06 PM Poster : Steve Ward

Yes, I built some models like that not too long ago that worked out at least in the range 55%-60% correct trades. I never did any extensive model building or trading with them because I got interested in another scheme. But I think it is a very fertile area to try. The main problem is that there aren't very big gaps most of the time, so as I recall, I entered near the end of the day and exited not at the beginning of the next day, but maybe a half hour to an hour later, thinking that the trend overnight would continue a while in the morning. I may have let the optimizer adjust my exit time. For entry rules, I used time=4pm (or maybe it was 4:05 pm because I was using QQQ, but I don't recall exactly). Then for the second entry rule, I used either a neural indicator or a cluster indicator. Can't remember the inputs to those, but they may have been as simple as the spread% between the close and previous DayOpens, and /or the spread% between previous DayOpens and the DayClose the day before. I probably added something else like a regression slope over the current day, or maybe a stochastic or RSI.

On 6/21/2002 1:05:07 PM Darek wrote:

Wish List June 22 2002

Date :6/22/2002 3:49:17 PM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

2. Produce the exact optimized parameter settings for a Re-named input in the final report.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.
Added – June 22, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

14. Trading Strategy speed performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.
Changed – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.

Added – June 22, 2002

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.
Dropped – June 22, 2002. Already in the trader. Look very closely.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

21. Different Time frequency/compressions on one chart
Added – June 22, 2002

22. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Re: A dissent re: programming language and money management

Date :6/22/2002 3:52:06 PM Poster : Steve Kratochvil

Wish List Update 1. I think I will start reporting a status on these. The status will be one of three with a date: Dropped, Added and Changed.

I will give a response to all comments. Here we go in order of post.

Matt Schulz
1 Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards. Added.

Stewart
1 Multiple time frequency/compressions on one chart. Already on the list
2 Number of bars/value since condition true. You can already do this in the trader.
3 TSF ? Please spell it out for me.
4 Peak and Trough indicators. Please explain. At first glance I would say that this is what we are all trying to do. We are all trying to determine the High and Low for profitable trading.
5 Faster optimizing. Already on the list.
6 Save predictions/strategies for use in other charts. Added.
7 Compare the rules and results of various strategies/predictions, scanning, and mechanical trading. Please explain. This is what we are doing now. We build and compare to past results and build some more. What is it that you are trying to do that you cannot now?

Maciej
1 multiple time frames. Already on the list.
2 Open Interest values when using quote.com Added.
3 The ability to get overnight sessions from quote.com. Added.
4 A mechanism to better handle futures contracts - ie automatically pick up the next contract for a given commodity. Please explain. This is vague.
5 Give Alerts ability to be saved. Added.
6 Making protective stops as explicit in their presentation as exits. Please explain. This is vague.
7 Set increment size for the value range being checked in the optimizer. Added.
8 Multiple processor ability for improved speed and performance. Added.
9 An ability to create run-time modules so that a locked "production" chart could be used for trading separately from a development NST. Please explain. Do you mean to have a cht run separately without NSDT?

I will also look at this list and see if I can build the solution for some of these features. I encourage you all to do the same.

Thanks,

Steve

The specific contract has to be defined in a lst file that NSDT uses, ie 2020 Sep Soybeans will be SU2 or S02U (both forms are acceptable however the latter will not display the words Soybeans). Ideally I'd like to define my contract once, ie DJ, Dow Jones, Months traded are HMUZ, margin is 4500, point value and have NSDT pick up and use the current or specific contract month over and over again. I only use two systems for my trading and the other system has that type of facility which makes it more convenient. (the margin value could be useing to automatically populate the margin field in the trading strategy).
>
> 6) Stops to be handled by NSDT in the same manner as Exits (this is in a similar category to the idea of being able to save alerts): When looking at results of testing I'd like to understand how many times I was stopped out as opposed to exiting both on the chart and also in my statistics. I tend to trade on tight stops so the frequency of hitting stops is of importance. My current solution is to re-programme my stops as exits - but that's not particularly elegant.
>
> 9) Yes - run a cht without the development environment of NSDT. The reasoning is straightforward, when trading on a "production" platform one's not interested in development which should be run on a dedicated "development" machine. NSDT is heavy on resources so putting a development NSDT whilst trading can slow down a production machine even when using dual mprocessor with 1.5GB of RAM. Some guys have actually bought a second dongle but the assumption there is for a second development NDST which is not what is required for production. The "production" cht should be locked as you rightly point out.

Wish List June 24 2002

Date :6/24/2002 10:54:30 AM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

2. Produce the exact optimized parameter settings for a Re-named input in the final report.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.
Added – June 22, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

14. Trading Strategy speed performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.
Changed – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.
Dropped – June 22, 2002. Already in the trader. Look very closely.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

21. Different Time frequency/compressions on one chart
Added – June 22, 2002

22. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

Re: Wish List June 24 2002

Date :6/25/2002 10:37:04 AM Poster : Jimmy Raineri

I didn't see this one one there - IMO, it's the most glaring omission - and the only reason I no longer use Neuroshell -

- The ability to create charts in any time period - i.e. 7 minute, 121 min, or any minute based chart, along with the ability to create constant tick charts - i.e. 150ticks, etc.

Re: Wish List June 25 2002

Date :6/26/2002 10:29:51 AM Poster : Cantley

Now, the real key is to help prioritize this for WSG's development team. There are many good ideas on this list, which are the most urgent, or the highest return for the smallest development investment?

Best,
Steve

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

17. Overall a more user friendly, intuitive, visual experience for the user would enhance NeuroShell in ways that could set it apart as the only product to own.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

19. The slippage setting needs to reposition the entry and exit values rather than adjust profit computation for a more accurate representation of market activity. This would in turn be information used by the optimizer.
Dropped – June 22, 2002. Already in the trader. Look very closely.

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

21. Different Time frequency/compressions on one chart.
Added – June 22, 2002

22. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

34. Ability to select any time frequency/compression size desired.
Added – June 25, 2002

As for priority of features, now that would be another great piece of info that we should give. It could work something like this. Take the list, rank the top five things, and post it. Ward Systems would love to hear that. They might even pay for that kind of thing already from some marketing firm. We could help them out and maybe save them a buck or two. Who knows?

Steve

Re: Wish List June 25 2002

Date :6/27/2002 7:11:10 PM Poster : Maciej

Gentlemen,

It may be useful if the list were made into the following categories:

Application Functionl/Feature Enchancements: typically the type of different time frames enchancement.

Cosmetic: Items such as a larger palette of colurs, better print reports.

Technical: Perfomance related enchancements

Bug Resolution: ie the Open Interest or overnight sessions on Quote.com

Categorizing in such a manner may help Ward Systems better organise the developments. I don't know how specialised the developers are but often in developing software products there are the "application" specialists and the "technical gurus" for making the software work efficiently.

From a personal point of view the most useful improvemnt would be in the Technical area as that would allow me to get a more productive use of NSDT. The next would be the functional category but frankly it seems pointless loading even more features if the product lacks speed (my development already takes hours per test). For me the comsetic and bug corrections (minor bugs) come last.

Regards

Re: Wish List June 25 2002

Date :6/27/2002 1:59:37 AM Poster : Bruno

Many good things there...

I would add however:

n+1
Possibility to list/export a number of top genetic solutions. I am familiar with GAs and the "optimal" solution may be a statistical outlier. In my experience, the second or third best are usually better in the long run.

n+2
A free run-time NSDTrader module, which would collect data, crunch numbers and generate signals (with or without charting). It would be fast, and would leave NSTrader available for further development.

NeuroShell Day Trader improvements.

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

2. Produce the exact optimized parameter settings for a Re-named input in the final report.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles.
Added – June 22, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data... or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

14. Trading Strategy speed performance improvements. This seems to be a weak area and needs to be reviewed for what can be done.
Changed – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

Prioritized Wish Lists

Date :6/27/2002 11:20:12 AM Poster : Cantley

My top 5 (well, OK, three - the rest are cool ideas, but these are on my top tier)

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.

5. Developing a BASIC / Trade Expression Language for NeuroShell. (I'd LOVE to be able to type indicator formulas)

and

(New) Formula based money management -- allowing definition of risk per position and in a portfolio, and allowing positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Even better would be the ability to bypass a trade if the risk parameters were unacceptable, or if it would create too much portfolio risk.

I know that the new one is asking for a lot!

Best,
Steve

OBV

Date :6/28/2002 8:47:23 AM Poster : Bill Carlson

When doing a relation comparision of OBV 30 greater than OBV 30 Lagged. I would be looking for at least a loose correlation in the price increasing.
But how do you handle the situation when the result is negative: in this case from a minus 2500 to a minus 2900. The number is larger, but going down on the graph.
I entered this "greater configuration" for a Long Entry and checking against the Chart the OBV relation was negative.

Stochastics

Date :6/30/2002 11:14:41 PM Poster : Bill Carlson

Having a problem regarding high and lows The program refuses to acknowledge my instructions about not taking action unless that threshold has been reached.

I am getting results with a stochastic readings of 65 and 70 when the theshold requested was on the upper side of 80. The same is also true in reverse for the lower threshold of less than 25 and getting reading 35 and 40.

It should not make any difference, I am using a 21 day period.

Thanks

Re: Stochastics

Date :7/4/2002 8:43:45 AM Poster : Xprogrammer

What kind of instructions are you giving it?

Re: Stochastics

Date :7/6/2002 12:49:49 PM Poster : Bill Carlson

I had thought I had given the instruction that the stochastic had to exceed the upper parameter of 80 when reading came out to be in the 65 to 70 range.

The only other conclusion I can come to is the difference in which the stochastic is computed in different programs; the comparsion is to the one used by AIQ

That may be the answer.

Wish List July 1 2002

Date :7/1/2002 9:22:04 PM Poster : Steve Kratochvil

OK, here it is with updates and categories.

NeuroShell Day Trader improvements.

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Abililty to select any time frequency/compression size desired
Added – June 22, 2002
Changed – July 1, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.

Added – June 24, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine .
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature

Re: Wish List July 1 2002

Date :7/2/2002 10:28:29 AM Poster : Maciej

This list looks good Steve.

Another candidate for consideration in your user interface category:

Display Current / last value of symbol being shown on chart. Running real time its not really clear what the value is (the current red bar can fluctuate and its not very clear). If you look at a Qcharts example you'll see that the last value slides up and down on the right side of the chart.

Hello,
What about being able to selectively switch off optimizing on already optimized conditions in the trading strategy wizzard, but allowing only the newly added condition to get optimized ?
might make the optimizing much more handy
albert

Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature

Here is feature that I will throw out, even though I'm not sure it would have any mass appeal. I would be interested in hearing what other people think. When I open a new chart, I would like to be able to create a chart with an indicator as the primary data series, instead of a stock. When I run optimizations, I want it to look at the indicator when computing winners-losers (or any of the other fitness functions), AS IF the Neuroshell Trader was trading THAT indicator, not the stock the indicator is based on. I know you can implement trading strategies based on predictions of indicators, and there is an unbelievable amount of flexibility built into Neuroshell, but, there are limitations that can only be overcome by having the indicator be the primary series. -- Just my two cents.

OK, here it is with updates and categories.

NeuroShell Day Trader improvements.

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired
Added – June 22, 2002
Changed – July 1, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

An additional new feather to add...

For futures traders, I'd like a "bigpointvalue" sort of data file somewhere so that when running a model on a portfolio, I see dollars, instead of 500 cents in corn, and 15 cents in cotton, etc.

Best,
Steve

Each of the various sorts of futures contracts has a conversion factor that translates winnings and losses into real dollars. For example, a 1 cent move in corn is $50.

When you put together a chart with several commodities and run a test, you see $3.00 in corn (for $1500 real), 0.0045 in the Yen, etc. It's all over the place.

If we could put together a data file of the ratios (also called Big Point Values in several other applications), then running the test on a portfolio would show dollars for each commodity. As it is now, hand multiplications are needed.

Best,
Steve

This is already in the Trader unfortunately it does not work with the portfolio concept. If you go to the Trading Strategy and Modify Trading Strategy Parameters and go to the Costs Tab you can set the Point Value for futures contracts to the correct conversion factor. The rub comes in when you have more than one stock in the chart. The same conversion value is applied to all futures. This needs to be separated by future. I will enter your request as such.

Thanks,

Steve

currency day &night data and dataX
Date :7/2/2002 4:22:20 PM Poster : albertl

Hello,
can the dataX be used to feed data into the NST ?
there are now several dll currency data sources around ! (and they are even free of charge.)
has Ward Systems a solution / example code ready ?
If so, an upgrade to the daytrader will be the next step for most of the currency traders I believe..

The DataX can't really be used to feed in raw ticker data. It can be used to calculate indicators, and to export data like trading signals. However, our programmers are promising an API in which raw ticker data can be read in from a program. We would expect it in the next major release. If your currency data is in the form of a text file, of course you can read it in now - it just isn't practical for bars smaller than half hour bars.

NeuroShell Day Trader improvements.

Total Added: 40
Total Dropped: 5

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Abililty to select any time frequency/compression size desired
Added – June 22, 2002
Changed – July 1, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest valuea when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts abililty to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.

Re: Wish List July 6 2002

Date :7/7/2002 11:27:57 PM Poster : J

With regards to number 21, could this be modified to include continuously variable time values, for instance, not just a 1 min bar OR a 5 min bar, but anything in between. A simple slider at the bottom of the chart window could let you interactively slide the time value back and forth. Also, the optimizer could pick a certain time value for you.

Re: Wish List July 6 2002

Date :7/8/2002 11:23:24 AM Poster : Steve Kratochvil

Your request is exactly mentioned. The selection of any time frequency/compression size desired is exactly that. I will farther clarify 21 with an increment-sizing request. This means the setting the increment value to Seconds, Minutes, Hours, Days, Weeks, or Months can then be set with a numeric size for that increment of 1, 2, 3, 4, 5, 6, 7, 8, 9, etc… This is what selection of any time frequency/compression size desired is exactly.

The current choices given in the Trader cover all the common time increments and is very adequate for most observations and systems. The addition of the higher degree of control of your resolution might give you an edge when trying to front run something. That would be setting your time frequency to 9mins so that your signals slightly offset the 10mins and give you early signal that will closely match the 10mins about 30% of the time giving you an edge. This would also have the effect of putting you behind the 10mins about 70% or the time. This is where the dual or triple time frequencies need to be in the chart for comparison. And this feature is also mentioned in 21 and is far more critical than just expanding the selection of current time frequencies.

Thanks,

Steve

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.

Re: Wish List July 6 2002

Date :7/8/2002 6:41:30 PM Poster : Steve Kratochvil

Well, it will just inflate the number of shares purchased by the about of margin used. This directly translates to increased dollar values won or lost which is the same reason that people use margin in the first place. Try this on for size. Go to the Modify Trading Strategy Parameters then the General tab. Select "Buy as many shares as possible with current account balance". Put into the initial account balance your actual account balance. Then go to the Costs tab and set your Margin % per share to a normal value like "50%". Run your back test and take a look at what you have.

I hope that helped,

Steve

On a side note: Why did you call yourself "little small worm"?

On 7/8/2002 1:21:16 PM little small worm wrote:
hi steve,

when I check the margin $ per share/contract I encountered some incredible results (like 2500% !). In the nst help topic the calculation explanation is not very clear. could you give me some lights about it ?

thanks

Auto Trading

Date :7/8/2002 11:12:19 AM Poster : Andy Fisher

Has anyone implemented (or explored means of implementing) a way to feed the signals given by the NeuroShell Trader (or Day Trader) into a stock trading program? Any insight would be very much appreciated.

Re: Auto Trading

Date :7/8/2002 6:08:44 PM Poster : Steve Kratochvil

Do a search on "auto" and you should get most of the idea from past content.

Steve

Wish List July 8 2002

Date :7/8/2002 6:44:25 PM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

Total Added: 41

Total Dropped: 5

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.

hello Steve,
here are 4 more wishes:
1) another one about optimization:
partial optimization of the selected rules in the strategy wizzard:
f.ex you have 6 rules to choose from in the entry long menu
it would be nice to be able to force for example 2 conditions (to exclude them from the optimization by combinatio/selection process) and have them always to be true, while the remaining 4 conditions will be optimized , (may be with the choice 2 out of the four)
2) the print out of the optimization results should be much more easy to read,
as it is now I am unable to identify clearly the parameter values found by the optimizer
3) these same parameter values should appear also on the print out of a chart,
next to a clear list of the conditions and indicators used in the strategy
4) and also the chart and its printout should absolutely carry the file name
albert

Your first request is already on the list. Features - Number 38.
Your second request is already on the list. User Interface - Number 2. I will try and clarify it a bit.
Your third request is also part of Number 2.
Your fourth request is Added.

Thanks,

Steve

I have another feature I would like to see in the next Trader.

As we all know during an optimization process the results usually don't change
after a while. But we are forced to wait 20 minutes for example to see the results when most of the time the results have been the same since only a few minutes into the process.
So I would like the Trader to have some type of a timer than the user can set at will .

For Example: If you optmize a stock like NOC which trades a lot of shares
and you know that a 5 minutes optimization is enough, you could set that timer
to optimize all the other lesser volatile issues to 5 minutes or less.
Because if 5 minutes is enough for a stock with a lot of ticks it should be also enough for the ones with a lesser number of ticks.

I think this will save us all a lot of time.

Thanks

Hello Vince,
a similar means to save time would be to automatically stop the optimizer when the increment in the objective function f.ex. the profit is not changing sufficiently since a certain time say 30min
I do not necessarily mean the profit which is shown to us , the users, but the internal value the optimizer looks at when jumping around thru the paramaters he is optimizing
However I could imagine this might not agree 100% with the genetic optimizing
philosophy.
It would be perhaps more helpful to know according to what criteria the optimizer is stopping anyway ? This criteria is the one we should be able to modify, and not only the time !
albert

So I would like the Trader to have some type of a timer than the user can set at will .

For Example: If you optmize a stock like NOC which trades a lot of shares
and you know that a 5 minutes optimization is enough, you could set that timer
to optimize all the other lesser volatile issues to 5 minutes or less.
Because if 5 minutes is enough for a stock with a lot of ticks it should be also enough for the ones with a lesser number of ticks.

I think this will save us all a lot of time.

Thanks

On 7/8/2002 6:44:25 PM Steve Kratochvil wrote:
NeuroShell Day Trader improvements.

Total Added: 41
Total Dropped: 5

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions.
Added – June 22, 2002
Changed – July 1, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.

Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.

Calculation Confusion

Date :7/9/2002 4:35:21 PM Poster : Matt R

Quick question.....Why would I receive miscalculations when dividing UPVOL / TVOL (the qcharts advancing volume and total volume symbols) using closing values on 30 min bars? .....example of values I find suspect: last Friday (July 5th) I am receiving values around .1. However, when I manually check the data values (within the QCharts application), the results are much more reasonable (and I believe correct): ~.9. I am wondering whether I am missing something obvious, or alternatively if there is some error in NS. I suppose the possible error points are in NS importation of the data or directly in the calculation. Both of these seem like bugs/problems that would have already been discovered and remedied. Thus, I am inclined to believe my idiocy is once again validated.

Matt

Re: Calculation Confusion

Date :7/10/2002 7:52:00 AM Poster : Webmaster@ward.net

You can't check an NST calculation using Qcharts data. Check the calculation in NST using the data NST received from Quote.com. Everytime you log on to either NST or Qcharts you could get connected to a different server, and that often means at least slightly different data. Even logging on to the same server can mean different data as QC goes back and corrects data (we wish they would do more of that). Turn on the snapshot view and you will see the data NST is using. If you think the data is wrong take a look at the tip on this site called "Correcting Quote.com data."

wishlist/objective function

Date :7/11/2002 6:01:18 PM Poster : albertl

Hello,
Some time ago one of our friends here on this forum has made a strong case
for getting more freedom in objective functions.
He wishes to be able to set them more freely , preferably with some programming language.
I would already be quite happy if at least the objective " slope of equity function" was added.
albert

wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/11/2002 6:20:04 PM Poster : albertl

Hello,
I believe one should have the choice of optimizing in rough increments.
I know that the genetic optimizer is jumping around in the parameter spce, but It surely does this with certain increments.
These increments should be accessible to the user.
What sense does it make to have the space of 100 RSI points being divided into 10 000 steps with increments of 0.01
and have the NST running for days
and ending up with a nice OVER optimized model !
I want to set these increments myself, I would set them to 3 or 5 RSI points for example or to 3 or 5 pips in the trailing stop of a currency model.
!!!
Who knows anyway how these increments are set presently, do they make sense
really in all circumstances ?
A trailing stop of 0.01 dollar is way out of 0.01 pip in a currency which is not even quoted there

albert

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/12/2002 8:50:52 AM Poster : Steve Ward

You are incorrect. There are no increments in a standard GA. The GA does not work in increments as other optimizers do. It works mostly by genetic crossover of genes (as in biological gene crossover) and a little by mutation. Mutation adds or subtracts small amounts, but they are random and of random size. If you want to find out more about how a GA works, this book is in the reference section of the help files and can be found in any technical college library:

Goldberg, D. Genetic Algorithms in Search, Optimization & Machine Learning. Reading, MA, Addison-Wesley Publishing Company, Inc., 1989.

Those in my class can take a look at lessons 23 and 24 for an overview.

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/12/2002 9:40:01 AM Poster : albertl

Thanks for the reply,
may be I should not have used the word increment, but,
sorry to disagree, I do understand that the GA is jumping around the space of
numbers at random....but what is the space of numbers, how accurate do you measure, how fine do you divide the space/axis of your numbers ?
I maintain that the numbers the GA is allowed to jump at should be allowed to be reduced, i.e. the numbers on the e.g. x-axis could be only integers ,not real numbers or
mutatis mutantis may be 0,2 0,4 0,6 etc to 100 for RSI,
or the axis should be divided only in 0,3,6,9,12 etc
By the way, can you tell us how small is the smallest "increment" your NST is using in trailing stops, what sense does a random value of 1.31748659 US$ make except losing time and going straight into overoptimizing?
albert

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/13/2002 4:03:40 AM Poster : Bruno

There is such thing as over-optimizing when using GAs. Relentless optimizing (survival of the fittest) is what they are supposed to do. To that extent, they cannot be compared to neural nets.
However you are right in saying that when programming GAs, one can set the granularity of the search space. This affects computing speed and accuracy to an extent. What is more important I believe is the viability of the optimal solution over the neural out-of-sample period. In other developments, I found the second or third best solution is often more stable. This means that a post-processing statistical validation is more important for a better model.

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/15/2002 9:14:08 AM Poster : Steve Ward

You are of course referring to the number precision being used inside the GA. This can affect the precision of the solution, but the less precise solution should be found in about the same amount of time by all number precisions. In other words, all will get close to 3.23 in about the same amount of time. For a really precise answer, yes it will take longer to find, but who wants to find 3.2314567 when 3.23 is quite enough for financial problems? We already do not use high precision for that reason.

There is no doubt that much more research can be done to get faster GAs internally, but with regard to significantly speeding up optimization, I still believe it will only be done effectively with multiple processors. However, short of that I think the best suggestions are those people here have made relative to allowing users to control when the GA terminates, and possibly letting it look at out of sample results and choosing less than optimum results, as long as everyone fully comprehends the meaning of the fact that the out of sample data is then rendered in-sample.

Everyone should remember that the really unbearably slow optimization occurs when you use the indicators in the "Trading Strategy: ..." categories because they are recursive. But we have sped them up somewhat, and you'll see that in the next release. In the mean time, use some judgment in what you throw at the GA, both in terms of the number of bars and the number of parameters. Although they are much faster than other optimizers, they have limits.

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/17/2002 3:00:07 PM Poster : albertl

Hello,
The trouble however is that we, the user do not see from the outside when the
optimizer has reached the precision we know is sufficient .
And we cannot not set the precision either.
So , why not allow us to set the meshsize (the precision in a round about way) to what we know is realistic, instead of hoping that the optimizer will stop ...
As far as I can see the optimizer will spend some time even to optimize a boolean value to 1.356789 !
There are variables which take only a few discrete values, for ex 1 2 3 4
I use some ..
I cannot see the optimizer finding that out himself ,

Also, if the mesh size is increased, reducing the range of values over which the optimizer is allowed to run might then shorten the optimizing time .

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/17/2002 4:49:04 PM Poster : Steve Ward

The GA uses a slightly different technique for integers, and so it does not search values like 1.356789 when the discrete values needed are 1,2,3,4. The optimizer knows which parameters are integers and which are not. I definitely agree that reducing the range of values over which the optimizer is allowed to run may shorten the time somewhat; however we have already provided you with the capability to set those ranges yourself. Look for the little plus sign (+) to the left of your rule and click on it.

However, you really have to stop thinking of a GA in the traditional optimizer sense. I know that in traditional "exhaustive search" optimizers (like TradeStation's), it is a routine technique to raise the increment size to speed up the process. Reducing the range speeds it too, but much more so in a traditional optimizer than in a GA. Thats because the GA is varying all parameters at the same time, not one at a time, and it is searching many places in the space at the same time. GAs run much slower for easy problems (2 parameters) but they solve big problems in hours that would take other optimizer years. Looking for an increment size in a GA is like looking at the front of your new car to find the starter crank.

However you are right in saying that when programming GAs, one can set the granularity of the search space. This affects computing speed and accuracy to an extent. What is more important I believe is the viability of the optimal solution over the neural out-of-sample period. In other developments, I found the second or third best solution is often more stable. This means that a post-processing statistical validation is more important for a better model.

Hello,
I believe one should have the choice of optimizing in rough increments.
I know that the genetic optimizer is jumping around in the parameter spce, but It surely does this with certain increments.

These increments should be accessible to the user.
What sense does it make to have the space of 100 RSI points being divided into 10 000 steps with increments of 0.01
and have the NST running for days
and ending up with a nice OVER optimized model !
I want to set these increments myself, I would set them to 3 or 5 RSI points for example or to 3 or 5 pips in the trailing stop of a currency model.
!!!
Who knows anyway how these increments are set presently, do they make sense
really in all circumstances ?
A trailing stop of 0.01 dollar is way out of 0.01 pip in a currency which is not even quoted there

Re: wishlist/ ROUGH optimizer / SAVING 90% of time/ NO OVEROPTIMIZING

Date :7/17/2002 3:09:11 PM Poster : albertl

Hello ,
Can you tell us what precision you use?
Are you using the same precision for all variables?
Thanks

On 7/15/2002 9:14:08 AM Steve Ward wrote:
You are of course referring to the number precision being used inside the GA. This can affect the precision of the solution, but the less precise solution should be found in about the same amount of time by all number precisions. In other words, all will get close to 3.23 in about the same amount of time. For a really precise answer, yes it will take longer to find, but who wants to find 3.2314567 when 3.23 is quite enough for financial problems? We already do not use high precision for that reason.

There is no doubt that much more research can be done to get faster GAs internally, but with regard to significantly speeding up optimization, I still believe it will only be done effectively with multiple processors. However, short of that I think the best suggestions are those people here have made relative to allowing users to control when the GA terminates, and possibly letting it look at out of sample results and choosing less than optimum results, as long as everyone fully comprehends the meaning of the fact that the out of sample data is then rendered in-sample.

Everyone should remember that the really unbearably slow optimization occurs when you use the indicators in the "Trading Strategy: ..." categories because they are recursive. But we have sped them up somewhat, and you'll see that in the next release. In the mean time, use some judgment in what you throw at the GA, both in terms of the number of bars and the number of parameters. Although they are much faster than other optimizers, they have limits.

wishlist/ optimizer THE BLACK BOX should be OPENED

Date :7/11/2002 6:34:42 PM Poster : albertl

Hello,
This could be a major improvement and still super easy to implement as all the datas are anyway in the box.

While the optimizer is running, a nice table of all the parameters
should be visible !
I personally are willing to sacrifice a couple of minutes if I could observe the parameters during the runnoing optimization process.
This way I could also afterwards
choose from the hundreds of models in the list.

One could even feed a selection of these models in any of the NST s wizzards
or simply in the strategy wizzard and have them voted

albert

Wish List July 11 2002

Date :7/11/2002 7:34:23 PM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

Total Added: 43
Total Dropped: 5

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for mullple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.

Re: Wish List July 11 2002

Date :7/12/2002 9:48:17 AM Poster : Steve Cantley

Here's another idea that I think would be a good one. There are a couple of possible implementations that I'll discuss as well.

The GA Optimizer is pretty good at picking a global max or min, but not at giving us any idea of whether we've found a broad plateau or a narrow tower. I'm more comfortable trading something from the center of a plateau than a narrow peak that falls off quickly. The former seems to me something that will last better as market conditions change.

I'd like some soft of interface that would allow me to get a rough view of things like equity and drawdown, maybe Sharpe, etc. as a function of some of the parameters used in the model. It would probably have to be done two at a time just for the ability to visualize it.

It could be done from within the program, though that would probably be the more expensive way to do it. Possibly an easier method would be to do some form of intelligent log filing that would allow me to pull parameters and some of the results I'm interested in into a file I could import into Excel. Then I could graph things away to my heart's content.

I'll grant that this is more likely to bear the kinds of fruits I'm looking for if I'm not doing anything non-linear with the GA.

What do others think?

Best,
Steve

Re: Wish List July 11 2002/ the broad plateau in optimizing

Date :7/17/2002 2:33:08 PM Poster : albertl

Hello,
I do not give up regarding my criticism of the fine grid in the GA optimer
If the mesh is too fine you run much easier into overoptimizing and the plateau will be inexisting, it will be a peak ...

I strongly recommend to WARDsystems to allow using a wider meshsize
Why not limit the RSI number space to 10 20 50 80 90 (I exagerate a little here)
and force a wide plateau this way or at least increase the chances to get one...

Steve,

Some proposals probably in the User Inteface Category:

a) The ability to reload AIQ data. Currently it is necessary to exit NSDT (not simply reopen the chart in question) to reload the lates bars of AIQ data (not necessary with quote.com). For one chart this is not really a big deal but if you have a half dozen open at the same time say for production, then this becomes tedious.

b) The ability to set the default location of charts directory and also to increase the number of last opened/daved files in the File sub-menu to a value greater than 4. This waould allow for faster loading of charts.

Voting System of Nets

Date :7/12/2002 4:24:11 PM Poster : Dave Hubbard@Midwest

I am wondering what anyone's opinion would be on this idea. The object of having a voting system of different nets is to get a more diverse opinion from different classes of indicators (or predictors). If a volume based net and a momentum indicator based net agree, and they are both 65 percent correct, then the results of the voting based net would hopefully be at least better than 65 percent correct since the votes are coming from 2 classes of inputs that have a low correlation to each other.

My question is what do any of you think would be the result of having a voting system of nets with the same inputs but different outputs? An example would be to use the same inputs to predict the % change in close 3, 5, 10, and 20 days out (if they are all decent on their own or predict the %change in close over 3 days, the optimial buy, sell hold, for 3 days etc.....etc and use these nets in a voting system. Any thoughts as to whether this a good idea or foolhardy?

Dave

Re: Voting System of Nets

Date :7/15/2002 10:01:05 PM Poster : Steve Kratochvil

This is a great idea. Follow it further. It is very profitable. The Ward nets are extremely useful.

Steve

Suggestions for NS Professional

Date :7/12/2002 4:37:50 PM Poster : Dave Hubbard@Midwest

I have some ideas as to possible improvements to Neuroshell Trader Professional.

1. Allow the user to map parameters across buys and sells. For example, if the user were to optimize a trading strategy using a Simple Moving Average crossover, allow the user to specify that the parameters for Simple Moving Average must be the same for both the buys and the sells instead of having the moving average values be different for longs and shorts after the optimization. This may in some instances help to prevent overfitting and allow the user to develop more robust trading strategies. The same suggestion may apply to the threshold optimization in the Prediction Wizard.

2. Allow the user to integrate multpile time frame strategies into a prediction or strategy. One example would be to allow both a weekly and daily chart into the same chart so the user could develop a voting system that takes votes from both a weekly and daily prediction.

I would like to be a beta tester if you ever decide to put this into a future program!

Dave

Re: Suggestions for NS Professional

This may in some instances help to prevent overfitting and allow the user to develop more robust trading strategies. The same suggestion may apply to the threshold optimization in the Prediction Wizard.

2. Allow the user to integrate multpile time frame strategies into a prediction or strategy. One example would be to allow both a weekly and daily chart into the same chart so the user could develop a voting system that takes votes from both a weekly and daily prediction.

I would like to be a beta tester if you ever decide to put this into a future program!

Dave

Automated trading

Date :7/14/2002 1:47:24 PM Poster : Bruno

Hi,

Has anyone developed an automated trading system NSDT <-> DataX <-> InteractiveBrokers.com?

Regards
Bruno

Re: Automated trading

Currently I have an ATS between NSDT -> DataX <-> Datek. I have been looking at IB as a possible additional broker. They have an API that seems very straight forward making it a very easy option for me to add them on. I have also been looking at MyTrack.

Their API is indeed relatively easy to call from VB/VBA/VC++.
I do recommend it to all traders.

I am not a big fan of Microsoft's flavour of C++, so I wrote mine in VB6. They also offer VBA programming examples using ActiveX or DDE.

Trading from the beach is no longer a far-fetched idea... :)

Wish List July 15 2002

Date :7/15/2002 9:41:17 PM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

Total Added: 46
Total Dropped: 5

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. For nets build plot points by clicking on the Trading Strategy and marking all the desired trade locations known that the optimizer should try to achieve using the inputs. This feature could be called "Guided Optimization".
Added – June 22, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Abililty to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

44. Programmable Optimization objectives.
Added – July 15, 2002

46. Ability to load and unload data files, templates or DLL's without dropping and restarting NeuroShell.
Added – July 15, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

45. Graphical reports of the equity, Drawdown and other statistical progressions in the Trading Strategy detailed summary and analysis.
Added – July 15, 2002

47. Option to set total number of most recent files in File menu.
Added – July 15, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002
Drop is pending further investigation – July 15, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.

Hello,
The following wish is related to point 39:

It might have been mentioned also under the point "linking of charts", but here it is the way I would like to have it :
it should be possible to put e.g. buy signals from different "primary issues" from may be different charts(ex. Nasdaq signal, sp500 signal, usd index ..., etc) to vote in the final trading strategy for the "really" traded issue
I would call it "the primary issues voting comitee"
albert

Re: Wish List July 15 2002

Date :7/19/2002 4:43:07 PM Poster : albertl

Hello,
regarding performance wish item 30
if really I cannot convince WSG of the necessity of this point , I would like at least to see the parameters moving during the optimization (open the black box) and
furthermore I would like to have a normal "incremental" classical optimizer at my disposal, where I could get set increments I need and analyse the strategies fast and straightforward from a classical trading standpoint.

This could be seen as a "preprocessor- optimizer" for the GA optimizer

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

44. Programmable Optimization objectives.
Added – July 15, 2002

46. Ability to load and unload data files, templates or DLL's without dropping and restarting NeuroShell.
Added – July 15, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

45. Graphical reports of the equity, Drawdown and other statistical progressions in the Trading Strategy detailed summary and analysis.
Added – July 15, 2002

47. Option to set total number of most recent files in File menu.
Added – July 15, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002
Drop is pending further investigation – July 15, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.

Wish List July 15 2002 Ranking

Date :7/15/2002 9:56:28 PM Poster : Steve Kratochvil

Please submit a ranking of your 5 most important items from the Wish List July 15, 2002. Order them from First to Fifth with First being your first choice. Identify each item by number. Here are my selections as an example:

Wish List July 15, 2002 Ranking

First = 31
Second = 21
Third = 16
Fourth = 3
Fifth = 13

Thanks,

Steve

> I am looking at a new list at the end of the month. As for a cut off. I don't think that there should ever be one. I feel that if you want to have a voice or toss in your two cents that you should do it sooner than later. We are not dictating any schedule or time line to Ward Systems and when they decided to review the rankings from time to time you will be part of the solution or not. I feel that after the next release we will re-evaluate the list and NeuroShell for another round of items. I have decided to track all the rankings as well. If you want to change your selections, just post it. I am not concerned about knowing who is really who, we are a very honorable and trustworthy group, so your forum name will suffice to identify your selections.

Wish List July 15, 2002 Ranking

First = 31
Second = 5
Third = 33
Fourth = 43
Fifth = 42

Thanks for pulling all of this together, Steve.

Re: Wish List July 15 2002 Ranking

Date :7/18/2002 3:46:39 PM Poster : Michael Stigall

Do you have a cut-off date for the ranking process, and do you need any help in collecting or correlating the results?

Re: Wish List July 15 2002 Ranking

I am fairly new (about a month) and thus far a 'lurker" in the forum, but here are my top five

1st=44
2nd=35
3rd=26
4th=38
5th=13

On 7/15/2002 9:56:28 PM Steve Kratochvil wrote:

Re: Wish List July 15 2002 Ranking

Date :7/18/2002 4:31:24 PM Poster : Steve in California

My top five are:

1 = 44
2 = 1
3 = 13
4 = 35
5 = 28

Ever wonder why the results of optimization runs are very similar across different objective functions? See a spreadsheet I've forwarded to WSG to see why this is the case...And why I believe #44 should be the number 1 priority.

Having number 44 in the product would allow play with variations of the formula below.

Maximize ((Winners - Losers) * Average ((Net Profit per trade / # of Bars per Trade) / Open Drawdown per Trade))

See the spreadsheet to understand how this objective function formula is different than the current set of objective functions...

Hello from Luxembourg;
here my rankings:
A)— My wish "the primary issues voting comittee"
or respectively point 39.(Ability to create a chart with an indicator as the primary data series)
B)—point 15. Allow cut and paste of indicator formula

C)— point 30 "incremental" and transparent GA optimizer or at least a classical incremental and transparent one

D) —point 44. Programmable Optimization

E)—point 28. The ability to get overnight sessions from quote.com

How feed NSDT Pro from M3 from DTN?

Date :7/19/2002 10:49:38 AM Poster : Rolf

I got a free subsciption from M3(mrkstream) and a test-subscription on DTN.

How do I configure my NSDT Pro to connect?

Regards

Rolf

Re: How feed NSDT Pro from M3 from DTN?

Date :7/20/2002 12:58:11 PM Poster : fhealy

If your connection between the DTN receiver and your computer is via ethernet, the default DTN receiver box TCP/IP address is 10.100.116.110, so set your ethernet card with a specific address of 10.100.116.xxx, where xxx is something other than 110. Set the Subnet Mask to 255.255.255.0. Connect the receiver box to your computer with a crossover ethernet cable or connect with regular ethernet cables through a hub. When you first install the M3 tell it you are connecting via ethernet. When you start the M3, right click on the DTN feed line and make sure the M3 shows your ethernet card as the PC connection. You also have to set the DTN receiver box to transmit via ethernet port by using the F1 and F2 buttons on the front of the box (contact DTN for these instructions if necessary), its fairly intuitive. I have found a problem running the new version of M3 with NSDT, so I am still using the older version of M3 (Oct of 2001 version). Hope this helps.

Look at release news on this site for info on telling NeuroShell about M3. However, fhealy is correct - our standard release 3.5 does not talk to the latest M3. Once you get M3 running by itself with DTN, contact tech support and ask for a fix that will let you use the latest M3.

Tradestation

Date :7/19/2002 12:02:42 PM Poster : Eric L. Hoyle, CFA

I'm curious about how people feel about the new TradeStation brokerage/charting package. I notice that links between Neuroshell Trader and TradeStation, did not show up in the enhancements wish list. I know the current program is a step down from their 2000i product, but I was wondering more generally if people have abandoned them since changed focus.

I have an account with them, and will admit that they are not yet a full fledge institutional level tool, but I don't know how they compare with other online brokerage firms. However, the idea of a Trader link, and possible automatic execution is a little interesting...

Just curious what other people thought.

Re: Tradestation

Date :8/1/2002 2:09:34 PM Poster : Joe Decaro

Eric: I agree a link is needed to NST. I have both TS systems and I'm waiting the next release (7.0) with options. They are going to improve the execution system from what I have been told. I trade realtick and that is my std to reference. I'm moving to models on the e-mini and would really like to integrate TS->NST. Their are so many resources for TS it is really hard to ignore. An alternative is for Ward to link to metastock which has the same sort of features as TS but they say they are staying in the software biz. (this would make them a good candidate for reciprical arrangements) Their are somewhere converters from easylang to meta lang
Regards;
Joe

Wish list: Nested Nets

Date :7/21/2002 2:23:59 PM Poster : Mark Skiba

To approximate many trade strategies, cascading networks are required. For example, since major market moves have a large influence on individual stocks, using the output of a market index as an input for an individual stock predictor would be very useful. Also, many successful traders look at a stock from multiple time windows (intraday, daily, weekly) and it would be useful to take these multiple predictors into a final predictor net.

Ideally, you would be able to select a predictor signal of another chart as an indicator. Can this be done now with the DataX component using the PutData signal of one chart as the GetData for another chart?

Re: Wish list: Nested Nets

Date :7/22/2002 9:25:56 AM Poster : Steve Kratochvil

The cascading networks you are describing can already be achieved. The multiple time frames are already on the list (Item 21). Yes, you can use the DataX to do what you are asking. I am hopeful that the new release will give us some enhanced ability in this area. We will see what Ward Systems has in store for us.

Thanks,

Steve

Are there easier ways to achieve cascading networks in the current version than using the DataX interface? Is there a special external .CHT file Indicator I'm missing?

Thanks,
Steve

Re: Wish list: Nested Nets

Date :7/25/2002 8:18:38 AM Poster : Steve Ward

You don't even need the DataX to achieve cascading nets. Let's suppose you believe that predictions of index1 and index2 would be useful to predict DELL. Load a DELL chart as usual. Then insert "Other instrument data" to get index1 and index2 into the chart. Now insert trading strategies for index1 and index2. The key is that the output, the thing you are predicting, has to be chosen from the bottom of the dropdown list where it says "Other data/indicators". There you can choose index1 or 2 close, or percent change in index1 or 2, or really anything else related to index1 and 2. Don't select trading positions, and use an objective function that minimizes error. Train your nets. Now insert a third prediction for DELL, and use the out of sample nets for index1 and 2 as inputs. Simple.

If you further believe that index1 and 2 are useful for Apple, HP, IBM, and Gateway, just add those stocks to the chart. The nets will be automatically trained for the new stocks as well.

Those of you in my AI College class can refer to lesson 17 "Ensemble nets" for more on this and other types of ensemble nets.

Re: Wish list: Nested Nets

Date :7/25/2002 10:57:54 AM Poster : Steve Kratochvil

Please explain your cascading network idea or what you mean by cascading network. The only reason I ask is because DataX does nothing for you on this subject and a ".CHT" is the working file extension for your charts, not indicators.

Thanks,

Steve

On 7/25/2002 2:40:52 AM Mark Skiba wrote:
Are there easier ways to achieve cascading networks in the current version than using the DataX interface? Is there a special external .CHT file Indicator I'm missing?

Thanks,
Steve

On 7/22/2002 9:25:56 AM Steve Kratochvil wrote:
The cascading networks you are describing can already be achieved. The multiple time frames are already on the list (Item 21). Yes, you can use the DataX to do what you are asking. I am hopeful that the new release will give us some enhanced ability in this area. We will see what Ward Systems has in store for us.

Thanks,

Steve

On 7/21/2002 2:23:59 PM Mark Skiba wrote:
To approximate many trade strategies, cascading networks are required. For example, since major market moves have a large influence on individual stocks, using the output of a market index as an input for an individual stock predictor would be very useful. Also, many successful traders look at a stock from multiple time windows (intraday, daily, weekly) and it would be useful to take these multiple predictors into a final predictor net.

Ideally, you would be able to select a predictor signal of another chart as an indicator. Can this be done now with the DataX component using the PutData signal of one chart as the GetData for another chart?

Wish List

Date :7/23/2002 9:57:43 AM Poster : Dave Hubbard@Midwest

I have 4 picks for the wishlist. 1,3,21,and 35.

I have possible thing to add to the wishlist. Allow the Trading Strategy Wizard to access all of the same optimization options that the Prediction Wizard has. I would especially like to see the Trading Strategy Wizard allow for one, two, or three optimal walk forwards as opposed to just optimizing on a training set.

Dave

Re: Wish List

Date :7/23/2002 1:39:18 PM Poster : Steve Kratochvil

Your request is Item 13. I will included your comment detail.

Thanks,

Steve

Wish List July 15 2002 Ranking Report

Date :7/23/2002 1:34:19 PM Poster : Steve Kratochvil

I have sent up a very simple Ranking Report for your current opinions. It is a RankingReport.pdf file with the current totals and selections. I will post a new one with every new List. If I have missed you or incorrectly stated your selections please let me know. If you posted selections today then I will get them in when they post. Just a note: Item 44 has been dropped and added into item 13.

Thanks,

Steve

The file mentioned above can be downloaded using the following link:

Indicator Study: Adaptive Net Indicators - Predict

Date :7/24/2002 11:39:40 PM Poster : Steve Kratochvil

This is the next indictor that I am going to try and expound upon. If you have any request for things you would like explored or approaches that you would like tried or time frames used in my examples. You had better get in your two cents now.

Thanks,

Steve

Re: Indicator Study: Adaptive Net Indicators - Predict

Date :7/26/2002 8:00:03 PM Poster : Jacobs

I wish I had more to request than just,
please also use EOD data and not only intraday.

/Jacobs

Can trailing/profit target stops etc be optimised dynamically with ANI. I've had some success with signals primararily with entry ones but I cannot get much sucess if I insert my stops and / or profittargets into ANI. Is it realistic to expect the neural engine to optimise these sort of things? Ideally I'd use in a trading strategy only the ANI signals for entry and exit and not bother with any stops as they would be in the ANI.

Which one are you using? Classify, Predict or the Lags of these? Are you trying to build a Stop and Reverse or are you going to have exits? The reason I ask is this. If your doing Stop and Reverse with either type of net then exits are built in otherwise if you are trying to introduce a type of exit that you wish the nets to determine then build a second net that does that job. Nets need to be designed for a purpose. Then indicators may reference them or use their information for things like exits if the net's job is not to signal exits.

Thanks,

Steve

Re: Indicator Study: Adaptive Net Indicators - Predict

Date :8/5/2002 1:53:24 PM Poster : Maciej

I've had better results with Lag Classify ones. I understand that the exits ie <0 as opposed to >0 entries can be used as exits as well as entries. I'll take up your suggestion that I use separate nets for exits. The kind of question that I'm trying to answer is of the type "is it better to exit a futures contract at end of day or should one hold the trade open through to the next session". I've been caught a number of times by overnight news that's decimnated a small profit into a loss.

You can only answer that question. Here is how I see it. If you system is built to trade overnight then fix it. If your system is built to Day Trade then close all of you positions by EOD. Then in the light of the fact that you are getting killed on the over nights. Stop getting killed. You have the answer to your own questions.

I hope that helps,

Steve

Re: Indicator Study: Adaptive Net Indicators - Predict

Date :8/6/2002 11:09:20 AM Poster : Maciej

I only wish it were that straightforward. The issue is that sometimes its better to be in a trade overnight at other times its suicidical. To give you a recent example, my DJ system (Sep Futures) was short for most of yesterday (08/05/2002), great it made money - my problem yesterday was at EOD would it go down early today?, Being a coward I got out, it so happens that was a correct decision if you look at the todays's open. On other occasions it has been the wrong thing to do. So in an ideal world I'd like to have some sort of objective decision to be given on whether to stay in or get out. At its simplest - if more 50% overnight continuations were profitable historically I'd stay in if not then thge decision would be to get out. That's kind too simple - I'd like to predict a little better.

defining stop losses

Date :7/25/2002 11:06:54 AM Poster : David Onions

Hi, As a newcomer I would be grateful for some guidance. I have a net that is producing reasonable (67% successful) trades on walk forward tests using a few inputs and full optimisation (max winners versus losers) on the NT professional.

As to be expected some successful trades have an adverse period when there is a theoretical loss before closing in profit. I understand that the entry and exit signals have been optimised but can one refine the trading strategy by closing trades when the adverse position is greater than that seen with all (or a statistically defined majority) of successful trades. If so is there a way of gleaning this information from the walk forward tests?
Best wishes
David

Re: defining stop losses

Date :7/25/2002 3:55:38 PM Poster : Maxwell Craven

You might try one of the other optimization functions that minimize drawdown. Also maybe you can think of some indicator that you can use for a price level in the trailing stops. There are some indicators in the section of indicators called trading strategy system information that will no doubt be helpful (but Ward Systems has said they are much slower to opimize).

Getting some form of Wish List Item #13 (the old #44) in NST would help with what you're looking for.

IMO, there is no objective function that currently exists to assist with this issue of "Open Drawdown". For an objective function to be helpful, it would need to manipulate several different kinds of information (including OPEN drawdown). The current objective functions that manipulate OPEN (not CLOSED) drawdown don't manipulate other important trading strategy statistics (like Winners-Losers, etc.). In the last several days, I posted a small excel spreadsheet that showed my understanding of what information is being manipulated by current NST objective functions.

IMO, getting something about #13 would be great because it would allow you to develop your own objective functions in some way. On the other hand, IMO, it would be great too if all we got in the short term was a new objective function that combined several key trading strategy information elements. How about something like:

Maximize ((Winners - Losers) * Average ((Net Profit per trade / # of Bars per Trade) / Open Drawdown per Trade))

See the spreadsheet I posted in the last several days to understand how this is different than objective functions that currently exist.

Re: defining stop losses

Date :8/5/2002 9:18:37 AM Poster : Maxwell Craven

Further to my last post, the indicators I was thinking of are called "Position Drawdown" and "System Drawdown" and they are in the Trading Strategy System category.

Wish List July 31 2002

Date :7/31/2002 9:37:41 PM Poster : Steve Kratochvil

NeuroShell Day Trader improvements.

Total Added: 52
Total Dropped: 6

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. Programmable Optimization objectives. Ability to program the optimization objective with improved and expanded settings and/or out side indicators. This would provide for "Guided Optimization" by marking all the desired trade locations either manually, programmatically, or with an indicator, which the optimizer should try to achieve using the inputs. This ability to program the optimization objective also includes standardizing the optimization process features between the Trading Strategy Wizard and the Prediction Wizard. This is to mean that the any current additional features in either wizard that are found missing from the other wizard should be incorporated into the other. Example: Multiple walk forward tests for the Trading Strategy, sharing all optimization objectives between the two, Optional Long and Short side inputs for the Prediction Wizard.
Added – June 22, 2002
Changed – July 22, 2002
Changed – July 23, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

46. Ability to load and unload data files, templates or DLL's without dropping and restarting NeuroShell.
Added – July 15, 2002

48. Trading Calendar indicator to indicate short holiday schedules, season schedules, and any other schedule desired.
Added – July 22, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management -- allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

45. Graphical reports of the equity, Drawdown and other statistical progressions in the Trading Strategy detailed summary and analysis.
Added – July 15, 2002

47. Option to set total number of most recent files in File menu.
Added – July 15, 2002

49. Additional viewing selector. This would be a drop down next to the Frequency drop down selector. It would scale to the frequency and give you predefined zoom levels: Example 10 min, 20 min, 30 min, 1 hour, 2 hours, 3 hours, etc… 1 Day, 2 Days, 3 Days etc… rather than zoom.
Added – July 23, 2002

50. Additional option in the options screen to set the default, "Don't update chart while updating/backtesting" so that it is always checked.
Added – July 24, 2002

51. Replace Settings button. I need a button that will take the optimal settings and write them back into the parameter fields in all the indicators that were optimized so that I can turn off optimization and back test the optimized settings.
Added – July 24, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002
Drop is pending further investigation – July 15, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

52. Incorrect currency formatting of Profit value in the data grid of the Trading Summary window. It is missing the comma.
Added – July 26, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.
44 Dropped – July 22, 2002. Actually part of 13.

Re: Wish List July 31 2002

Date :8/8/2002 6:25:26 AM Poster : Maciej

Steve,

I propose another item to your wish list, perhaps under the bigs heading:

The ability to submit to Ward program failures. I've seen other software with this type of feature. For instance if an error is produced then an error llog is submitted quasi automatically to the software supplier.

NeuroShell Day Trader improvements.

Total Added: 52
Total Dropped: 6

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. Programmable Optimization objectives. Ability to program the optimization objective with improved and expanded settings and/or out side indicators. This would provide for "Guided Optimization" by marking all the desired trade locations either manually, programmatically, or with an indicator, which the optimizer should try to achieve using the inputs. This ability to program the optimization objective also includes standardizing the optimization process features between the Trading Strategy Wizard and the Prediction Wizard. This is to mean that the any current additional features in either wizard that are found missing from the other wizard should be incorporated into the other. Example: Multiple walk forward tests for the Trading Strategy, sharing all optimization objectives between the two, Optional Long and Short side inputs for the Prediction Wizard.
Added – June 22, 2002
Changed – July 22, 2002
Changed – July 23, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

46. Ability to load and unload data files, templates or DLL's without dropping and restarting NeuroShell.
Added – July 15, 2002

48. Trading Calendar indicator to indicate short holiday schedules, season schedules, and any other schedule desired.
Added – July 22, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines, The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management – allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

45. Graphical reports of the equity, Drawdown and other statistical progressions in the Trading Strategy detailed summary and analysis.
Added – July 15, 2002

47. Option to set total number of most recent files in File menu.
Added – July 15, 2002

49. Additional viewing selector. This would be a drop down next to the Frequency drop down selector. It would scale to the frequency and give you predefined zoom levels: Example 10 min, 20 min, 30 min, 1 hour, 2 hours, 3 hours, etc… 1 Day, 2 Days, 3 Days etc… rather than zoom.
Added – July 23, 2002

50. Additional option in the options screen to set the default, "Don't update chart while updating/backtesting" so that it is always checked.
Added – July 24, 2002

51. Replace Settings button. I need a button that will take the optimal settings and write them back into the parameter fields in all the indicators that were optimized so that I can turn off optimization and back test the optimized settings.
Added – July 24, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002
Drop is pending further investigation – July 15, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

52. Incorrect currency formatting of Profit value in the data grid of the Trading Summary window. It is missing the comma.
Added – July 26, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.
34. Dropped – July 1, 2002. Actually part of another feature.
44 Dropped – July 22, 2002. Actually part of 13.

Re: Wish List July 31 2002

Date :8/8/2002 12:49:08 PM Poster : Steve Kratochvil

Excellent recommendation. That feature has been part of some of the major products we have produced. We also installed an automatic version updating service that went the other way as well. Our automatic versioning system is far superior to the thing that Quote.com has now put in place for their continuumclient.dll. I will add it in and update the Heading for Performance to include System. Added item 53.

Thanks,

Steve

Re: Wish List July 31 2002

Date :8/15/2002 10:57:53 AM Poster : Maciej

Another couple of suggestions probably for the User Interface group:

a) Have the ability to save / name the set of variables that are being exported (under Tools). If one regularly exports the same data values it would be nice to have a pre-defined set.

b) The display of the trailing stop on the first bar of the entry - when entering on a market on open the price is the open of the bar so my trade is active, however the trailing stop line only appears after this bar. In a volatile market that first bar may even break the trailing stop.

Steve,

The following suggestion for consideration in the Features category:

What I want to do is to be able to control the frequency of resting that exists in Neuroshell (or in AT2/ANI) by say "if 2 consecutive losing trades then back test". Make the retesting frequency event driven rather than driven manually or in the case the add-ons the number of bars.

Regards,

NeuroShell Day Trader improvements.

Total Added: 52
Total Dropped: 6

Features:

1. Settings link feature that allows the parameters of different indicators to link to a single parameter entry and mirror the value. This needs to be supported in the optimizer as well. This might also be an extension of variable use and ability from a language.
Added – June 22, 2002

3. Allow the Trading strategy to optimized the synchronized logical common sense pattern of Long and Short trades for all trading styles. Option to force trading style rules to be used during optimization. Example: Close all trades at the end of the day.
Added – June 22, 2002
Changed – July 1, 2002

4. Allow the option for priority of trade to be set entry, exit or stops.
Added – June 22, 2002

5. Developing a BASIC / Trade Expression Language for NeuroShell.
Added – June 22, 2002

13. Programmable Optimization objectives. Ability to program the optimization objective with improved and expanded settings and/or out side indicators. This would provide for "Guided Optimization" by marking all the desired trade locations either manually, programmatically, or with an indicator, which the optimizer should try to achieve using the inputs. This ability to program the optimization objective also includes standardizing the optimization process features between the Trading Strategy Wizard and the Prediction Wizard. This is to mean that the any current additional features in either wizard that are found missing from the other wizard should be incorporated into the other. Example: Multiple walk forward tests for the Trading Strategy, sharing all optimization objectives between the two, Optional Long and Short side inputs for the Prediction Wizard.
Added – June 22, 2002
Changed – July 22, 2002
Changed – July 23, 2002

15. Allow cut and paste of indicator formula. This should include the results of an optimized indicator. Or allow it to be created as a new indicator.
Added – June 22, 2002

18. Allow stocks to overlay inside a chart and allow linking of charts
Added – June 22, 2002

21. Different Time frequency/compressions on one chart. Ability to select any time frequency/compression size desired within the time increment chosen. Example: Seconds, Minutes, Hours, Days, Weeks, Months.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 8, 2002

25. Share size rounding for block trading (10,100, 1000) in the prediction and trading strategy wizards.
Added – June 22, 2002

26. Save predictions/strategies for use in other charts.
Added – June 22, 2002

27. Open Interest values when using quote.com
Added – June 22, 2002

28. The ability to get overnight sessions from quote.com
Added – June 22, 2002

29. Give Alerts ability to be saved
Added – June 22, 2002

32. Special handling of futures contracts for month-to-month roll-on effect.
Added – June 24, 2002

37. Allow the Tick Data of the current bar to be used in a chart rather than only viewing it.
Added – July 6, 2002

38. Allow the option to select indicators or stocks in the chart to be excluded from any optimizations.
Added – July 6, 2002

39. Ability to create a chart with an indicator as the primary data series, replacing any symbol data series of a stock. The optimizations and trading strategies will be based on the indicator and results determined on the indicator, not the stock the indicator is based on.
Added – July 6, 2002

43. Optimization scheduler that allows optimizations to be scheduled to start (5:00pm or Now!) and limited by a time out setting that allows a maximum amount of time (5 mins) or a time dead line (11:56 pm) to stop the optimization process and return current results.
Added – July 11, 2002

46. Ability to load and unload data files, templates or DLL's without dropping and restarting NeuroShell.
Added – July 15, 2002

48. Trading Calendar indicator to indicate short holiday schedules, season schedules, and any other schedule desired.
Added – July 22, 2002

User Interface:

2. Produce the exact optimized parameter settings for a Re-named input in the final report. List/export a number of top genetic solutions. This would give a tree view print out of the formulas used and indicator combinations chosen.
Added – June 22, 2002
Changed – July 1, 2002
Changed – July 11, 2002

6. Graphing of the grid of prices and/or time across the chart in lite gray color.
Added – June 22, 2002

7. Arrange the Insert Existing Data/Calculations window popup in alphabetical order. Make this into a menu picker on the right as part of the Snapshot View that will allow you to just pick current indicators and drag them to the chart rather than Hide/Unhide Data… or allow you to drag indicators off the chart.
Added – June 22, 2002

8. Place the name of each indicator in the chart window associated with it and expand the top portion for more chart area.
Added – June 22, 2002

9. Allow the size of each chart area to be adjusted by dragging up or down.
Added – June 22, 2002

10. Allow more than 6 charts.
Added – June 22, 2002

12. Allow for more colors in the color bar.
Added – June 22, 2002

16. Improved graphics for the overlay of one indicator on top of another that would keep all indicator signals present and visible as the scale of the chart zoomed out to larger time frames in the window.
Added – June 22, 2002

20. Trend lines. The ability to draw straight trend lines on the screen with an indicator
Added – June 22, 2002

23. Ability to drag indicators between charts.
Added – June 22, 2002

24. A "Hide All" feature in the advanced area to allow fast hiding of indicator inputs when building a tpl.
Added – June 22, 2002

33. Trailing Stop performance information in the Detailed Analysis report.
Added – June 24, 2002

35. Formula based money management – allow definition of risk per position and in a portfolio and allow positions with variable shares/contracts to be opened. Allow positions to be added to or subtracted from algorithmically. Ability to bypass a trade if the risk parameters were unacceptable.
Added – July 1, 2002

36. Auto scaling of indicators to the display windows allowing indicators of different numerical size to be proportioned to each other on different ranges. This would display two or more numeric scales on the right side according to the color if the indicator.
Added – July 2, 2002

40. Cumulative (ALL INSTREMENTS) performance results of all issues being used, given in the Trading Strategy Results Summary along with the average which we already have.
Added – July 6, 2002

41. Ability to display and use different Trading Strategy parameter values for multiple stocks and/or futures in the same chart.
Added – July 8, 2002

42. Printouts should include the Date Time Stamp and File Name at printing.
Added – July 11, 2002

45. Graphical reports of the equity, Drawdown and other statistical progressions in the Trading Strategy detailed summary and analysis.
Added – July 15, 2002

47. Option to set total number of most recent files in File menu.
Added – July 15, 2002

49. Additional viewing selector. This would be a drop down next to the Frequency drop down selector. It would scale to the frequency and give you predefined zoom levels: Example 10 min, 20 min, 30 min, 1 hour, 2 hours, 3 hours, etc… 1 Day, 2 Days, 3 Days etc… rather than zoom.
Added – July 23, 2002

50. Additional option in the options screen to set the default, "Don't update chart while updating/backtesting" so that it is always checked.
Added – July 24, 2002

51. Replace Settings button. I need a button that will take the optimal settings and write them back into the parameter fields in all the indicators that were optimized so that I can turn off optimization and back test the optimized settings.
Added – July 24, 2002

Performance:

30. Set increment size for the value range being checked in the optimizer.
Added – June 22, 2002
Drop is pending further investigation – July 15, 2002

31. Multiple processor ability for improved speed and performance.
Added – June 22, 2002

Bugs:

11. Clean up the set focus event on the top tool bar so that clicking twice is not required.
Added – June 22, 2002

52. Incorrect currency formatting of Profit value in the data grid of the Trading Summary window. It is missing the comma.
Added – July 26, 2002

14. Dropped – July 1, 2002. Vague. It was one of mine.
17. Dropped – July 1, 2002. Vague. It was one of mine.
19. Dropped – June 22, 2002. Already in the trader. Look very closely.
22. Dropped – July 1, 2002. Actually part of another feature.

Accurate London Stock Exchange End of Day Data

Date :8/4/2002 5:03:23 PM Poster : Rob Lenzie

I'm a new Neuroshell Trader user.

Are there any Neuroshell Trader users out there doing end of day trading on the London Stock Exchange ?

If so where do you get your data from ? I'm having serious problems finding accurate data.

I've tried MicroCorp - lots of data errors, ShareScope - only 2 years of History and CSI's Unfair Advantage - their volume data comes from another planet.

Thanks

Rob lenzie

Rob,

www.investorease.com are a very good source for a reasonable £9.50+vat per month.
The FoxPro database allows LSE (and US) eod of data to be extracted in numerous formats including CSV which is a very good target as NST reads CSV files efficiently.

Hopefully you are proficient at using Excel (VBA) as a bit if coding can automate the process wholly, allowing you to extract an entire file of UK listed end of day stocks and indices for a particular date and then ask Excel to append the contents to NST CSV files.

Following that logic, you can obtain, end of day CSV files from yahoo at "http://chart.yahoo.com/d" for US stocks and most foreign indices free of charge, including the FTSE within reason (the Open is usually the previous days close). Although once again a bit of file manipulation is necessary, a VB solution could see you automatically download the CSV data and append your NST files at the press of a button.

Ergo.

I thought I would just add that Yahoo has started to provide the same data service for UK stocks as exists for US ones.

This means that you can down load for free most UK company data and load it into NST by means of a CSV file.

Ergo.

Date :8/7/2002 8:14:19 AM Poster : Riccardo Ronco - FBR Intl. London

There is a huge hole in yahoo data from Sept 10 up to Sept 17

these data, alas, are not reliable.
Italian stock prices were not converted in euros hence before 1/1/1999 you get data in italian liras.... cheap option but data are not reliable.

Rob,

For UK and Paris Stock Exchanges I use AIQ data for EOD. It also has the possibility of continous contracts in futures. I cannot vouch for the accuracy of the volume figures but its clear that the longer you wait before downloading the better the results. AIQ is read directly by NSDT. The data is generally of inferior quality to that of Quote.com (no UK data) so you have to repair the occasional wobbler. ESignal apparently has European data but I don't think it will be read by NSDT directly (you need to check with Ward). I've heard good things about Esignal but I'll only look at feeds that can be worked directly into my systems.
Hope that helps.

If you find anything better

Re: Accurate London Stock Exchange End of Day Data

Date :3/21/2003 2:52:49 AM Poster : Ergo Mann

End of day data can be sourced from several areas,

InvestorEase (iease.com) provide a FoxPro database and caters for splits etc., at a cost of £12 per month. It also has US stocks.

Whilst Yahoo.com has free data at (http://uk.table.finance.yahoo.com/d). US EOD can be sourced at http://chart.yahoo.com/d.

A word on reliability. Both tend to use last night's close as today's open for the FT-SE. This is incorrect, but this type of assumption reigns supreme. The importance of this is how NST uses the next period open as the buy/sell price.

Both give volume information, however, FT-SE 100 volume is a notorious black spot.

The Financial Times was the best source of volume information until about a year ago when it stopped publishing Friday figures in the Weekend edition.
Volume like the open tends to be a bit confused. The FT publish (Mon to Thur) the volume figure with and without the intra market activity.

InvestorEase is a good tools, it is updated during the evening post the close and is very cheap and reliable.

Ergo.

I've used AIQ for EOD of LSE and Paris Stocks but have found it tricky to use easily so much so that I dropped it. Among other things it has issues handling European holidays as well errors in the data.
I'm waiting for rel 4 of NSDT as that should have an ESignal feed. Hopefully that will have the facility for EOD as well as real time. Everybody tells me that ESignal is great and there is a EOD yearly subscription possible for circa $300.

Rules

Date :8/5/2002 9:48:34 PM Poster : Bill Carlson

Reviewing the rules that determine the strategy of different stocks, the strategy may indicate that only one rule determines the path to trade, buy or sell.

The stocks that indicate one rule on which a decision is made provides very meager returns and sometime a loss when commissions are considered. Whereas the stocks that require three or four rules prove to be more rewarding.

Is there some way to force a requirement of more than one rule in order for it to be considered as a trade.in trading strategy.

Re: Rules

Date :8/6/2002 11:20:22 AM Poster : Maciej

I use two ways of forcing the number of rules, one and probably the simplest one is on the trading strategy entry, the value by default is "all" and you can vary it from one to all. The other way which I use whenever I wish to have a finer control is simply to use the boolean such as and2 indicators to combine my rules.
Further to avoid suprises in real trading I use the features available in the trading strategy wizard (its also in the predict wizard) to set up costs / slippage etc. I tend to exaggerate the slippage as that helps give me more robust strategies. If a set of rules doesn't give a reasonable result using defaults I'd be very weary of trying to optimise it, in my view its a bit like multiplying a zero by any number.

Re: Rules

Date :8/6/2002 3:51:56 PM Poster : Bill Carlson

The Trading Strategy "ALL" is designated . Even so, the system chooses the rules that determine the direstion of trade. Sometimes one rule, other instances four rules are applied.
I do use "AND" in tying a Lag Close under Lag BB Low to Close Over BB Low. But using a Stochastic under and over a "20" or "80" to the above example seems to be cumberson and long, But perhaps is the only way to go.

Is an "IF THEN ELSE" statement different than an "AND" statement in the final result..

Thanks

Re: Rules

Date :8/7/2002 9:51:29 AM Poster : Maciej

There are a couple of "IfThen" indicators that you could use. Personally I prefer the abstraction of the "boolean" indicators of which there are more.
For the "ALL" substitute a number which corresponds to the minimum number of rules that you want to trigger a signal, ie 3 will require 3 rules, and also watch the optimization if you have selected "full" or "rule" optimisation then that seems to override your "ALL" you'll need no optimation or simply "parameters" .
You may find it easier to combine your several rules into one indicator then simply use the one indicator in your strategy.

Thanks. That's what I do now.

Formulas such as this have to be intergreted over and over again for each bar as it is evaluated by the GA optimization function. This is a very slow and inefficient process (I would bet that thousands of computer instructions get executed for each bar and GA cycle just to compute the sign function using this method. That's the reason I would like a built-in function (maybe a dozen instructions per bar). Its also hard to read and a pain to re-enter the formula over and over again.

I guess that I will just bite the bullet and write a DLL to do it.

Backtesting Time
Date :8/12/2002 8:59:41 AM Poster : Jimmy Raineri

I am aware of the issue with optimizing a trading strategy that includes indicators that use the trading strategy as input to the rules.

However, I am having what I'd consider a performance issue with simply backtesting (without optimization of any kind) these types of trading strategies.

For example, I have a strategy that uses "bars since filled". I am not trying to optimize this, I just want to backtest using my parameters. Using a minute based chart with only about 2 weeks being backtested takes about 30 minutes on my P4 1.8G machine.

Here is the strategy (in summary):

Long Entry (when 1 rule matches):

Time = XX:XX
Close > (Bars since filled * X)

Short Entry (when all rules match):

Close < (Bars since filled * X)

I don't see any obvious reason why this would take so long to backtest without any optimization. Any suggestions? Thanks!

Re: Backtesting Time
Date :8/12/2002 10:47:37 AM Poster : chris wong

in the for what its worth category, that took less than a second on my 1.8. sure you arent optimizing?

Re: Backtesting Time
Date :8/12/2002 10:57:18 AM Poster : Jimmy Raineri

How many trades did the backtest produce?

I assume it has something to do with the number of trades produced - my values for "X" cause it to produce about 30+ trades per day on average.

i got it up to about 15 seconds by changing your multiplier and getting 321 trades. maybe it does get real slow when you are up to 30 trades a day.

IMHO, any TS that uses system information (Bars Since Filled in your example) in its design is recursive, hence slow, even without genetic optimization.

Bruno - I don't understand - if there is nothing to "figure out" (optimize) what could be recursive?

Seems like the backtester would start at point "A", check the conditions, and move on to point "A+1". There is no need to go backwards at all from what I can see.

What am I missing?

Re: Backtesting Time

Date :8/13/2002 5:21:18 PM Poster : Webmaster@ward.net

Bruno is correct, the indicators are slow anyway - optimization just multiplies that time. If you are using the ones from Trading Strategy: Position Information, then try downloading release 3.7 on this site and using it. We had planned to speed them up in 4.0, but we moved up the timeframe. They aren't greatly faster - just somewhat faster.

Histrocial Sources of Put/Call ratio, Short Interest, etc

Date :8/14/2002 7:37:54 AM Poster : stephen

Does anyone know of a source were I can obtain other stock information like Put/Call ratio, short interest, etc. that I can download into Neuroshell? Is this included with some of the option price information? Basically, I am looking for other sources of data than just the stock price. - Stephen

Re: Histrocial Sources of Put/Call ratio, Short Interest, etc

Date :8/17/2002 4:36:58 AM Poster : Max Luppis

Stephen,
I am also looking for Put/Call ratio:
I found it in CBOE site but it looks like you can only pick one day at a time, then I found
www.maoxian.com (->memoranda -> historical)
that supplies Put/Call Ratio and Volatility in CSV format (perfect for loading in NST).
Please note that I don't know anything about this site, I found it by accident but I have verified some day with CBOE and they seem OK.
Regards
Max

Neuroshell 3.7 much faster optimizations

Date :8/14/2002 1:31:47 PM Poster : Mark Simpson (zawie)

Hi folks,

I'd just like to tell you, INSTALL 3.7! The documentation on it underplays the increase in optimisation speed.

I've just done some tests, with and without unloading dlls. The indicator
I used was "Neural Indicators", the ward2 net.

The optimization without unloading dll's came in at 42% faster than with.

Regards
Mark Simpson (zawie,adec)

API and Realtick

Date :8/17/2002 10:29:20 AM Poster : Nic Davirro

Has anyone used the API with Realtick? I'm not much of a programmer and could use a little help. I know just enough about VB and C++ to get in trouble. If you could help, that would be great. Also, I find data from quote.com to be a little slow. Is there a way to use the API to get realtime data from realtick (TAL).

Thanks,

Nic

Wish List: E-signal data

Date :8/18/2002 12:12:42 PM Poster : Marco Calzolari

I would suggest that the next DayTrader will be able to work also with E-signal. It could allow us European traders -at last!- to daytrade European securities. (The lack of a source including European real time data has refrained me from upgrading to the DayTrader up to now).
I would also be glad to feed the Daytrader with Bloomberg real time data, but may be this source is too expensive for many of us.

Re: Wish List: E-signal data

Date :8/18/2002 12:53:14 PM Poster : Webmaster@ward.net

We are indeed working on Esignal right now. In addition, we have found out that Quote.com is thinking about supporting world exchanges in the future, including forex!

On 8/18/2002 12:12:42 PM Marco Calzolari wrote:

Re: Wish List: E-signal data

Date :8/19/2002 11:51:15 AM Poster : Eric L. Hoyle, CFA

I would also be interested in seeing an interface to Bloomberg. It's an expensive service, but has almost everything, and if you have it, there's no reason to duplicate data feeds. According to the latest Ward newsletter (which everyone should get) they hope to have a "data pump", or a data feed API. The newsletter states:

"Now back to the power users. Our programmers promise there will be a data feed API so you guys with programming skills can write interfaces to your other favorite data feeds. We call it the Data Pump."

I know Bloomberg has API clinics. When the pump is out, we should talk to a programmer. Feel free to message me.

NS 3.7 and Quote.com

Date :8/19/2002 10:03:33 AM Poster : Matt R

Since updating NS Trader to 3.7, I have noticed an increasing number of disconnects from Quote.com. I was using version 3.4 of NS previously, I believe. I have not updated/changed anything with my Quote.com verions (ie updating QCharts or Continuum lib/dlls). Has anyone experienced this? Is this a known complication?

Thanks
Matt

Re: NS 3.7 and Quote.com

Date :9/26/2002 4:29:49 AM Poster : Maciej

I'm not sure that the issue is necessarily 3.7 but I get disconnects from time to time even though I'm running real-time. I've tried to get round the problem by running Qcharts on the same machine. The interesting phenomenon is that Qcharts seems not to disconnect whilst NSDT does; almost as if Quote.com has a policy of prioritising its own software at the expense of 3rd party software when the going gets tough in terms of load on quote.com's servers.

It would useful if Ward systems could give its opinion on this type of approach by quote.com and if my experiences are being borne out by other users (maybe its another reason why Ward is developing other feeds: I for one would have switched to ESignal if NSDT worked with it [They've been promoting special offers of users that switch from other feeds + I need the European data]).

Re: NS 3.7 and Quote.com

Date :9/26/2002 10:23:40 AM Poster : Webmaster@ward.net

Our feeling is that disconnects can be the particular server being used or the internet connection between them, and Qcharts could be using a different server at that time. We don't see any advantage in having Qcharts up at the same time; in fact it may be worse as two systems compete for the same resources. We suggest two things: (1) make sure you have auto reconnect turned on in the Trader and (2) use the "pinger" program before running the trader to get onto the best server (pinger is in the tip on this site called "Some relief from quote.com server outages.").

As readers of our newsletter know, we hope to have Esignal in release 4.0. It may have some problems too over the Internet, but at least users will have a choice.

MACD Math

Date :8/19/2002 5:46:28 PM Poster : Bill C

Attempting to normalize or converting MACD to a percent.

What is the best method or approach.

I was thinking of computing ratios of the 12 day MACD to a 12 day MACD with a lag of 12 days. The same for the 26 day portion of the MACD with a 26 day lag.

The other possiblity is the ratio of the current Close to each of the 12 and 26 day.

Perhaps neither of these. Does anyone use a similar approach?

Sept 2002 TASC Fuzzy Logic Article

Date :8/20/2002 4:31:50 AM Poster : Michael J. Begley

Yes, I've written a Market Profile add on for DataX. My evaluation of Market Profile was that it was a little use, so I gave up on that avenue, and went down a different one.

If you still want to use Market Profile, I suggest you check out the "Mobility Oscillator" in Mark Jurik's "Computerized Trading". You'll find it cleaner to code and it represents pretty much the same information, but in one indicator without all the fancy graphs.

(However I didn't find that indicator too useful either :-))

Be aware with a lot of these indicators (e.g. Market Profile), they build the indicator (it works), they license it to people. Then when it stops working, they
publish it to make one last bit of money from it. Call me a cynic, but's that's what I've found.

Check out Mark Jurik's indicators http://www.jurikres.com/, they're all good. The best moving average I've found that's free is Ehler's Zero Lag, but JMA just blows it out of the water. Also, CFB and VEL are good too. I use the lot.

Note: DDR and WAV they don't sell for neuroshell due to the number of outputs they produce (neuroshell only takes one). However, if you are crafty with your programming, you can get them to work for Neuroshell too with a tradeoff in speed, which unless you're using 1 min graphs shouldn't be too much of a problem. I've found both of these extremely useful with Neuroshell.

If you still want to go down the Market Profile route, shout and I've got code for
both that and Mobility Oscillator. For Market Profile, you'll need DataX.

Re: Market Profile of J. Peter Steidlmayer

Date :8/26/2002 4:09:38 PM Poster : Karl Bergerson

Mark,

Thanks for the feedback. It's good to have information
from someone who has already 'suffered' through doing
the research, and in your case, finding the indicator of
little value. That indeed may be my final result also,
but I'll look at your references and let you know what,
if anything, I come up with.

Sometimes, it is the individuals' use of the indicator
that makes it valuable, and perhaps it was Steidlmayer
that made it work (assuming it worked for him) vs
just selling classes.

Thank you,

Karl Bergerson

Wish List Suggestions

Date :8/27/2002 2:55:04 PM Poster : fhealy

Allow more that one entry into a position before an exit is required. This would permit several entry positions to be taken assuming the repatition of the entry rules prior to an exit or reversal taking place. Second, permit the program to allocate your trading capital to the first x stocks out of x+y stocks you are tracking in the chart, so, for example, you could have the program allocate $10,000 each to the first three stocks that signaled an entry out of your $30,000 of trading capital in a chart where 10 stocks were being followed under the same trading system. I my own case, either of these suggestions would mirror my own style of trading more closely than the way the program now operates.

Re: Wish List Suggestions

Wish list

Date :8/31/2002 1:07:22 AM Poster : Karl Bergerson

As a very new user, it is possible that my wish list has already been granted, but only due to my lack of knowledge that I ask this question.

Is it possible to have many of the default settings, e.g. trading costs, length of training period, put into some sort of file where the user could edit them and then have them be the defaults instead of having to reinput the values of choice each time one goes through the training process?

I think the other wish list would be a substantial user/training guide with many case studies that one could read at one's leisure while sipping coffee at Tully's. For me, reading help files rates pretty low on the desirability scale. The videos are good - the more the better, but a well written guide of the same quality as the program itself, would be an appropriate piece of the Ward System's bag of tricks. This would be a serious time consuming task, but I really believe such a reference guide should be available.

Thank you,

Karl Bergerson

RT Version?
Date :9/4/2002 8:30:19 PM Poster : bvandyke

Hi,

I'm an End of Day user currently, but considering going to the RT version. I'm just wondering what amount of Ram users of the RT version have found needed? I'm using only 128k now and EOD is fine. Also, i wonder how many bars of say 1 minute data of the QQQ for example....RT users might recommend needed to be loaded or analyzed for backtesting. Thank you in advance.

Bill

Re: RT Version?
Date :9/5/2002 10:46:52 AM Poster : Maxwell Craven

I have 256M and I would recommend more than 128 if you are going to use more than 2 months of 1 minute bars. However, I think 2 months is more than enough data for 1 minute bars. I figure that's about as many bars as 70 years of daily bars. I can't see why anyone needs more that that, and I usually do just fine with 1 month of minute bars.

Hi Bill,

I use 768MB personally, but you could probably get away with less. It
really depends how many charts and equities you want loaded at the same time and the total number of bars.

For training, I tend to train on a minimum of 1000 bars of any time
frame. If the output data I'm training against is scant, i.e. say it's
a classifying net, and I'm training against 1 and -1 and the 1 which inidicates "Buy" only happens 10 times in 1000 bars, then I'll increase the minimum number of bars to say 5000-10000, so the
net has something to learn off.

Regarding 1 min bars, there are some limitations. Mainly calculation time. If you have a simple net, no problems, but if you
have a lot of calculation going on, it might not be finished by the
next bar. I've found any calulation over about 10 seconds can cause
problems with getting past the UI etc. Add a delay from quote.com
and you start getting usability issues. Also 1min bars tend to
be noisy. On this basis, I tend to go to a minimum of 5 mins bars.
But it really does depend on what you're doing.

As explained previously by others here, the more the merrier. Memory especially but cpu upgrade as well, are in my opinion the easiest way to improve performance in day and RT versions. Use the task manger to see how much you're currently using. I have found the complexity of my indicators has a bearing as well.
As regards bars, I use as a starting point the recommendations by Ward of the number of daily bars and then use that value in the real-time, ie 5 years gives circa 1000 bars so I use as a starter 1000 1or 5 or 10 min minute bars Depending on the results I may increase or decrease the number of bars, for instance if I'm overfitting then one solution is to increase the number of bars.

Wish List: spread trading
Date :9/5/2002 3:45:04 PM Poster : Marco Calzolari

May be this wish does not interest everybody, but I work a lot with spread trading (long one stock and short another), also because it seems the only strategy that pays consistently in these days :-)
The work is done using Excel, or sometimes Metastock by creating a composite security (the ratio of the two stocks). Therefore at the moment I am able only to implement very basic strategies.
Being able to use Neuroshell Trader for this purpose would be fantastic!

Re: Wish List: spread trading
Date :9/6/2002 10:10:06 AM Poster : Eric L. Hoyle, CFA

I agree that the Trader could be a fantastic tool to do spread or pair trading. There's a pair trading chart you can download from this site, however, you are not able to harness the optimization or neural network features in the program. I believe there are a couple of ways that Ward could implement hedged trading strategies, either by being able to link charts or being able to create charts off of composite securities (indicators) as the primary data feed.

It is possible to create a composite security with the trader, export the data feed, save it in a file format that the Trader can read, and then open a Trader chart with that composite security as the primary issue. However, that is labor intensive and certainly not practical for real-time trading. It does produce some interesting results if you use the right securities.

Good luck and if you have any ideas let me know!

Optimize One Set of Rules for Both Long/Short Entries
Date :9/5/2002 6:25:41 PM Poster : Greg Kramer

I have been unable to find a way to allow NeuroShell Trader to optimize one rule for both Long and Short entries. E.g., I would like to be able to optimize the following strategy:

If (EMA(Close, 5) >= EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)
Else
Enter Short position (and Exit any Long position)

What I am forced to do is enter two rules:

Long Dialog:
If (EMA(Close, 5) >= EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)

Short Dialog:
If (EMA(Close, 5) < EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)

The problem is that the program optimizes the parameters of the two rules independently of each other resulting in strings of Buy/Short orders alternating on every other bar (i.e., Buy Short Buy Short Buy Short ...). This occurs when the Long Rule (using the optimized parameters) says BUY when the Short Rule says SELL. For the optimized set of parameters this might give a higher return, but there something is obviously wrong with such an inconsistent strategy.

I've might have missed something basic in the optimization setup of NeuroShell Trader, but is there anyway to optimize one set of rules for both long and short entries/exits?

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :9/6/2002 10:19:32 AM Poster : Webmaster@ward.net

There is no way in the current release to force the two rules to optimize using common parameters. However, your problem with alternating trades might not be because of that, but in any case you can probably correct it if you add more commissions. That provides a penalty for making frequent trades that don't make much money. Add commissions to decrease trading, subtract commissions to increase trading.

IMO linking identical indicators with the option to optimize with the same values would be the single biggest improvement to NSDT -- I've got some simple strategies that work fine in tradestation but they can't be used in NSDT because the buys & sells optimize differently, quite often yielding unpredictable results. Would love to transfer them so I could use NSDT's superior GA and backtesing on em.

Boy do I agree. Optimized strategies in NeuroShell are sub-optimal and extremely inconsistent compared to similar strategies optimized by the TradeStation's brute force optimization method. The problem is not with the NST's GA optimization method but with optimizing two strategies (buy/short) in parallel without taking into account what the other is doing.

A simple fix would be to allow a short rule to be constructed based upon the state of the Buy Rules.

E.g., If NOT "Buy Rules True" then "Short"

I don't have any problem with making the linking of values during optimization a high priority if lots of you want it. But I do have to disagree with the statement that the current method is sub-optimal or that it optimizes shorts without knowing what longs are doing and vice versa. All parts are always optimized in close coordination with all other parts. It builds totally coordinated strategies that are going to be more optimal than any optimization where linking occurs. If linking is better, the optimization will find equal values for the things you think should be linked.

The problem is, the optimizations we do now are not symmetric, and therefore they seem strange to humans used to symmetry. People just don't like to see things like a buy of RSI>55 and a sell of RSI<75. They like to see RSI>55 and RSI<55.

Again I am not arguing that we shouldn't do it; there are certainly benefits to having symmetry, even if symmetry will be sub-optimal, not the least of which is that people want it.

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :10/4/2002 5:14:46 AM Poster : Olli

Confidence is exactly the point here. We all know that optimizing may lead to curve fitting. If you give more degrees of freedom to your trading strategy, you are more likely to curve fit the strategy to the data. If you link the parameters, you simultanously reduce the degrees of freedom and the risk of curve fitting.

I like to optimize the trading strategies to find out a starting point for my parameters, and at the same time I try to minimize the number of optimizable parameters. Genetic algorithm may be fast (if you do not have to use exits or stops which need to know your entry, as the case often is), but I have no way of checking whether the optimization has found the most profitable (or whichever criteria you test for) parameters, which are on a nice plateau of profits compared to other adjacent parameter values, or do I have just an isolated profit peak surrounded with losses in the close neighbourhood. Now the only recourse is to walkforward or paper trade the strategy after testing - but there you are limited to only the set of data you have, which may or may not happen never ever again.

I would therefore like to advocate also for the inclusion of monte carlo simulation possibility. But as one cannot have everything, let us start with the linking feature.

Yes, please make this a high priority issue.

Olli

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :10/4/2002 4:47:48 PM Poster : Steve Ward

You are correct that linking reduces free parameters, and hence the chance of overfitting. Besides that it won't do anything to make sure you are on a "plateau" and not a peak. Plus there are many other ways to reduce free parameters. None the less, we are in favor of linking as I said before.

However, I'd like to discuss this plateau hypothesis, which I've heard many times before. Plateaus are in n dimensions, where n is the number of free variables in the optimization. For most people this is around 20 to 50, I suspect. You could have a whole cluster of solutions that keep you on the plateau when movement occurs in most of the directions, but not in all. You might have one dimension where you aren't even on the plateau unless one variable is quite specific. So the plateau isn't very wide in that dimension. I think you can see how hard it will be to get width in all dimensions.

Worse than that, being on a plateau vs a peak doesn't do anything to guarantee the solution works into the future very long, if at all. It only guarantees that close solutions work equally well on the data being optimized.

So the whole problem of making optimization better isn't as easy as it sounds. We have some thoughts here at WSG, but if anybody has any well thought out solutions I'd like to hear them, as long as they don't involve looking at the out-of-sample data during optimization. We know how to do that, and already do it for neural net optimizations (optimal walk-forwards). See the "Major modeling caution" tip on this site for more information on that technique.

Re: "People just don't like to see things like a buy of RSI>55 and a sell of RSI<75."

Its not that I don't like to see symmetry breaking rules developed by the program, its that the above rules leads to a alternating sequence of Buy .. Sell .. Buy .. Sell .. Buy .. Sell .. on each bar as long as RSI remains in the range between 55 and 75. Its this inconsistency that I would like to see eliminated.

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :10/7/2002 2:23:21 PM Poster : Steve Ward

If you are getting instant return to the opposite position after optimization, I encourage you to deal with that by increasing commissions. With small or no commissions, you can get the same thing with RSI threshold fixed, especially if you let the RSI window size vary. Commissions penalize frequent trading and make the GA more prudent.

There may be other ways to deal with that too, like clever use of crossover above and below indicators using the threshold as the second time series. This forum is a great place to discuss such ideas.

So I ran some tests which I'll summarize, again not to argue against linking, but to make sure there is no feeling that linking is going to be a panacea for some of the issues you face. I don't want people thinking any delay on providing linking is standing between you and riches.

I ran a reversal strategy on DELL from April 2001 to present, daily bars, no out of sample period. I used RSI> for buying and RSI< for selling, no commission, and threshold allowed to vary during optimization. I got 124% profit with 297 trades - way too many. Then I added $10 commissions both ways and got 23.5% profit with only 5 trades, probably too few for really active traders.

Then I tested fixed thresholds, e.g. RSI>50 for buying and RSI<50 to selling. In addition to 50, I used 10,20,...90, and the window size was fixed too. I got profits ranging from -42% to -1.2% (with commission), and some showed trades in and out every day, at least for periods. I did it again allowing window sizes to vary and got similar results, but with profits as high as about 9%.

Of course, there are a lot more similar tests you can run (and I hope you do), but to me the bottom line is that there are other forces at work that affect things you might want to blame on the inability to link. There are no silver bullets.

On 10/6/2002 10:21:23 AM Greg Kramer wrote:
Re: "People just don't like to see things like a buy of RSI>55 and a sell of RSI<75."

Its not that I don't like to see symmetry breaking rules developed by the program, its that the above rules leads to a alternating sequence of Buy .. Sell .. Buy .. Sell .. Buy .. Sell .. on each bar as long as RSI remains in the range between 55 and 75. Its this inconsistency that I would like to see eliminated.

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :9/8/2002 11:38:29 PM Poster : Steve Kratochvil

Greg, your issue is similar to the same problems that spread trading has when employed in NeuroShell. Here is a possible solution that I am sure you have tried and might be just a bit ugly.

Optimize all of your common indicators on the two sides of the trades. Then compare the Long and Short settings for all the indicators. Then set the limits on the optimization using the long and short values as the min and max limits. Another option is to take difference for the two cutting things down the middle and manually enter the values. In either case the results will tell you which one is better.

I hope this helps.

Steve

On 9/6/2002 10:19:32 AM Webmaster@ward.net wrote:
There is no way in the current release to force the two rules to optimize using common parameters. However, your problem with alternating trades might not be because of that, but in any case you can probably correct it if you add more commissions. That provides a penalty for making frequent trades that don't make much money. Add commissions to decrease trading, subtract commissions to increase trading.

On 9/5/2002 6:25:41 PM Greg Kramer wrote:
I have been unable to find a way to allow NeuroShell Trader to optimize one rule for both Long and Short entries. E.g., I would like to be able to optimize the following strategy:

If (EMA(Close, 5) >= EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)
Else
Enter Short position (and Exit any Long position)

What I am forced to do is enter two rules:

Long Dialog:
If (EMA(Close, 5) >= EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)

Short Dialog:
If (EMA(Close, 5) < EMA(Close(Close, 10)) then
Enter Long position (and Exit any Short position)

The problem is that the program optimizes the parameters of the two rules independently of each other resulting in strings of Buy/Short orders alternating on every other bar (i.e., Buy Short Buy Short Buy Short ...). This occurs when the Long Rule (using the optimized parameters) says BUY when the Short Rule says SELL. For the optimized set of parameters this might give a higher return, but there something is obviously wrong with such an inconsistent strategy.

I've might have missed something basic in the optimization setup of NeuroShell Trader, but is there anyway to optimize one set of rules for both long and short entries/exits?

Re: Optimize One Set of Rules for Both Long/Short Entries

Date :9/17/2002 4:17:38 AM Poster : Maciej

Greg,

Two methods exist:
a) add in artificial constraints (already suggested in the tips/techniques sections of this site) whereby you insist on a minimum trade of n bars, or you increase the commisions/slippage to discourage border line cases. Have a look at the indicators called Trading Strategy Position Info - this is not elegant but it might help.
b) ensure that your optimization does not optimize in a weird manner, ie the fast moving average remains faster the slower average - if you need help on this then shout.

Priorities

Date :9/16/2002 8:13:47 AM Poster : Steve Ward

The wish list seems pretty complete now and we thank Steve K for putting it together. Now I wonder if we need further debate about the priorities. Please don't believe because your wish is on the list that it will get done in the near future. There is tons of work here, and we have only so many programmer hours available. Does everyone generally agree with what is here now?

Re: Priorities

Date :9/16/2002 9:30:25 AM Poster : Steve K

imo the biggest improvemnt would be the creation of optimizable variables that could be used in multiple indicators and across the buy/sell/short/cover strategies. one obvious advantage(among many) would be the ability to optimize indicators on the same periods, for instance a MA that uses the SAME optimzed data on the buy & sell side

Variables could either be numeric or assigned to an indicator

I don't remember seeing this on the list

Steve

Re: Priorities

Date :9/17/2002 5:12:23 PM Poster : Eric L. Hoyle, CFA

The only thing that I think is missing from the list is the ability to use other data sources. However, Steve Ward has already said that will be available through the "Data Pump" (I'm guessing an add-on). Also, I've mentioned it before, but I'd also like to see an integration with the new (and I know "un-improved") Tradestation, but I understand that's a problem with Tradestation, not Ward.

In general, I would like to see more global/portfolio management improvements. For my own Pair trading, Improvement 39 under the "Features" section would help me trade and optimize relative value trading opportunities. I also think the ability to link charts, work with trading multiple securities as a portfolio instead as individual trades, and easily implement hedging strategies would be a great asset to the program. But I have not idea what the complexity of programming such abilities is. Good luck! Thanks for the ongoing improvements.

BTW: Did we ever count the votes? I've forgotten if we did.

-Eric

Wish List Ranking Report September 17

Date :9/17/2002 5:51:21 PM Poster : Steve Kratochvil

Here is the latest list of priority votes. I have sent it up as RankingReportSep17.zip.
Now that the list is holding shape, it should be farther emphasized that this is a collection of desired changes and has no control over the project development at Ward Systems.

If you have not voted or need to update your votes, then post 5 votes for items on the Wish List with the first vote being the most important.

Thanks,

Steve

Re: Wish List Ranking Report September 17

One more addition to wish list
Date :9/27/2002 6:10:29 AM Poster : Olli

I may be a little late,
but I have one wish to become implemented into trading strategies.

I trade forex, and there you either accrue interest on longs, or pay interest of shorts, most typically on daily basis, based on the size of position. This is something which cannot be currently taken into consideration in trading strategy costs.

Olli

Sniper Trading
Date :9/19/2002 11:26:21 AM Poster : Maciej

Has anyone implemented any of the ideas from George Angell's "Sniper Trading"? I'd be intrested if anyone has manged to implement the time/price rules that he defines.

Jurik DMX, DMXPlus, DMXMinus
Date :9/21/2002 3:36:54 PM Poster : zawie

This only applies to people that own Jurik JMA, if you don't own this add-on
for Neuroshell, then DMX, DMXPlus and DMXMinus won't work.

DMX is a free add-on to owners of Jurik JMA, but the template pack
that comes for neuroshell from Jurik doesn't contain the templates for DMX.

I've written an encapsulating DLL for this including templates to implement
DMX, DMXPlus and DMXMinus.

Anybody who wants this, shout.

Re: Jurik and other indicators
Date :9/26/2002 2:16:08 PM Poster : Mark Simpson, zawie

Actually, thinking about this, I've got loads of Jurik indicators, gimme a day or 2 and I'll get the help files written and the indicators uploaded.

Some others of interest that I'll include are:

* WAV and DDR. Jurikres say they don't work with Neuroshell.
I've got them to work. The reason they're not supposed to work is because they output multiple columns. I've got around this problem by calling the indicator multiple times. The interface is less than ideal because of this(after all they're not supposed to work), and it runs a little slower, but the usefulness of them far outweighs the extra hassle. It's no different (hassle wise) than say doing a wavelet transform in Neuroshell, and looking at 8 wavelets.

* AdaptiveVEL, AdaptiveRSX, AdaptiveJMA. Markets aren't linear, so it
doesn't make sense to model them with linear indicators. These indicators are
non-linear and work by feeding an additional Time Series (adaptiveLength) to the indicator. Recommended things to feed it would be "CFB(Jurik)", "CyclePeriod, Hilbert Transform (Ehler)", a "Volatility Calculation (my previously posted volatility indicators DLL)", or some other. These indicators can significantly reduce whipsawing.

* JMACD, JMACD2, Vel_Macd, RsxMacd, PGMacd - Various MACD functions based on Jurik stuff.

As you've probably guessed, I'm a Jurik Junky. If you haven't got Jurik, and you're serious about this, then buy it. It really does work as advertised. Sure it's not going to provide you with a trading system, but it does enable you to
build you're own, and get the edge. It's one of the few products out there that work like advertised. If you really don't want to buy it, then checkout TEMA and Ehler's Zero-Lag, they're free. Not as good as jurik, but certainly a step in the right direction.

I've also got some other indicators I'll post at a later date if there's interest.
TSI (Trend Strength Index), Hilbert Transform (InPhase, Quadrature, PhasorDistance, PhasorRotationDirection), Volatility Quality Index (VQI) and VQIOnBalance (similar idea to OBV), CPF_Pattern (candlestick combinatorial pattern detector), Balance of Power (BoP), CumlativeBoP.

I've coded most of the examples in TASC or Active Trader over the last few months and some past articles, but only where the article looks good and I haven't found it programmed elsewhere. So if you've seen something that peaks your interest, I may have coded it, just shout.

Also, I've built some Adaptive Resonance Theory Nets (ART) and I'm thinking of
building the Turing B-Type nets (adapted to deal with the problem inherent with
B-Types). Again if there's enough interest, I might release these too. However
I'd like to see more input to the forum before releasing these :-) I.E. If you have something and it's useful, send it on to the forum, most of us can benefit from the research others have done.

If you have something, but you're not a programmer, then post your ideas, if it's
interesting, I'll probably code it up and post it back.

Re: Jurik DMX, DMXPlus, DMXMinus

Date :10/31/2002 2:33:09 AM Poster : zawie

Sorry about the delay, I've been working pretty solidly recently on various other
projects.

It's "fit" for public consumption minus the help files, which I'm writing currently.
Then I'll put it into an install package and upload it (hopefully in the next few days,
work permitting).

Indicators contained will be:

Z CFB
Z JMA
Z RSX
Z VEL
Z DMX
Z DMX Minus
Z DMX Plus
Z WAV
Z DDR
Z Adaptive RSX
Z Adaptive VEL
Z Adaptive JMA
Z J Polarized Fractal Efficiency
Z Jurik MACD
Z Speedy MACD
Z RSX Delta
Z VEL Delta
Z VEL Delta Signal
Z Jurik BollingerBandHigh
Z Jurik BollingerBandLow

(The duplicated indicators JMA,RSX,VEL handle missing values as
normal neuroshell missing data, rather than 0, and will have help files, hence
putting those in too).

If there's any particular ones you want of that set now (and you don't mind not having a help file for it), just email me directly and I'll send you those through so
you can play with them.

Also, if there's a "Jurik'd" thing you find valuesble yourself and would like to
see in the package, just detail me the formula and name.

Also, none of the above indicators will work without already having the underlying
Jurik indicator (e.g. CFB/WAV) installed.

Prediction Wizard and prediction length

Date :9/23/2002 10:42:04 PM Poster : Gotwals

On the Prediction Wizard's first entry box the user specifies "how far into the future this indicator should be predicted:" Could someone describe the rationale for a particular entry? More specifically, I am investigating intraday trading of listed stocks by using 5-minute bars, and I would like to close out my position at the end of each day of trading.

So, I really have two questions. 1) Can intraday trading be done successfully with 5-minute bars, and 2) what would be a reasonable choice (and why) for the number of 5-min periods to predict into the future with the Change in Close indicator?

Re: Prediction Wizard and prediction length

Date :9/24/2002 8:13:54 AM Poster : Maxwell Craven

I usually am very successful with either 5 minute or 1 minute bars. The number to predict ahead seems to depend on how volatile the stock is and how many shares you are trading. Some futures work even better because they are more volatile. I usually do 5 to 60 minutes ahead. If you want to close out at the end of the day, you can put your prediction into a trading strategy with an time= exit rule added.

On 9/23/2002 10:42:04 PM Gotwals wrote:

How to trade with optimized indicators

Date :9/25/2002 5:34:46 PM Poster : gotwals

I have used the Prediction Wizard to optimize several indicators. I now want to intraday trade with this set of indicators. I presume the next step is to convert these indicators into rules so that they can be used in the Trading Strategy Wizard. Is this correct, and if so, how is this done?

Suppose I am using the Volume, Acceleration(Close,4), and Stoch%K(High,Low,Close,2) indicators. The Prediction Wizard seems to indicate that these will be successful in the particular issue I have used to optimize against. I have tried to check the Help files but can't seem to figure out what to do next.

Re: How to trade with optimized indicators

Date :9/26/2002 10:16:15 AM Poster : Maxwell Craven

Usually the prediction wizard gives you a trading strategy straight away right from your indicators. It starts giving signals as new bars come in. So you can use that, but I suppose you could also plug those indicators into a trading strategy. Then you might want to optimize them again there to get the rules right.

Trading Strategy Parameters

Date :9/26/2002 10:51:57 AM Poster : Bill Carlson

Why is it that when I have optimized a small number (10) of stocks, the system will indicate a number of trades up to my last download on Aug 2,2002, but whan I enter a larger number (30 Dow Ind) only one stock will indicate opportunities in the year 2002.and the remainder will cut off recognition on June 1, 2001 or the last week of May 2001.

The date parameters were the same in both instances.

Bill

Re: Trading Strategy Parameters

Date :9/26/2002 1:32:12 PM Poster : Texas Bubba

Hey, that sound suspicisly like somthing that bit my a.. somtime back. Turns out I didnt download the new data and the program was leaving off where the history cd left off. Lookat that history cd and see if the date on the lable is June or May 2001. May real sure you really did download. Then check on your format dates.

Wanna save comissions?

Date :9/26/2002 2:28:55 PM Poster : Mark Simpson, zawie

Hi,

Just to let anyone know who doesn't already and who likes to not pay for
their brokers retirement. :-)

Check out: http://www.interactivebrokers.com/

They offer cheap, cheap commissions, 1cent per share on US equities, and
$1 per contract for US options. I've opened up an account with them recently and I'm very impressed so far. They'll also do foreign accounts for Canadian, UK and a few other countries with minimal setup trouble.

I was suspicious at first, as I couldn't figure out how I could be given such an
unbelievable deal. They cut the costs by having everything automated, documents sent via email. With the volume they generate they get paid for it from the floor, which is why they're so cheap.

If there is enough interest in automated trading and enough people have an IB
account, I'll be building a Neuroshell to Interactive Brokers automated trading interface which I will provide to the forum at a later date.

NYSE executions depend on the specialist, really. But the spreads on active stocks are often .01x.01, and lifting the offer or whacking the bid will get your shares quickly (I've never waited more than 3 seconds..)

I doubt you could get faster executions anywhere as a retail trader.

The reason I asked is because of my experience with CyberTrader. Starting August 16, CyberTrader listed trades were processed through SCHWB rather than N, and the execution times became quite lengthy. I complained several times, but it didn't seem to help. Currently I pay about $16 per NYSE trade, so it looks like IB is attractive for both execution times and execution fees. However, when I lose my communications link and want to close out in a hurry, CyberTrader always answers the phone promptly.

It sounds like they're doing a good job of skinning their customers..

@IB, you can be filled against TMBR (Timberhill? LLP, the prop arm of IB). But this will always be faster than the specialist (i.e. they fill you directly if they can give you as good or better pricing than the specialist).

Of course, when I'm filled against TMBR instead of the specialist, it usually means I'm on the wrong side of the trade. ;)

Re: Multiple Time Frames, lags of nn output.

Date :12/22/2002 2:15:39 PM Poster : j ferguson

Mark,

I'm attempting to do the same thing (using datax) but it's slow going (I'm still building my debug toolset, etc, and learning c# at the same time..)

Basic strategy: I have a couple of nets that work pretty well through different intraday time frames (usually 1h-30min-15min, or 10m-5m-1m, around 60% correct-- tradeable but horrible commissions cost). The idea is to use the one timeframe's nets (or indicators, like tema9 > ma(13)) as a filter on shorter-timeframe trades.

Another thing I'm playing with: asymmetrical lagging of nn signals. I only have enough sample trades to be on the bare edge of statistical validity (30ish), but nearest neighbors are ok, and average return for the basket of equities nearly doubles.. I've also brought the out-of-sample data in-sample, but in the smallest way possible.. I'll let it walk forward for another 30-50 trades and let the forum know how it turns out.

Almost any net I build is 'early' on it's signals, and flip-flops. asymmetrical lags of the signal seem to limit this behavior . I'm manually searching through a small space (1-5, and 1-3 seems to be the reliable range for robust results).

Lagging the NN signals didn't walk forward very well, but the NN itself proved to be more robust than I thought. Simple stuff-- 4 lags of tema9(close,close,close), but it seems to work (70% hit rate, 100% annualized, etc)

regards

Definately along the right tracks, but I recommend try it with at least 2 maybe 3 indicators.

What I've found is that with the normal Neural Network, if you give it one input, all it can learn is the relationship between the current value and the output.

If I gave you a chart, and said to you, the Moving Average is "93.8", where is the price going next. You would say to me: "What are the values before, so I can at least see if it's going up/down etc.". In my research I've found that Neural Nets aren't too different. I.E. To have a chance of learning a pattern, they must be presented with the pattern. One way to do this is TDNN (multiple lags of the same input). I.E. Typically I lag by 0,1,2,3,4 periods (but you can also play around with the amount you lag by).

Another way, is to precprocess your data in such a fashion that you' re detecting the patterns for the net first. For instance, using some of the candle pattern selections from Neuroshell is one way of preprocessing the data going into the net. A TDNN of an indicator like this wouldn't provide much benefit (unless looking for a consecutive number of pattern matches).

I've found in my research, that if you take a good indicator, and then TDNN it, then combine it with another 1 or 2 good indicators (TDNN'd again). You'll find the results considerably better than without. When you TDNN the first indicator, it's as if the net locks down and become more stable and consistent in results.

NN's are only miracle workers when the relationship between inputs and output are well defined, with stock data this isn't often the case. However by preprocessing you data to highlight the features you're looking for, and then designing a net to detect these, the model will generally function better.

You can implement TDNN by lagging inputs in prediction wizard, however, Adaptive Net Indicators add-on also does this more seamlessly with it's LagPredict and other indicators.

Also, bear in mind when you TDNN nets, you're also adding more Degrees of freedom (DOF) to the model, which is a bad thing. So you may want to look at reducing DOF by using DDR from Jurik Research (there's a ZJurik add-on on this forum that will allow you to use DDR with Neuroshell Trader).

Mark Simpson

Re: Multiple Time Frames, lags of nn output.

Date :1/13/2003 9:41:37 AM Poster : Steve in California

Another approach to setting the "context" of an indicator value is to provide the slope of the line formed by indicator values, (i.e., use the "Linear Time Regression: Coefficient of Regression (Slope)" indicator).

I have not done rigorous testing of these two approaches to setting the "context" of an indicator value (i.e., the "slope" approach noted above and the lagged value approach described below) to determine if one is better than the other or perhaps better in some contexts. It would be a good thing to know which worked better. Anyone done rigorous testing of this willing to share?

Thanks for your comments..

I don't think I was necessarily clear enough (still getting the hang of the jargon)..

What's working for me right now is a TDNN of Steve K's tema9. TDNN's built with close work too, but not nearly as well, (and I'm pondering the purchase of the jurik indicators to get even smoother inputs). I'm using this on hourly bars, and the results have been suprising (without any optimization).

The idea of building a 'panel of expert TDNN's ' hadn't occured to me yet-- that's a great idea.

I don't understand your degrees of freedom comment, though. In the case of my simplest model, I'm only removing (max) fifteen degrees of freedom (current input and four lags thereof) out of a training set of >1000 bars. To me (even with 3 separate tdnn's) it seems like that is fewer degrees of freedom lost than even the simplest of moving average systems.

Right now I'm focused on building the simplest nets possible-- I was stuck in 'overfit purgatory' for way too long- starting over this way has led to considerable improvement.

So now the question is, what happens when I find 5 non-correlated inputs w/ ddr, build tdnn's out of all of them, and then a master-net with each of the tdnn's as inputs? Hmmmm.

Thanks for your comments! BTW, did you ever do any work on a data-X -> IB TWS interface?

Regards,

J Ferguson

I"m sold on Jurik (as you've probably gathered :-)). It blows TEMA out of the water. Don't get me wrong, TEMA is good (and also Ehlers Zero-Lag (better than TEMA, not as good as Jurik)). If I was to put Jurik, Ehlers, TEMA, EMA and SMA on a scale of 1-10, I'd say: SMA=1, EMA=3, TEMA=6, Ehlers=8, Jurik=10.

However, I'd suggest trying at least 2 different lengths of whatever moving average you decide to use. Also, try some other indicators too, i.e. not just moving average type indicators.

>I don't understand your degrees of freedom comment, though. In the case of my simplest model, I'm only removing (max) fifteen degrees of freedom (current input and four lags thereof) out of a training set of 1000 bars. To me (even with 3 separate tdnn's) it seems like that is fewer degrees of freedom lost than even the simplest of moving average systems.

The problem is, that the more inputs you have to your model, the higher DOF, hence the less faith you should have in the model. I.E. If you have 2 models, backtesting is the same, but one has 15 inputs and one has 5. You'd pick the one with 5, because the inputs are more accurately specified and define the output better.

The problem with TDNN is that you're multiplying your number of indicators by the number of lags, hence you're using considerably more inputs to the net. The solutions is a) Ignore it or b) Try to remove highly correlated data within the inputs. I.E. You take 15 inputs, feed it to a decorrelator, and out pops 3 significant inputs. You feed those to the net.

>So now the question is, what happens when I find 5 non-correlated inputs w/ ddr, build tdnn's out of all of them, and then a master-net with each of the tdnn's as inputs? Hmmmm.

I'll slip another thing into the equation, use 2 more timeframes too.
:-)

>Thanks for your comments! BTW, did you ever do any work on a data->X IB TWS interface?

I have it on the list of things to do. I've been waiting for NST 4.0 alpha to evaluate the new data pump to see if it would work for this. The alpha has recently been distributed, so I'll let you know soon.

Re: Multiple Time Frames, lags of nn output.

Date :1/15/2003 9:41:47 AM Poster : Steve in California

One of the reasons I've been using Linear Regression Slope as a means of providing the "context" of an indicator value to the nn rather than multiple lags has to do with precisely this issue of keeping the degress of freedom down. As I said before, however, I haven't done rigorous testing to determine the value of the two approaches.

On 1/14/2003 5:39:17 PM zawie wrote:
>>;What's working for me right now is a TDNN of Steve K's tema9. TDNN's built with close work too, but not nearly as well, (and I'm pondering the purchase of the jurik indicators to get even smoother inputs). I'm using this on hourly bars, and the results have been suprising (without any optimization).

I"m sold on Jurik (as you've probably gathered :-)). It blows TEMA out of the water. Don't get me wrong, TEMA is good (and also Ehlers Zero-Lag (better than TEMA, not as good as Jurik)). If I was to put Jurik, Ehlers, TEMA, EMA and SMA on a scale of 1-10, I'd say: SMA=1, EMA=3, TEMA=6, Ehlers=8, Jurik=10.

However, I'd suggest trying at least 2 different lengths of whatever moving average you decide to use. Also, try some other indicators too, i.e. not just moving average type indicators.

>I don't understand your degrees of freedom comment, though. In the case of my simplest model, I'm only removing (max) fifteen degrees of freedom (current input and four lags thereof) out of a training set of 1000 bars. To me (even with 3 separate tdnn's) it seems like that is fewer degrees of freedom lost than even the simplest of moving average systems.

The problem is, that the more inputs you have to your model, the higher DOF, hence the less faith you should have in the model. I.E. If you have 2 models, backtesting is the same, but one has 15 inputs and one has 5. You'd pick the one with 5, because the inputs are more accurately specified and define the output better.

The problem with TDNN is that you're multiplying your number of indicators by the number of lags, hence you're using considerably more inputs to the net. The solutions is a) Ignore it or b) Try to remove highly correlated data within the inputs. I.E. You take 15 inputs, feed it to a decorrelator, and out pops 3 significant inputs. You feed those to the net.

>So now the question is, what happens when I find 5 non-correlated inputs w/ ddr, build tdnn's out of all of them, and then a master-net with each of the tdnn's as inputs?

Hmmmm. I'll slip another thing into the equation, use 2 more timeframes too.
:-)

>Thanks for your comments! BTW, did you ever do any work on a data->X IB TWS interface?

I have it on the list of things to do. I've been waiting for NST 4.0 alpha to evaluate the new data pump to see if it would work for this. The alpha has recently been distributed, so I'll let you know soon.

>I'll slip another thing into the equation, use 2 more timeframes too.
:-)

I'm still getting my c# base classes finished (finally got the datax dll working), but I should be able to play with that soon. Questions: when using MTF, aren't you using wayyyyy more degrees of freedom than a single-timeframe? How much do you worry about it? Have your results improved, either quantitatively or qualitatively?

Regards,

J Ferguson

A degree of freedom is frequently associated with each free parameter in a simulated trade history. The central limit theorem requires you to have sufficient data to validate your system. Most statisticians would demand 30 decisions for each degree of freedom (DOF) in your solution. Therefore, you must not only take into account the DOF associated with each indicator you may be using, but you also need to account for each rule in your strategy. I think you may be surprised as to how many DOF even simple systems have. In this regard, it is most important that you have a sufficient number of buy/sell trading decisions for the dataset you are validating your solution with. Since there cannot be an exact solution to your problem, you can only emulate a solution while keeping DOF, total trades and trade frequency under control.

On 1/13/2003 12:41:09 PM J Ferguson wrote:
Thanks for your comments..

I don't think I was necessarily clear enough (still getting the hang of the jargon)..

What's working for me right now is a TDNN of Steve K's tema9. TDNN's built with close work too, but not nearly as well, (and I'm pondering the purchase of the jurik indicators to get even smoother inputs). I'm using this on hourly bars, and the results have been suprising (without any optimization).

The idea of building a 'panel of expert TDNN's ' hadn't occured to me yet-- that's a great idea.

I don't understand your degrees of freedom comment, though. In the case of my simplest model, I'm only removing (max) fifteen degrees of freedom (current input and four lags thereof) out of a training set of >1000 bars. To me (even with 3 separate tdnn's) it seems like that is fewer degrees of freedom lost than even the simplest of moving average systems.

Right now I'm focused on building the simplest nets possible-- I was stuck in 'overfit purgatory' for way too long- starting over this way has led to considerable improvement.

So now the question is, what happens when I find 5 non-correlated inputs w/ ddr, build tdnn's out of all of them, and then a master-net with each of the tdnn's as inputs? Hmmmm.

Thanks for your comments! BTW, did you ever do any work on a data-X -> IB TWS interface?

Regards,

J Ferguson

On 1/12/2003 8:14:40 PM zawie wrote:
Definately along the right tracks, but I recommend try it with at least 2 maybe 3 indicators.

What I've found is that with the normal Neural Network, if you give it one input, all it can learn is the relationship between the current value and the output.

If I gave you a chart, and said to you, the Moving Average is "93.8", where is the price going next. You would say to me: "What are the values before, so I can at least see if it's going up/down etc.". In my research I've found that Neural Nets aren't too different. I.E. To have a chance of learning a pattern, they must be presented with the pattern. One way to do this is TDNN (multiple lags of the same input). I.E. Typically I lag by 0,1,2,3,4 periods (but you can also play around with the amount you lag by).

Another way, is to preprocess your data in such a fashion that you' re detecting the patterns for the net first. For instance, using some of the candle pattern selections from Neuroshell is one way of preprocessing the data going into the net. A TDNN of an indicator like this wouldn't provide much benefit (unless looking for a consecutive number of pattern matches).

I've found in my research, that if you take a good indicator, and then TDNN it, then combine it with another 1 or 2 good indicators (TDNN'd again). You'll find the results considerably better than without. When you TDNN the first indicator, it's as if the net locks down and become more stable and consistent in results.

NN's are only miracle workers when the relationship between inputs and output are well defined, with stock data this isn't often the case. However by preprocessing you data to highlight the features you're looking for, and then designing a net to detect these, the model will generally function better.

You can implement TDNN by lagging inputs in prediction wizard, however, Adaptive Net Indicators add-on also does this more seamlessly with it's LagPredict and other indicators.

Also, bear in mind when you TDNN nets, you're also adding more Degrees of freedom (DOF) to the model, which is a bad thing. So you may want to look at reducing DOF by using DDR from Jurik Research (there's a ZJurik add-on on this forum that will allow you to use DDR with Neuroshell Trader).

Trading Strategy Parameters

Date :9/28/2002 4:02:31 PM Poster : Bill Carlson

In a pevious post I had thought the problem was in the date selections in Trading Strategy Parameters.

I had been attempting optimization up to Aug, 2, 2002, now with the new download
to Sept. 28.2002, the chart is only recognizing data to the end of June 1 2001.

How do I get the chart to at least recogonize the new data, then maybe I can get current opportunities.

Bill

You should probably send your chart with the downloaded data to support@wardsystems.com. Then we can see what is going on.

Thank you for the offer, But I think Ihave found the cause.

I did not realize that I had to re-format the chart after every dowload.

Am running a new backtest and will re-format after the next dowload.

WANTED - LIST. Long

Date :9/29/2002 3:12:57 AM Poster : Rudolf J. Skubella

A good number of improvements are needed.
The following list does not have an order of importance. All of them are important and truly will make the NeuroTrader a 600 SEL Mercedes, which finally would be fit to do a lot more of serious moneymaking research.
After all, excellent trading systems are possible, however they nearly always do require lots of work and the better the available tool box is, the easier it is to indulge in the immense pleasure of working with the NeuroShell Trader.

1.)
In addition to the 'Stop Optimization' and 'Abort Training' buttons a PAUSE button is needed to make long hours of testing more manageable and be able to perform other everyday tasks like letter writing etc., when necessary.
It must be possible to interrupt these activities and continue with optimization/ training at a later point in time, exactly at the formerly reached stage where I left off and WITHOUT result accumulation. Currently, the only choice "Start optimizing using the last optimal settings" starts a FURTHER, sort of ACCUMULATED optimization based on the formerly interrupted stage of optimization and therefore does get different results than one initial optimization in one go would have produced.

2.)
The software must allow to perform MONTE CARLO SIMULATIONS.
This very powerful and rather unique method is absolutely needed as an important addition to the usual walk-forward testing and out-of-sample testing !
A trading system that 'survives' a Monte Carlo Simulation, usually tends to be much more realistic and robust in actual trading. Whereas usual walk-forward testing has quite a number of possibilities to cheat yourself into believing how good a system is, when it actually is not more than money loosing trash.

3.)
One large VIRTUAL FILE CABINET /REGISTRY ARCHIVE must be built into the software in which each and every bit of each and every test/analysis that was ever performed can be accurately stored, archived, registered and will be accessible as one huge history LIBRARY that can be sorted, linked, scanned, cross referenced etc. A simple 'Print to Clipboard, File', as currently, is by far not sufficient.
Each and every catalogue entry in that library then also should have a HYPERLINK that pops up the CHART, including subcharts of predictions, trading strategy AND (see below) # 8, that belong to that catalogue entry !
Systematic working and learning from one's own work absolutely requires superior management of test results.
Entire test libraries could then even be sent by email to other users to perform further research in specific areas !
Much too much time is lost and too many inefficiencies are created (not just at important federal agencies that everybody knows...), just because the all important solution of a superior management system of acquired knowledge and information is not in place and instead the same research is done over and over again and thousands of results are stored in 'cellars' without anybody being able to find anything.

4.)
The following MEASUREMENTS, NUMBERS, tests must be computed and be displayed in the relevant results/statistics pages:
a) ANNUALIZED RISK-REWARD RATIO as such and compared to buy-and-hold
b) STUDENT t-TEST that would be able to compare and display the SIGNIFICANCE of the results of at least TWO trading systems
c) TIME TO RECOVERY: how long does it take the system to have large drawdowns/ the largest drawdown recovered
d) TIME IN THE MARKET: total bars in market compared to the total of tested/available bars

5.)
Each Input in the PREDICTION WINDOW should be displaying a NUMBER, the same number one finds in the test result window when looking up the 'Input Contribution' of every input after a test has finished. This makes it much easier to find which input is which in the Prediction Window, if I want to delete the zero contribution inputs, but have say 50 inputs in the box that stare at me, without a number.

6.)
Each CHART should display in its headline all particulars of the FULL PATH DESCRIPTION and not just its name 'Test.cht'. Methodical working often will require, particularly in absence of the above # 3.), that many subdirectories are available with sometimes the same chart name. Which then can not be clearly identified on the screen, next to each other, and unwanted modifications easily are made and stored in the wrong chart, strategy.

7.)
It must be possible to STORE EACH and every bit of a TRADING STRATEGY and separately of a PREDICTION in a library, which then would be part of the Library of above # 3.).
The AIM here however must be, that it must be possible to open that Library/Cabinet and just PULL PARTS OR the whole of a trading strategy or prediction, with the MOUSE into any chart AND also FROM chart TO chart that is/are currently open on my screen and have it all analyzed.
The functionality and flexibility of this goes far beyond the current rather simple 'templates' and far beyond the current 'add chart page'.

8.)
TOPOLOGICAL RELIEF MAPS and SCATTER DIAGRAMS
must be introduced to create excellent VISUALIZATIONS of TEST RESULTS.
This way, many things often become instantly clear and can shorten further development time of systems considerably.

9.)
When hours long analyzing is in progress, it would be extremely interesting for a variety of reasons, to have a colored DISPLAY BOX available, see above # 8.) that is ALIVE and actually shows each and every combination that is just analyzed at that point in time and further, strongly VISUALIZES how the OPTIMIZATION PROCESS is PROCEEDING.
This is comparable to a see-through, transparent actual model in a technical museum that shows all the inner workings of an automobile engine and that teaches viewers instantly how that 'thing' is functioning.

Your data is fairly old, so you may need to set your chart format to go back that far. Go to the Edit menu, then Format Chart, then adjust the first and last dates loaded so that it covers the dates of your data.

using tradestation data

Date :10/1/2002 10:21:09 PM Poster : ed condon

Is it possible, or is ward working on using data feed from tradestation in NST? Am presently using TS. Is it possible to use TS so a client doesn't have to subscribe to quote.com also?

thank you

ed

Re: using tradestation data

Date :10/2/2002 1:30:27 PM Poster : Eric L. Hoyle, CFA

Ed,

I've brought this up also. NS Trader has in the past had the ability to use the Omega Global Server as a data source, although this was an unsupported feature due to problems with the Global Server. It is my understanding that Ward is currently working on interfacing with the new Tradestation, however, Tradestation has been slow in providing Ward with the necessary details.

A agree that it would be nice to have a Tradestation connection. I hate paying multiple exchange and data feed fees. The "Data Pump" add-on that Ward has also mentioned is another possible solution. As I understand it, this would allow users to program their own interfaces between NS Trader and outside data feeds. I would like to work on one for Bloomberg, to utilize their vast amount of data, when it becomes available.

There will definitely be more data solutions in the future, right now it's just a matter of time.

Here's the TradeStation story:

In TS4 and TS5, when Omega provided an API to get at their data, we could access it. That access is there now in NST. For daily bars it is supported; for intraday bars it is available only for TS5 and we do not support it. That non support is because Omega would not look into problems we found, probably due to the fact that they were heavily working on TS6. For some people with NST (Daytrader) it works, for others it does not. (We think success depends on how many tickers you try to load up - the crashes happened with users trying to load hundreds).

When TS6 came along TS took away the API open access and so far TS has not agreed to put it back. Maybe if enough TS users ask them, they'll open it again.

However, we have always had the ability to get TS data through Easy Language. All NST versions can export data streams from a TS chart to an NST chart, and import other data back. This works on TS4.5, and 6, but the disadvantage is you have to have both programs and both charts up at the same time. You'll need a big, fast computer probably. Also, up to NST3.7, you can only import and export daily bars. In NST4.0 (Daytrader), you'll be able to import/export intraday bars down to 1 minute.

Hi,

There is a way to get Quote data into TS2000i. I have tried to write a DataX Server DLL called from EasyLanguage to poll my charts, unfortunately without any success so far.

Has anyone tried this before?
Otherwise, I hope NSDT 4.0 will be released shortly...

Bruno

In TS4 and TS5, when Omega provided an API to get at their data, we could access it. That access is there now in NST. For daily bars it is supported; for intraday bars it is available only for TS5 and we do not support it. That non support is because Omega would not look into problems we found, probably due to the fact that they were heavily working on TS6. For some people with NST (Daytrader) it works, for others it does not. (We think success depends on how many tickers you try to load up - the crashes happened with users trying to load hundreds).

When TS6 came along TS took away the API open access and so far TS has not agreed to put it back. Maybe if enough TS users ask them, they'll open it again.

However, we have always had the ability to get TS data through Easy Language. All NST versions can export data streams from a TS chart to an NST chart, and import other data back. This works on TS4.5, and 6, but the disadvantage is you have to have both programs and both charts up at the same time. You'll need a big, fast computer probably. Also, up to NST3.7, you can only import and export daily bars. In NST4.0 (Daytrader), you'll be able to import/export intraday bars down to 1 minute.

Ed,

I've brought this up also. NS Trader has in the past had the ability to use the Omega Global Server as a data source, although this was an unsupported feature due to problems with the Global Server. It is my understanding that Ward is currently working on interfacing with the new Tradestation, however, Tradestation has been slow in providing Ward with the necessary details.

A agree that it would be nice to have a Tradestation connection. I hate paying multiple exchange and data feed fees. The "Data Pump" add-on that Ward has also mentioned is another possible solution. As I understand it, this would allow users to program their own interfaces between NS Trader and outside data feeds. I would like to work on one for Bloomberg, to utilize their vast amount of data, when it becomes available.

There will definitely be more data solutions in the future, right now it's just a matter of time.

Mapping two parameters that differ by one

Date :10/6/2002 9:26:54 PM Poster : John Gotwals

I would like to create an indicator that returns the difference in Close for N and N+1 bars ago. I plan to use this indicator in the Prediction Wizard.

To create the indicator I started with the Subtract and Lag indicators, but I have a problem in figuring out how to end up with just one parameter for N. The indicator looks like this -
Subtract
Operand #1 = Lag(Close,1)
Operand #2 = Lag(Close,2)

It seems to me that during optimization, the Prediction Wizard will independently vary the second argument of both Lag indicators. How do I replace those two parameters with one parameter, while maintaining the difference of one between the two actual arguments?

Any advice and help will be greatly appreciated.

Re: Mapping two parameters that differ by one

Date :10/7/2002 10:11:12 AM Poster : Eric L. Hoyle, CFA

Try this. After you have created the indicator, hit the "Save Indicator" button from the indicator wizard. Hit the "Advance" button that appears in the lower right of the next box that appears, the "Save Template" box. From there, you can double click on any of the parameters (or highlight them and hit the "Modify" button) and map them to another parameter. Someone correct me if I'm wrong, but I believe, once two parameters have been mapped to the same variable, they will not change independently. I hope that helps.

You can do it by subtracting as you have done, but when I do this, I just lag the momentum indicator, with the momentum parameter set to 1. Regarding the optimizer changing the parameters, you can tell it not to optimize certain parameters.

Redundant Haar

Date :10/7/2002 3:49:19 PM Poster : zawie

I've been researching into Redundant Haar Wavelets (they don't suffer from End Point Distortion). Looking at the thread back in 2000 where some examples were given, and a message by Steve Ward saying that he's seen some good nets with RedHaar I came to the conclusion they would produce something useful.

But currently I've had no real results with them. I tried Victor's recommendation of feeding scales 1-6 into a net and trying to predict scale 3.

Sure enough I got superb correlation (0.91) and an MSE of 0.050 and a lookahead of 5 bars on pretty much any stock/index. This made me suspicious. When I investigated futher, it turned out that the scale 3 was lagging by 5 bars anyhow, so though it was a good predictor of scale 3, it didn't seem much use because it wasn't predicting ahead.

Can anybody shed any light on the best way to use these indicators?

Regards
Mark Simpson

Removing a DLL

Date :10/8/2002 5:23:48 AM Poster : Tom Nunamaker

How do I uninstall a DLL after I have it installed with NST? I'm building a DLL in C++ and I'd like to remove my test DLL's as I write it's replacement. I can't find it in the help or on this forum. Any ideas?

Thanks

Tom

Re: Removing a DLL

Date :10/8/2002 9:23:59 AM Poster : Xprogrammer

It isn't installed at all. All you have to do is replace it, and NSTP will just load the new one as long as it has the same name. You might want to read how dlls are handled in release 3.7, because you have a choice as to how they are loaded. Read that in the section called Changes in Documentation.

On 10/8/2002 5:23:48 AM Tom Nunamaker wrote:

Re: Removing a DLL

Date :10/8/2002 3:24:13 PM Poster : Webmaster@ward.net

Yes, that's a different question. That is replacing the custom indicator that calls the DLL. If you didn't change the name of the DLL or the calling parameters of the functions, Xprogrammer is right, you don't have to do anything but change the DLL.

If the DLL name or calling parameters change, then you can modify the indicator, then reconstruct the original, then resave it. Only problem is you will have to resave under a different indicator name, because the old one is still there.

Anytime you want to remove a custom indicator, you can manually delete the .tpl file for the custom indicator, which you will find in the template folder. Do it while the Trader is not running.

We should have mentioned that you can also delete a custom indicator .tpl by using the delete key once you select that indicator from the appropriate category in the indicator wizard, which is easier than erasing it.

Stop and limit orders

Date :10/8/2002 10:36:53 PM Poster : Rob Lenderman

When a condition is met I want to set a stop order for a price slightly above the current price. It works fine if the next bar reaches my price, but how do I simulate my stop order being hit a few bars after I set it the way it would happen if a real broker had entered my order?

Rob Lenderman

Re: Stop and limit orders

Date :10/10/2002 10:49:55 AM Poster : chris wong

use the slippage parameter for that.

Re: Stop and limit orders

Date :10/10/2002 8:36:12 PM Poster : Rob Lenderman

I think I am not explaining what I see happening very well. It appears that when I have a buy condition met and generate a buy order with a stop a few points from the current price that my stop order is only active for one bar. If I break the stop limit after two or more bars away it is never filled. The docs say that stop orders are active for one bar from when the buy signal was generated as a day order. This is fine if I am generating a buy order for the next day(next bar), but when trading intraday I want the order to last until I change it or it is met. That is what would happenn if I entered the order with my broker, but this only appears to have it last one bar. this is what the docs say.

"If you select a stop order, limit order or stop limit order be sure to enter the corresponding stop price and/or limit price. Note that the stop, limit and stop limit orders are day orders and are therefore canceled if not filled by the end of the next bar. If you want to trade from the open to the close of a single bar, use a market order to enter at the open of the next bar and a market close order with the same conditions to exit at the close."

Batch Runs

Date :10/9/2002 1:50:45 PM Poster : Maciej

Hi,
Have you any ideas how to run a batch of charts all Futures (ie Soybeans) but for differing contract periods / time frames - if 60min for SX2, SN2 .. then Daily SX2, SN2, ... note that the start and end dates for each contract month vary ie all SN2s end in July , all SX2s end n October etc. Obviously if the start/end dates are all the same then its easy for a given time frame.
Thanks in advance.

Re: Batch Runs

Date :10/10/2002 11:06:14 AM Poster : chris wong

i think you'll have to have a chart for each time period, but you can still start them all off running at once. just use several copies nst running at once. there's a tip about that somewhere i recall and i use it all the time to run several lots of different things.

On 10/9/2002 1:50:45 PM Maciej wrote:

curve fitting

Date :10/12/2002 9:31:21 PM Poster : jk

It has been detailed in various ways that curve fitting solutions/systems are to be avoided (the system will not work on out of sample data). Much effort is spent on avoiding curve fitting (walk forward etc etc) which I will assume is obvious to this board and will not reiterate .
However, aren't we really being led down the same path with an iterated "out of sample" data series that is positive? By iterated I simply mean one simply just plugs and chugs until the "out of sample" looks nice with minimal draw down etc etc and that is a "workable" system. We are just curve fitting on different data.
I have seen this question posed in various places however, I have never really seen anyone who utilizes these techniques answer them directly. Saying that they "work" and that is good enough is not really what I am looking for (if that is your thought - read "FOOLED BY RANDOMNESS"....amazon.com <$20). Or if you read the book any thoughts on the book in the context of curve fitting would be very useful seeming to all who subscribe.

Any thoughts on this issue would be most welcome.
Thanks in advance-
jk

Re: curve fitting

Date :10/13/2002 2:00:06 PM Poster : jk

Yep, I believe your thoughts are valid and well said. I was wondering if others on this board had any other ideas on the topic.

Secondly, there are other statistical methods to determine if an issue is "tradeable". An example would be "continuity" . Continuity being defined by quantifying (chi-squre) the price movements to see if they repeat. If they repeat to a chi square of X ....this would lead to a candidate for prediction. This provides me a black and white answer ...kinda nice in this fuzzy world.
The problem of finding a tradable issue has come up several times with various answers and varrying degrees of robustness. These techniques do not fit within the trader context as they take a different mental path toward features/upgrades (current mind set seems to be to add more depth to the current capability).
I wonder if some in the NS user community would like to see features that are more fundamental to "trading" than adding "nicities" ?

As Ward products have been (in my opinion) far more forward thinking (the problem of out of sample testing is taken head on-problems and all) than other products; I wonder if other users have similiar thoughts at looking at the problem from various perspectives as well. I wonder too if those ideas might be of better use of a programmers time than adding "nicities".

Re: curve fitting

Date :10/14/2002 12:10:10 PM Poster : zawie

Yep, bear in mind Steve Wards comments on that one :-)

I always keep either an out-of-sample, out-of-sample, or I'll reset the model to start from an earlier date and see if I still get good results. (so all my training sets, change).

Then I'll check it on additional stocks.

No hard and fast rules on it, I eye-ball it. But be careful not to end up doing the
same thing all again. Theorectically you could go to inifinity.

It's is a major modelling concern, and you can never be too careful of this problem. I've seen a few people with models that they think work well, but when you investigate you find that the out-of-sample has been rendered in-sample.

Another common problem is feeding data that the net already knows about into the net such that the net is no longer predicting the future, as it already knows about it. The net has brilliant MSE and correlation values, and you make tons of money on paper. Those are the warning signs, and also you tend to get a glitch (sharp jump) where the Actual Signal on the net ends.

An example of this would be, trying to predict MACD 2 periods in advance. With open/high/low/close (or some function of) as inputs. This net would produce superb results. BUT. Macd is a lagging combination of a function on high/open/low/close. So the net learns to immitate the formula for MACD, pretty well and you get superb results. To be useful, you'd want to say predict it 10 periods in advance. But if you do this, you'll find those unbelievable results have disappeared.

What you're predicting is important. Percent change in open is safe, but anything else can be dangerous. To check, pull up the indicator you're predicting against the chart and see how much lag you have. You then want to predict ahead more periods than there are lag (to be totally safe, there are exceptions) to make sure you're getting a real solution.

Curve Fitting, Out-of-Sample Testing, and Multiple Timeframes

Date :10/16/2002 11:38:09 AM Poster : Steve in California

Jk's note asking about other thoughts prompted this note.

It seems to me that questions centering around curve fitting, out-of-sample testing, and multiple timeframes are related in the following way. (I should state at the outset that the ideas I sketch below are based on a lot of multiple timeframe bar observation but NOT on a significant amount of testing of results acquired through work with NSDT.)

I believe that out of sample testing results are often different than in sample results for a single simple reason. The reason is that larger timeframe market contexts are ignored.

My hypothesis is that a momentum indicator signal sometimes succeeds and sometimes fails such that it is unreliable per se, because the state of the trends in multiple larger timeframes are different. The weight that one should assign to a momentum indicator buy signal needs to be different when multiple larger timeframe trends have just begun to turn up than when larger timeframe trends have just begun to turn down.

I believe that out of sample testing results are often different than in sample because the state of larger timeframe trends is different in sample and out of sample. A net that is in sample "curve fit" to trade well in a larger timeframe uptrend is much more likely to trade well in an out of sample period in which the larger timeframe trends are also up than when the larger timeframe trends are down.

My hypothesis is that "curve fitting" in itself is not necessarily a negative thing per se. It's a huge problem though if one ignores the larger timeframe market contexts for which a net has been trained. In this case, the out of sample results will be disasterous.

So, the practical question is how one might do filtering of signals generated from a single timeframe in NSDT based on the trend in multiple larger timeframes. (IMHO, one larger timeframe is not enough.)

An approach I've begun to experiment with is to use the NSDT Rule Indicator "if CONDITION #1 then =X elseif CONDITION #2 then =Y else =Z". The idea is to establish tradeable larger timeframe trend states in condition #1 and condition #2 such that X and Y can be used to establish solid in and out of sample single timeframe signals. Z, I'm thinking, is the default "no trade" state.

To tie this thought back to the note subject line: the idea here is to reduce the degree to which curve fitting is a problem (hence, out of sample results aren't good) by establishing solid market contexts in which signals may be trusted in conditions 1 and 2.

Any thoughts on this approach or an alternative are much appreciated.

Re: Curve Fitting, Out-of-Sample Testing, and Multiple Timeframes

Date :10/20/2002 7:21:40 AM Poster : Chris Alford

Steve,

If I understand your proposal there are two concerns:

(1) insufficient data is included in sample to adequately predict the current market state because of a lack of data for the higher timeframe, or
(2) the signals are possibly only accurate for some of the higher timeframes.

To deal with (1) you only take signals for higher timeframes that are well represented in the in-sample data set.

The simple solution would be to have sufficient data so that all higher timeframe market states are adequately represented. In this case higher timeframe values can be inputs to the model, and better if the inputs are continuous variables than discrete.

I had been thinking of a related problem recently.

I do forecasts for the next trading day. I classify the type of day (eg up, down etc) in my history data, and do a forecast for the next day of the probability of each type of day occuring. I also forecast trading ranges for the next day, and I was wanting to experiment and see if I could do meaningful intervals about these ranges depending on the type of day forecast to capture extreme days. The trading ranges have to be somewhat smoothed by the regression, and I don't get a feel for the range of the high or low forecast. For example if the open turns out to be the low for the day, then I want to know the likely high for an UP day. It would be rare for the forecast low to be at the open value.

I don't have the day type in the inputs, partly because it is a discrete variable, but also because it is implicit in some of the OHLC inputs I have. As an experiment, what I would like to do is have a filter so that only records for days that match the previous day type as used as input to the prediction. As a secondary filter I could only use those days that were up days for example in the insample.

In econometrics there are some ways of determining the forecast interval, a range for the point estimate, at some level of error. What I am trying to do here is put an interval around the trading range for the NST forecast. I'm not sure what the best approach might be, or even if any statistically meaningful result can be generated.

The problem I see with the Rule Indicator approach is that you do not automatically know whether you have any or enough data in the in sample data of the market state reflected in the out of sample data. If you knew beforehand that all the insample was from a larger timeframe uptrend, then predicting out of sample downtrend would be dubious.

In your case the larger timeframe might be the filter. I think I am asking for something different to your condition approach with the filter. Would be interested in your comments on my idea.

As an aside I would expect you would get a different buy signal for each of the higher time frames compared to that of the lowest. You could take the lowest timeframe buy after the buy in the highest timeframe is signalled, but by then half of the profit in the trend will have evapourated. Its like buying a dip in an established uptrend. Many of the buy signals in the lowest timeframe will be wrong, but if you get confirmation in the higher timeframe you stay with it and widen the stop from that of the lowest timeframe.

Re: Curve Fitting, Out-of-Sample Testing, and Multiple Timeframes

Date :10/22/2002 9:25:00 AM Poster : Steve in California

Thanks Chris for the feedback. You've raised many interesting points and questions so I thought I'd reply with comments within your note prefixed by '****'.

On 10/20/2002 7:21:40 AM Chris Alford wrote:

Steve,

If I understand your proposal there are two concerns:

(1) insufficient data is included in sample to adequately predict the current market state because of a lack of data for the higher timeframe, or
(2) the signals are possibly only accurate for some of the higher timeframes.

To deal with (1) you only take signals for higher timeframes that are well represented in the in-sample data set.

The simple solution would be to have sufficient data so that all higher timeframe market states are adequately represented. In this case higher timeframe values can be inputs to the model, and better if the inputs are continuous variables than discrete.

**** I think it's unnecessary and, in fact, impossible to represent all higher timeframe market states.

I had been thinking of a related problem recently.

I do forecasts for the next trading day, I classify the type of day (eg up, down etc) in my history data, and do a forecast for the next day of the probability of each type of day occuring. I also forecast trading ranges for the next day, and I was wanting to experiment and see if I could do meaningful intervals about these ranges depending on the type of day forecast to capture extreme days. The trading ranges have to be somewhat smoothed by the regression, and I don't get a feel for the range of the high or low forecast. For example if the open turns out to be the low for the day, then I want to know the likely high for an UP day. It would be rare for the forecast low to be at the open value.

**** John Clayburg has written an interesting book ("Four Steps to Trading Success") that includes interesting analysis of early in the day highs and lows…

I don't have the day type in the inputs, partly because it is a discrete variable, but also because it is implicit in some of the OHLC inputs I have. As an experiment, what I would like to do is have a filter so that only records for days that match the previous day type as used as input to the prediction. As a secondary filter I could only use those days that were up days for example in the insample.

**** It's not clear to me how one would create a "filter so that only records for days that match the previous day type" would be used.
**** Tony Crabel has written a book that is concerned entirely with Narrow Range Days and Opening Range Breakouts. It's entitled: "Day Trading with Short Term Price Patterns & Opening Range Breakout".

In econometrics there are some ways of determining the forecast interval, a range for the point estimate, at some level of error. What I am trying to do here is put an interval around the trading range for the NST forecast. I'm not sure what the best approach might be, or even if any statistically meaningful result can be generated.

The problem I see with the Rule Indicator approach is that you do not automatically know whether you have any or enough data in the in sample data of the market state reflected in the out of sample data. If you knew beforehand that all the insample was from a larger timeframe uptrend, then predicting out of sample downtrend would be dubious.
**** As you point out, ensuring that there is adequate representation of both up and down moves within the in sample set is clearly important. My thought is that this is less of a problem when working with intra-day bars rather than Daily/Weekly/Monthly bars.
**** Steve Ward has stated that somewhere between 3-5 years of daily bars is an adequate number of in sample bars for training. Practically speaking, this number of bars certainly contains a good number of different relationships among trends at the daily, weekly, and monthly timeframes.
**** I'm concerned with extremely small timeframes and index futures. For these timeframes, several thousand bars available in a week to 10 day of trading provide a range of relationships among different timeframe trends.
****In short, unless I'm missing something (which I often do) I don't see having enough representative in sample data as a problem that cannot be managed.

In your case the larger timeframe might be the filter. I think I am asking for something different to your condition approach with the filter. Would be interested in your comments on my idea.
**** Again, I'm not clear about how one would create such a filter other than to create a distinct net for each significant larger timeframe market context that one wants to classify. Is that what you have in mind?
**** I take it by the reference to "NST" that you are using daily data only. If this is true, I'm not certain about the probability of success. It seems to me that the use of large timeframe intra-day data would be helpful.

As an aside I would expect you would get a different buy signal for each of the higher time frames compared to that of the lowest. You could take the lowest timeframe buy after the buy in the highest timeframe is signalled, but by then half of the profit in the trend will have evapourated. Its like buying a dip in an established uptrend. Many of the buy signals in the lowest timeframe will be wrong, but if you get confirmation in the higher timeframe you stay with it and widen the stop from that of the lowest timeframe.
**** You're on target that a problem is that the strategy on the long side amounts to "buying the dips". Your comment has prompted a thought. In using the Rule Indicator as described in my initial note: Why not set up Condition1 as a net that establishes the larger timeframe trend as being in the same direction as the timeframe being traded (e.g., buy the dip) and then set up Condition2 to try to anticipate a reversal in the larger timeframe trend upon a change in the smaller timeframe (i.e., bottom fishing). I would expect that losses would be more frequent for Condition2 trades rather than Condition1 trades but Condition1 trades more profitable.

There is another way you can do this. There's a special value called *
or 3.4E38 which you can enter into any neuroshell numeric field. This
will set that particular bar to nothing, nada, zip. By my understanding,
if the neural net doesn't have any data it can't calculate the value, so it
doesn't train on it, and doesn't make a prediction. You will see a gap in your data everytime you use this value. So just train it on a "Rule" based prediction, which sets "*" for the value where you don't want any prediction. Also, on a side note, as you now have less data, you'll might have less than the minimum required for your training sets etc, so increase the size if necessary. (You'll spot it easy enough in the prediction output).

Regarding Multiple Time Frames, I've been doing quite a bit of research on the
area. Neuroshell doesn't currently support multiple timeframes (though
I think it's in the works at some point), so currently you have to be a little
creative to use multiple timeframes with NST, and it's also beneficial if you can
write you're own DLL's.

Here are some of the ways I've either implemented, or could be used to implement Multiple Timeframes in NST:

1. Simple MTF's (not true), but adequate for most purposes, is to say pick
a 20,80,3200 day moving average. It really depends on the indicator whether
you can get away with this or not. An indicator that takes any other time series except the close, i.e. say something that used the high and low of a bar, probably not.

2. Bring up 3 charts at different timeframes, and use DataX Api (from Ward) and a custom app. Very clean on the chart/indicator end, but not too elegant
on the custom app end. It really depends on how many timeframes you're doing.

3. Program yourself an indicator, which divides down the timeframe. But,
if you want to use any other indicators, you'll probably end up coding them
to take the new timeframes, because the NST indicators will be expecting data
in the base timeframe format.

4. Program yourself an indicator, which deletes bars from the data, and
drops data out of the time series (using the 3.4E38 as above). Then realign
the data to the end of each time interval. This works well, and doesn't
upset the NST indicators. I use this method to do most of my MTF work.
At some point in the future, I'll release the indicator I've created to do this

None of these methods are ideal, they're just a fudge to get MTF's into
Neuroshell, until it's a feature. What makes NST such a good product is
the fact that you can interface to it, and do these weird and wacky things :-)

Other issues that need to be considered when producing MTF's are the following:

1. Scale. Conventional thinking is each timeframe being 4-6X the lower timeframe in length. I've also found that multiple mini timeframes, each one slightly longer than the first, when combined can be powerful. For instance, you might decide to combine 200 timeframes, each one only slightly bigger than the previous. (You'll need to custom program for that).

2. Quantity. Again conventional thinking suggests 3 timeframes, small, medium and large. You trade in the medium, look to the large for confirmation of the overall direction, and execute the trade entry in the small timeframe.

3. EPD (End Point Distortion). The problem with MTF's is that the bar at the

higher timeframe, may not be complete at a particular point in time. I.E. Say
you were trading intraday bars, and using a daily MTF. The daily MTF wouldn't
be complete till the end of the day, so if you were trading intraday, you'd be
using yesterdays bar for the daily and not todays. The futher you are away from this point, the more EPD you suffer. The method, I've investigated is picking a "day window" and rolling it forward at each intraday bar. Therefore at any point in time, you no longer have the EPD resulting from using a higher timeframe. (though obviously the data at that timeframe changes quicker now). The "daily" example here, is a bit of a bad example (as I can think of reasons why you would want to keep a day timeframe in it's correct timeslot), but it's a bit clearer to understand as an example.

4. Daily timeframe is special. Whilst we're on the day subject, the daily timeframe is a little bit special in terms of how it's traded. For instance timeframes which cross the day boundary (i.e. say you have 1hr, daily, weekly
timeframes) are crossing the boundrary between intraday trading and longer
term trading. Just be aware that the "Day" has some special properties as a
timeframe due to this. E.G.. Daily high/lows often serve as support/resistance, etc.

MESA Add-On

Date :10/18/2002 1:39:39 PM Poster : Maciej

Can anyone confirm that the Mesa addon has the trend/cycle indicators in the NST version. Presumably the price don't get coloured as in the stand-alone version but thats secondary, simply do they exist.
Thanks in advance

Re: MESA Add-On

Date :10/28/2002 2:40:51 PM Poster : Eric L. Hoyle, CFA

I bought the MESA indicators a while ago (a couple of years???). I don't know if they've been updated, but what I received was the following indicators: MeasDomCycle, MesaLeadSine, MesaMA, MesaPhase and MesaSine. I believe a number of those indicators are available for download from Ward's S&C tip section. I haven't done a comparison to see if they're exactly the same, although I do know that the MESA indicators I purchased allow you to have the Dominate Cycle input change, compared to the free version, where I believe that input is a constant. I hope that helps.

In fact we have just yesterday found the problem and it is a bug in release 3.7. The bug affects many PowerBasic DLLs causing crashes. It is serious enough that we will be putting up a release 3.8 very shortly that corrects the problem. The bug did not exist in release 3.5. We apologize for introducing this error.

Eric,

The following indicators exist with the latest Mesa2002 for NSDT:
MeasDomCycle, MesaLeadSine, MesaPhase and MesaSine, MesaInstTrend, MesaKalmanFilter.

My first impressions based on the DJ index are that

a) interpreting these indicators particularly into a mechanical trading systems doesn't seem easy. For me making the call between trending/rangng modes is as much as an art as anything else.
b) The Sine crossovers as the book says generate signals well ahead.
c) Time frame seems very important - the results seem to be better using 30min bars than say 5Min bars

For the time being Mesa is for me a number of interesting indicators to use in conjunction with other non-Mesa indicators. Perhaps other symbols would give better results.

What would be nice is to have the abililty in NSDT to use the output of say Mesa DomCycle as an input into say MovAvg eg: movavg(close,mesadomcycle) which is not possible at the present time.

Hope this feedback helps.

In NSDT when you use the indicator wizard to create a simple moving average, you have two parameters, a) the time series default close and the Avg Periods which can only be a numeric value and not another indicator or variable. so without special programming it's not possible to have a dymnamic moving average.

In our Advanced Indicator Set 2 add-on we have a Variable Length Moving Average that does exactly what you want. The averaging period parameter can be a time series (e.g. another indicator).

b) The Sine crossovers as the book says generate signals well ahead.
c) Time frame seems very important - the results seem to be better using 30min bars than say 5Min bars

For the time being Mesa is for me a number of interesting indicators to use in conjunction with other non-Mesa indicators. Perhaps other symbols would give better results.

What would be nice is to have the ability in NSDT to use the output of say Mesa DomCycle as an input into say MovAvg eg: movavg(close,mesadomcycle) which is not possible at the present time.

Hope this feedback helps.

Re: MESA Add-On

Date :11/11/2002 11:34:33 AM Poster : Steve Kratochvil

Incase someone needed the EMA with a variable length, I have sent it up as EMAVariable.zip. It will build a new category of indicators called "Core Indicators" after you unzip the file into your TEMPLATE directory for NeuroShell.

The file referenced in this post can be downloaded using the following link:

EMAVariable.zip

Enjoy,

Steve

On 11/8/2002 4:38:15 PM Webmaster@ward.net wrote:
In our Advanced Indicator Set 2 add-on we have a Variable Length Moving Average that does exactly what you want. The averaging period parameter can be a time series (e.g. another indicator).

On 11/8/2002 12:41:24 PM Maciej wrote:
In NSDT when you use the indicator wizard to create a simple moving average, you have two parameters, a) the time series default close and the Avg Periods which can only be a numeric value and not another indicator or variable. so without special programming it's not possible to have a dymnamic moving average.

On 11/8/2002 8:00:31 AM Maxwell Craven wrote:
Why is it not possible to apply a moving average?

On 11/8/2002 5:24:51 AM Maciej wrote:
Eric,

The following indicators exist with the latest Mesa2002 for NSDT:
MeasDomCycle, MesaLeadSine, MesaPhase and MesaSine, MesaInstTrend, MesaKalmanFilter.

My first impressions based on the DJ index are that

a) interpreting these indicators particularly into a mechanical trading systems doesn't seem easy. For me making the call between trending/rangng modes is as much as an art as anything else.
b) The Sine crossovers as the book says generate signals well ahead.

Re: MESA Add-On

Date :11/8/2002 5:17:38 PM Poster : Eric L. Hoyle, CFA

Maciej,

Thanks for the info on MESA. It sounds like the indicators are similar to the ones I bought except for the last 2. I spoke to Ehlers and he said that the latest version was an evolution of the earlier indicators and offered me an upgrade for $175. FYI, to anyone else who owns them.

I never had a lot of luck with them, but I may go back and look at them again. They seemed interesting, I just never found a good way to apply them. It seemed a lot of art, which is hard to model... Thanks for the info and advice.

Sincerely,

Eric

Yes, MESA add-on has the trend/cycle indicators in the NST version. However, it's not in the general MESA2002. You should ask for MESAWARD version that contains MESA2002Mode.tpl and mmd2002.dll files which will generate trend/cycle (1,0) signals. I have just intalled MESA add-on and it works so well that I use as my basic trend following trading strategy.

Hope this is useful to you.

Three Bar Net Line (Powertool Strategy)

Date :10/29/2002 3:40:48 PM Poster : Maciej

In the May 2002 Active Trader issue there is trading strategy that uses Joseph Stowell's Three bar Net Line. Has anyone coded it in NSDT? If so could you share it?
The tricky bit is that it looks back an unknown number of bars to find the (in the case of an up trend) the most recent high and then further back to find first a low that's lower then the recent high's low and then another low that's lower than the low of the first low. (For a down trend its reversed).
Any hints on how best to code such an indicator would be most welcome.

Re: Three Bar Net Line (Powertool Strategy)

Date :10/31/2002 2:21:32 AM Poster : zawie

Yes, I have it coded from a while back. Do you want Bull/Bear power from the
same article too? There are no help files written for it, though as you have
the original article it should be easy enough to figure.

Also, how do you prefer it, do you have Visual C++, and want the source?
Or would you prefer it in DLL form?

Mark Simpson

Mark,

Just the dll would be fine - I tred to figure it out as a NSDT indicator but its not too evident. I don't use VB or C++ myself.
What were your experiences with the approach discussed in the article?

Thanks in advance.

Re: Three Bar Net Line (Powertool Strategy)

Date :11/3/2002 4:30:31 PM Poster : zawie

The file referenced in this post can be downloaded using the following link:

PowerTool.exe

Find attached "PowerTool.exe" which is a self installing exe file.
Everything should install in the correct places.

The important things contained are:
ThreeBarNet (As Support)
ThreeBarNet (As Resistance)
Bull Power
Bear Power
Powertool.cht
Powertool.dll

All the indicators will automatically install under the "Power Tool" category, and
the chart should be in "Charts".

ThreeBarNet has been implemented as Support/Resistance and with a
number of periods lookback. The reason for this is the article is
a little vague, i.e. "Current Upswing", so I've implemented it as a rolling
indicator. As you can't draw multiple lines on the graph, just mentally
extend the lines forward.

Bull/Bear Power are implemented as written.

For people who don't have the original article:

"Three-Bar Net", is a line drawn when prices have
been rising recently, you first find the highest high for the
current upswing. This becomes bar1. You then look for the
next previous bar and find the low which is lower than the low of
bar1, make this bar2. Do the same again, and make that bar 3.
The ThreeBar Net line is line extending from the low of bar 3.
This is called "Three-Bar Net" support in my implementation.
Conversely for "Three-Bar Net" resistance.

Bull/Bear power measures the control of the bull/bears over the price.
In sideways markets bull is normally above zero, bear is below.
In uptrending markets bull/bear are normally above zero. In downtrending,
bull/bear is below zero. I've noticed in researching it that there is a bias
(and difference) between
bull/bear in trending markets, which serves as a good indicator for trend
breakdown.

Using these indicators together builds the "Power Tool Strategy" as
described in the article.

The chart is the example from "Figure 8", Agilent Technologies (A).

The article is from "Active Trader", May 2002, Volume 3, No.5

My personal research notes show on the daily timeframe, bull/bear/ThreeBarNet
work quite well. Intraday timeframe (mainly my area of interest), bull/bear are
strong, but ThreeBarNet doesn't do as well.

I use Bull/Bear Power (and a jurik'd version of it), in a number of my models.

In the spirit of "Forum Particpation", I would appreciate it if, when you write the
"PowerTool" Trading Strategy using these indicators, you could post the resulting
chart to the forum for everybodies benefit.

As you can appreciate, it takes
time to get things like this into a package fit for public consumption, and I would
consider submitting a chart to everybody as an equal contribution to the group and incentive for me to continue submitting the indicators I have developed. :-)

By sharing research, we will all reach our goals faster.

Happy Trading.

Free Z Jurik Add-On Attached

Date :11/17/2002 2:30:55 AM Poster : zawie

As promised, here is the free Z Jurik Add-On.

The file referenced in this post can be downloaded from:

ZJurikV10.exe

This Add-On uses the Jurik indicators, so you will need at least one of the Jurik indicators, before this add-on will have any value to you. However if you want to see what's in this module before purchasing Jurik, then you can install and can browse the help file included (but the indicators won't work until you install Jurik).

This add-on contains 20 indicators, each one with it's own "help" and comes as a self installing executable. It also un-installs cleanly too (like all well behaving software should :-)).

Just a note about the indicators from Jurik Research. Their indicators are
extremely good, they really do perform like they say they do. The standard 4 indicators are: JMA, VEL, RSX and CFB. Typically they'll say DDR or WAV won't work with Neuroshell Trader, however this module implements templates (via a DLL and some special progamming) for them. So if you wish to buy these, you'll need to explain to them that the DLL version of WAV/DDR will work with this add-on if they query your purchase. DMX (also includes DMX Plus/Minus) is currently free from Jurik Research if you already own JMA.

Indicators In This Add-on

Jurik Replacements:

Z JMA / Z CFB / Z RSX / Z VEL: Implements the initial lead-in values correctly as missing data rather than 0. Has onboard help. If you still have the original Jurik templates, you can still use this Add-on, they won't interfere. If you wish to remove the original templates and use these instead, please remember to update any charts you are using them in.

Additional Jurik Indicators
(Allows usage of the following Jurik indicators in Neuroshell Trader):

Z DMX - DMI replacement
Z DMX Minus - DMI- replacement
Z DMX Plus - DMI+ replacement

Z DDR - Decorrelation and Dimension Reducer. Reduces many inputs into fewer inputs.

Z WAV - Compresses a data set into an efficient "time representation" of that data.

Example Indicators
(Examples coded from the Product Guide/Indicator Guides):

Z Adaptive VEL
Z Jurik MACD

Special Indicators
(These are indicators I've coded which use Jurik and that I've found to be useful):

Z Adaptive JMA - A dynamic length adjusting JMA.

Z Adaptive RSX - A dynamic length adjusting RSX.

Z Speedy MACD - A very fast Jurik'd MACD.

Z RSX Delta - RSX meets MACD in style.

Z VEL Delta - VEL meets MACD in style.

Z VEL Delta Signal - Signal line for the Z VEL Delta.

Z Jurik Bollinger Band High/Low - Highly responsive Bollinger Band replacements.

To install this self-extracting add-on, just click on the link in this message and
download the file to your machine. Then find the file in "My Computer" and double click on it and follow the instructions.

Have fun.

Regards
Mark Simpson
Bowfort Technologies Inc.

Re: Free Z Jurik Add-On Attached

Date :11/22/2002 11:49:33 AM Poster : zawie

I'd also like to add:

The add-on has been written for the most recent version of Jurik. I.E. These files should have the following dates:

\windows\system\JRS_32.DLL 11th April, 2002
\windows\system\JRS_FREE.DLL 11th May, 2002

If you're running an older version of Jurik, then I do have a workaround depending on how old your Jurik version is, just shout.

To be able to use any of the ZJurik Indicators with the word "Adaptive" in, or DDR, your Jurik must be capable of Real Time (the most recent version is).
You can tell this by looking for the functions "JMART, VELRT" in the pdf's you received with your Jurik purchase, if you have RealTime, you should find these functions in there.

Dear Ward Group:

Date :11/19/2002 4:03:29 PM Poster : Royce Vinson III

Is the functionality of linked optimization in the works???

Thanks Royce Vinson III, Chicago

Re: Dear Ward Group:

Date :11/24/2002 8:17:34 AM Poster : Steve Ward

Linked optimization is indeed in the works - it is something that is often requested. However, it is not in our coming big release - release 4.0 - which is already programmed. We need to get 4.0 out because it is already past the programming phase, so we cannot add to it now. We have been working on it over a year, but we are pretty close to user alpha testing now. It has the MOST requested feature of all, at least as measured by requests we've heard over the last 2 years - Esignal intraday and daily. After 4.0 gets out, we'll start adding features again. In the mean time, please read my comments in the thread here started 9/5/2002 called "Optimize one set of rules for both long/short entries".

On 11/19/2002 4:03:29 PM Royce Vinson III wrote:

Exponential Averages

Date :11/20/2002 1:23:06 PM Poster : Rob Lenderman

Can someone tell me the exp smoothing factor used in the exponential moving average function?

Rob

Re: Exponential Averages

Date :11/20/2002 10:04:04 PM Poster : zawie

This should help you. There are a couple of ways of calculating the smoothing factor, both equiv, here's one. Smoothing factor is a constant, so only has to be calculated once. i is the index in the array. So you loop around incrementing i through the series (input data).

There's debate about how to start off an EMA. The generally excepted way is
to start off with an SMA of "periods" length.

By chance, I just happened to have this code up on my screen when I
saw your message, spooky :-)

Mark Simpson
Bowfort Technologies

```
a = 2 / (periods+1L); //Smoothing factor

last_value = (a * (series[i] - last_value))+ last_value;
output[i]=last_value;
```

On 11/20/2002 1:23:06 PM Rob Lenderman wrote:

Rob

Re: Exponential Averages

Date :11/21/2002 3:00:58 AM Poster : Marco Calzolari

The formula is:
SF=2/(1+n)

where SF=smoothing factor
n=length (number of bars)
e.g. a 10 days exponential moving average uses a smoothing factor = 0.0909
But if you have the possibility to input directly the smoothing factor instead of the length, you could experiment with any number between 0 and 1.

Can someone tell me the exp smoothing factor used in the exponential moving average function?

Rob

Re: Exponential Averages

Date :11/21/2002 9:31:46 AM Poster : Steve Kratochvil

Calculation:

f * X + (1.0 - f) * Y

where
X = Time Series
Y = Exponential Moving Average one period ago (1st period Y is set to 1st period X)
f = 2 / (ExpAvg Periods + 1)

This is out of the NeuroShell help for the EMA and it is the formula that they are using.

Steve

There's got to be an easier way.....

Date :12/3/2002 2:25:55 AM Poster : gretsch

I have just started using Neuroshell and hope my post is not too naive. Steve Ward says Neuroshell has no scan & filter feature akin to MetasStock's Explorer, because " We screen, but instead of screening for stocks that match a particular pattern, we screen for patterns that work best with your stock"

But if we have no pet stocks and just like to trawl from a whole Exchange, it would help if Neuroshell could narrow down the choice from hundreds to tens before we do individual predictions.

My question is: Can the fuzzy indicators be used to describe a pattern that is good for prediction (e.g. regular cycles, sufficient liquidity, reasonable volatility), and then we make a chart of several hundred charts to score and rank the output to see how close they are to this fuzzy pattern description?

Re: There's got to be an easier way.....

Hi,

My solution is to use other software to do the pre-scanning, ie find those regular symbols(I work with futures) that seem to work best and then to use NSDT for it's neural engine as much as its set of idicators. To do it otherwise with NSDT would be a formidable task because of the varying multiplier factor for futures, ie x50 for grains, x 10 for cocoa etc as well as the problem of automating the changing contract months. Assuming I understand your question correctly I'd suggest that NSDT can be extremely useful when you already know where you're trying to head and wish to take advantage of the neural network capabilities.

In respect to your specific question, I'd suggest that its likely to be possible but I believe that this type of solution is not the most efficient approach to solving your problem.

Good trading!

Yes, I have begun to use other software for scanning and filtering. But the problem again is, there are no indicators that can filter for stocks with regular cyclical characteristics and/or are presently in a cyclic mode-the type of stocks on which the NSTP works best. MESA is not able to scan either. Looks like we'll just have to eyeball a list of charts, unless someone has some other bright idea? Ideas anyone?

If one can limit the search to EOD data, the best scanning software that I have seen is from Quotes Plus. They provide an EOD data service, by which the entire market is downloaded to your local PC several hours after the close.

This is done via a compressed data download; the data transfer is relatively fast (I guess several hundreds of kb's), and is then followed by an "unpacking/update" function, which updates a database on the local drive. After that point, you have the entire market stored and available locally for 5 or 10 years of data (I am not sure of the exact amount, except to say that it has never been a limiting parameter; and for futures, there is clearly a limit to the length of time).

The program also provides a function to automatically create Metastock format files from the raw local data, which are then available to all other application software, such as Neuroshell (or Metastock, etc.). The Metastock files are then automatically updated as part of the download/update process.

This data service costs something like$25 a month (though I am not sure of the exact amount).

For scanning, the software includes a scanning functionality via a simple language. There is a large set of pre-defined scans available, either supplied with the software, or available from independent web sites. For instance, one can scan the entire stock market to look for those stocks that are within defined parameters of stochastics, daily volume, ATR, some define price range, dmi/dmi+/dmi-, etc. etc. etc. The scanning software generates a "list" (.lst file) which isa simple text file containing then stock symbols (or futures or mutual funds) and whatever other data you choose to write to that text record , as defined by the programming language. I have copied two simple scans below, which show how one can scan for changes in data, and another that shows the use of technical indicators. They also have fundamentals built in for scanning:

This one references a previously created list of stocks in the file "ptatr.lst", and then creates a new list in the file "possibbull.lst". The (0) and (-5) are time shifts of the data, with 0 being the latest, and -5 being 5 days back.

```
//input = "ptatr.lst
output = "possibbull.lst";
if close(0) < close(-5) * .9
and low(0) < low(-1)
and high(0) < high(-1)
and close(0) >= low(0) + ( range(0) / 2)
then
println symbol;
endif;
```

The next example is a simple indicator scan, looking for MACD crossovers, with some other filtering:

```
// MACD CROSSOVER
Set MACD=12,26,9;
output="macdcross.lst";
issuetype common;
DaysRequired=220;
DaysToLoad=500;
if MACD(0)>MACDSignal(0) and
MACD(-1)<MACDSignal(-1) and
Close(0)>EMovAvg(0,200,c) and
Vol(0)>250000 and
Close(0)>10 then
println symbol , "," , open(0) :8:3,",", high(0) :8:3,",", low(0) :8:3,",", close(0) :8:3,",", vol(0) :8;
else
if MACD(0)<MACDSignal(0) and
MACD(-1)>MACDSignal(-1) and
Close(0)<EMovAvg(0,50,c) and
AvgVol(0,-29)>500000 and
Close(0)>10 then
println symbol , "," , open(0) :8:3,",", high(0) :8:3,",", low(0) :8:3,",", close(0) :8:3,",", vol(0) :8;
endif;
endif;
```

I don't know the details of all these scans -- just pulled them off the program archive. The web site explains more.

This scanning functionality, combined with the complete local database, allows the scanning of a large set of symbols to look for specific patterns which then may (and I say MAY here) allow the pre-determination of potentially suitable equities for further Neuroshell analysis. This is, of course, a function of your ability to determine a set of indicators for scanning that will in turn filter for the best candidates for Neuroshell. It may be possible to find fairly liquid symbols that have cyclic characteristics, for example, using some combination of conventional indicators. Then add filtering filter for options availability, average daily volume, suitable price range, etc.

At the end, you have a list, which then must be used for creating the Neuroshell set of charts. That is a manual step, unless there is yet another clever way to automate that process....

I use Quotes Plus for data, and sometimes for scanning. I will never return to a more conventional data service for my basic daily data. Of course, for RT or intraday, one still needs qfeed or esignal or some equivalent. It is hard to imagine a similar scanning functionality for large sets of symbols for intraday data -- the problem is just too large.

Sorry about the length of this....

Here are some that I current like to trade, and they all have single stock futures contracts too:

DELL, BNY, GENZ, MMM, and SBC

I actually decided upon them after I loaded all stocks with single stock futures contracts available. Then I ran a few models. These are the ones that held up, and you can see why by just looking at how the price fluctuates. I am sure there are other good stocks to examine, but right now I am concentrating on futures.

Retraining

Date :12/11/2002 5:22:19 AM Poster : Nalin Pasricha

When one presses the 'Retrain' button in the prediction wizard one gets the following options:

"Choose Yes to train only a more recent net. With this option , your current out of sample predicted values and trading points will remain unchanged. This option is recommended if you are currently trading this prediction"

"Choose No to retrain/ optimize all your walkforwards and current net on the more recent data. Note that retraining with more recent data will cause the out of sample predicted values and trading points to change"

I have a prediction which I have back tested using 200 walk forward tests of 1 week each - this way I have an out of sample back test of about 4 years. The prediction requires that I always have a position in the issue – either long or short.

The results of this back test look quite good - so I am anxious that the training procedure I use once I start trading closely reflects the procedure used in the back test.

My question is - which of the following training procedures should I use once I start trading - so that my training procedure closesly reflects what NST did during the back test. Should I

1. Retrain my prediction once a week using the option "Choose Yes..", or
2. Retrain my prediction once a week using the option "Choose No…"

Re: Retraining

Date :12/11/2002 1:44:53 PM Poster : Steve Ward

Perhaps if I explain the history of this option, it will be easier to understand. In the beginning of NeuroShell there was no option and it only took the "no" path. Note that after the walkforward data ends, your real trading starts with new data, but the real trading picks up where the walkforward trading ended. In otherwords, if you ended walk forward data in a long, then you start in the same long in the new data.

Now if you later come along and retrain with newer data, everything moves forward a little. Retraining can cause the old trades to be different, and therefore, the current trade could be different too. You could retrain and find that the new model says you should be short instead of long. That bothered people who were ACTUALLY trading the old model, because they may have been long.

So we added the option to guarantee that if you were actually trading, old signals wouldn't change on you in midstream.

But you aren't actually trading now. Therefore, you could use either option safely, but I'd choose "no". Either way, you are going forward with a newly trained net.

But to REALLY make sure you are using the same net you saw the results from and to make sure you keep those good results you got earlier, see this tip on this site: "Going Forward On The Same Net You Evaluated".

Re: Retraining

Date :12/26/2002 5:14:51 PM Poster : Steve Ward

When you select "Optimize on training set", then optimization takes place on the oldest walk forward training set. If there are no walk forwards specified, then optimization takes place on the current net training set.

So let's say there are two walk forwards. Optimization repeatedly changes parameters in the inputs, retraining the oldest net (wf 2 net) with each change. Eventually it finds the parameters that result in the best training for WF2. Then those parameters are frozen, and they are used for training WF1 and the current net without further optimization.

Trading Startegy Optimization using only part of a days data...

Date :12/11/2002 11:06:01 AM Poster : Dave Johnson

I am struggling to find a way to use a finite window of intraday data for pattern analysis, and then optimize in some way over a set of hundreds of days, just looking at the data within that window.

For example, using clusters or neural indicators, look at the first hour of trading only, and optimize for the end of day change after the window period, from the pattern of the first hour. As an input data set, one could take 5 min. bars over the first hour, and only look at this daily window for several years of data.

The indicators want to look at sequential data in the time compression of the chart, not just jump from one day to the next, only using one finite window (and perhaps this windows could be optimized in both length and position within the day).

I was convinced that this was simple to do within Neuroshell, but now am struggling to find the way. Am I missing something basic or straightforward?

With clusters, the look back would be sequential in the same time compression that the chart is in (it must be the smallest time step, I assume). How could one force the cluster indicator to only consider bars within the window, and ignore others?

Dave Johnson

Re: Trading Startegy Optimization using only part of a days data...

Date :12/11/2002 1:56:29 PM Poster : Steve Ward

I do this kind of thing a lot myself. Just add time rules to your strategy. Add time>10:30am to the entry rules (all must be true). Then add time=4pm to the exit rule (one must be true). Then you'll get in after your rules (cluster nets in your case) have looked at the first hour. You'll get out no later than 4pm. Technically, the optimizer is looking at all day, but in practice the clusters learn to only care about the first hour.

Steve, in this case would the "lookback" not still be limited? The optimization would only consider a defined time, but the bars are still there for lookback counts and also for "lag" when using the various lag indicators (lagclassify, etc.)

I would think that this would either limit the effectiveness of the optimization, or -- if lookback were massively increased to compensate (isn't this limited to 200?) would increase computer time.

I do this kind of thing a lot myself. Just add time rules to your strategy. Add time>10:30am to the entry rules (all must be true). Then add time=4pm to the exit rule (one must be true). Then you'll get in after your rules (cluster nets in your case) have looked at the first hour. You'll get out no later than 4pm. Technically, the optimizer is looking at all day, but in practice the clusters learn to only care about the first hour.

On 12/11/2002 11:06:01 AM Dave Johnson wrote:
I am struggling to find a way to use a finite window of intraday data for pattern analysis, and then optimize in some way over a set of hundreds of days, just looking at the data within that window.

For example, using clusters or neural indicators, look at the first hour of trading only, and optimize for the end of day change after the window period, from the pattern of the first hour. As an input data set, one could take 5 min. bars over the first hour, and only look at this daily window for several years of data.

The indicators want to look at sequential data in the time compression of the chart, not just jump from one day to the next, only using one finite window (and perhaps this windows could be optimized in both length and position within the day).

I was convinced that this was simple to do within Neuroshell, but now am struggling to find the way. Am I missing something basic or straightforward?

With clusters, the look back would be sequential in the same time compression that the chart is in (it must be the smallest time step, I assume). How could one force the cluster indicator to only consider bars within the window, and ignore others?

After reading your post a few more times, it sounds like you are saying that in no way do you want the indicators in your Cluster indicator to look back any more than an hour. I like my indicators to look back at the end of yesterday and the overnight gap, but if you don't, then yes, you'll have to place min/max optimization limits on the parameters so they don't go back more than an hour. Of course, in the first half hour, they'll still be looking back to yesterday, but since no trades can occur until after the first hour, the practical effect is that the only time period actually considered is after the first hour.

Steve, perhaps I am not describing the problem very well.

A cluster (for example) has a "scale" parameter, defined as:

From the help files: "Scale - the look-back moving window size (the number of recent bars on which to find the cluster center). We recommend between 20 and 200. The default value is 100."

If I am attempting to look use clusters to look at a snapshot of the first hour (for example) or even the last 30 min of the preceding day plus the first hour -- or whatever -- then the period of interest is only that window of time, for the indicators i have defined.

BUT...for optimisation, I am really only interested in the cluster indicator analysing that specific snapshot window, over a "lookback" of many hundreds of DAYS. In fact, if the chart is setup in 5 min or 15 min bars, the lookback ("scale") will be defined in 5 min or 15 min bars, not in days. There will therefore be many many useless bars, with a few useful bars in which the time is correct.

Your suggestion that the non-valid bars will be ignored, and therefore the optimization will work anyway, had not occurred to me.

Therefore, following with this assumption, the scale parameter can be set to (for example) approximately 5400 for an optimization of 15 min bars, which in reality only has approximately 200 valid first-hour snapshot bars. Then the hope is that the optimization will only be applied to the bars that meet this condition, and no Neuroshell confusion will result from the limited number of valid bars.

Will Neuroshell handle this large scale parameter without problems?

I've been trying the approach, but so far without great results (but I am not nearly finished with the trials). I've been using various market indices (advances divided by declines, both numbers and volume, block trades advances/declines, upticks/downticks, etc, in various normalized forms, for trading qqq's. Large values were used for scale as described above.

An alternative approach would be to create a data file, in which the parameters for the snapshot window were established as indicators associated with daily bars. For instance, advances divided by declines at the end of the first hour, upticks/downticks at the end of the first hour, etc. But this approach reduces the optimisation possibilities for the indicator parameters.

I thought you were talking about lookback in the indicators fed into the Cluster indicator. The lookback parameters used for scaling in the main indicators like Cluster should not be a concern for you. We only use that lookback to pick up a mean of previous values, so we can scale (normalize) the data values to a small range, like 0 to 1 or -1 to 1. We actually prefer only a few hundred bars, so the scaling changes as the data changes over time. But you can use 200 or 5400, I don't think it affects what you are trying to do. I've had good luck using Neural indicators, and to a lesser extent Cluster indicators, specifying that trades take place no sooner than 10am. Usually, I'll get one trade shortly after 10am that is 65% to 70% correct for that day. Often I'll specify an exit at 11am instead of waiting for 4pm, because I use e-minis which can move a lot $ wise in that time, and there's less chance a good call will get reversed in the afternoon.

The optimizer as I said will learn to ignore windows except the ones at or near 10am. But if you really, really, want to isolate bars with absolutely no chance the model will be affected by other bars, then purchase the NeuroShell Classifier and use the technique we described in the April 2002 newsletter to fire Classifier nets from Trader. You can use Trader indicators to get your data all set up properly. Sort them in Excel to get rid of unwanted data.

Actually, Dave, I spoke too quickly - Cluster indicators DO use the scale period to collect the cluster points as you pointed out, as well as scaling. It is the Neural Indicators which use the lookback ONLY for scaling. So use Neural Indicators instead of Cluster indicators, or limit the scale period for Cluster indicators while using 1 minute bars so there will be more of them. Sorry for leading you astray there.

Free Indicator: Adaptive Mass index

Date :12/11/2002 6:16:37 PM Poster : zawie

This is an indicator I've found particularly effective and I'm making available
to the forum for free. The package is a self-installing executable and includes
onboard help for Neuroshell.

The file referenced above can be downloaded using the following link:

AdaptiveMassIndexV10.exe

Adaptive Mass Index calculates an Adaptive version of Donald Dorsey's Mass Index. It dynamically adapts the length of underlying Mass Index on a bar by bar basis. If you combine this with an "Adaptor" that indicates trend, then you have a very powerful indicator that can become less responsive during a trend (so that you stay in the trade), and become more responsive when the trend begins to fail.

The Mass Index was designed to detect trend reversals by examining the range between the high and low prices. A larger Mass Index means a bigger range and conversely for a smaller Mass Index. A larger range which begins to rollover, frequently indicates a possible reversal.

Dorsey defines this action as a reversal bulge, and is defined by the Mass Index increasing above 27, and then returning below 26.5 on a daily graph. To mimic Dorsey's original definition use, Smoothing=9 and LowLimit=HighLimit=25 (i.e. non-Adaptive).

Dorsey explains that monitoring the daily range in this fashion can forecast market reversals that other indicators can miss.

This adaptive version of the mass index has the effect of making the underlying Mass Index more defined and extreme, so it can be used to produce a clearer picture of reversals.

Numeric Parameter Optimization

Date :12/13/2002 2:09:58 PM Poster : Rick D

This is probably a trivial question and perhaps answered elsewhere, but can anyone help me? I wish to do a Parameter Optimization where a single parameter appears in a number of calculations, and is always the same value across the calculations. For instance, I might want to optimize the value of n in the following indicator: n day moving average / n day standard deviation. I want to find the optimum value of n for a given purpose, but always maintain the same number of days in the moving average as are used for the standard deviation. Is this doable, if so, how?

Thanks in advance,
Rick D

Take a look at the tip on this web site called "Mapping Variables in Custom Indicators". That should be what you want.

This is straightforward Rick - create the indicatior then you have the option of saving the indicator - the save indicator wizard allows you to modify the indicator by specifying which variables are the same ie in your case n1 is the same as n1. Should you need in the future to have a relationship betwen n1 and n2 say n1 Without saving the indicator I don't think you'll be able to achieve your result.

If you look at the "Wish List" thread in this forum you'll see what is not yet possible in NSDT and what we dream about such as ensuring that n is the same not only in your indicator for say the long side but that n will have the same value for the short side in a trading strategy.

Sharpe Ratio

Date :12/17/2002 12:59:54 PM Poster : jk

Has anyone coded an indicator for trading system sharpe ratio ? Sharpe ratio really is for many traders (that I know) the defacto standard to discuss system performance. It is surprising it is not a standard feature in Nshell Trader.
Or if Sharpe Ratio is not widely used by Nshell traders to describe system performance what do most of you use ???

Thanks in advance-
jk

Re: Sharpe Ratio

Date :12/19/2002 7:13:01 AM Poster : chris wong

imo sharpe is a widely overrated and misunderstood statistic. it is not a litmus test for deciding to trade a trading strategy or not. it is a statistical measure used to compare two investment portfolios over a large number of periods. that begs several questions. is it valid to be used at all for a trading strategy for a single issue? if so, what investment portfolio should you compare to? a mutual fund? an index? another trading strategy? since it uses the standard deviation of differences between the funds, is it valid if your strategy is out of the market some of the time? what period should be used? how many periods should be used for statistical validity? should you rely on a single statistic to make your decision? what is a valid threshold to be applied given the sd question above?

Re: Sharpe Ratio

Date :12/21/2002 12:27:23 PM Poster : jk

I agree with your points however, Sharpe can not be ignored in my opinion (system to system on the same issue) . It is one of a few system perf. measures I use to determine if a system is tradable (max dd is another) . I do not believe there is 1 measure that answers all the questions (hence, the reason there are so many ways to optimize a system) however, sharpe is respected as a key one. As for the other questions period/time in market/threshold are all questions one must have some understanding of the statistics involved. Blindly getting a number that is not understood is a recipe for disaster (I think that is your point and I agree). With all that said I still like to use it as comparitive pulse on systems.
Eg. I will look at a system over several years and obtain monthly data for sharpe. If I get a number over 4, I look at the other perf. measures. If those pass my tests.....I trade it. However, I still look at sharpe first.
Anyway, I have been exporting Nshell system data to excel and wrote a little macro do get sharpe . Cumbersome, but it works.

Good luck-
JK

Re: Sharpe Ratio

Date :12/23/2002 8:07:43 AM Poster : chris wong

i can see comparing the same issue with two different systems as you describe. that will tell you which strategy is better. however, i don't see how such a comparison can tell you if one system or the other is tradable. imo you get a high reading if one is much better than the other even if both are bad. please elaborate if you think i am wrong.

On 12/21/2002 12:27:23 PM jk wrote:
I agree with your points however, Sharpe can not be ignored in my opinion (system to system on the same issue) . It is one of a few system perf. measures I use to determine if a system is tradable (max dd is another) . I do not believe there is 1 measure that answers all the questions (hence, the reason there are so many ways to optimize a system) however, sharpe is respected as a key one. As for the other questions period/time in market/threshold are all questions one must have some understanding of the statistics involved. Blindly getting a number that is not understood is a recipe for disaster (I think that is your point and I agree). With all that said I still like to use it as comparitive pulse on systems.
Eg. I will look at a system over several years and obtain monthly data for sharpe. If I get a number over 4, I look at the other perf. measures. If those pass my tests.....I trade it. However, I still look at sharpe first.
Anyway, I have been exporting Nshell system data to excel and wrote a little macro do get sharpe . Cumbersome, but it works.

Good luck-
JK

The Sharpe ratio is a standard feature of NeuroShell Professional as an objective function you can maximize on. It is not in the non-professional version, however, which may be why you do not see it.

Re: Sharpe Ratio

Date :12/17/2002 7:51:47 PM Poster : jk

Thanks for the prompt response.
However, while it is nice with the Pro version to maximize on Sharpe Ratio (as you detail) , I think it is still necessary to have an indicator (so one can change the period) detailing Sharpe ratio on ANY given system.

Simply stated- if a system is optimized for win-losers and one looks at the available performance statistics and thereafter optimized for roa and gets very similar performance statistics; one would assume the systems are pretty much equal. However, we both know they are surely NOT. Sharpe was created to help gauge this issue specifically.

Perhaps, some kind soul can just upload the indicator as it would be a pain to convert the Easylanguage Tradestation indicator.

Thanks thanks in advance.
JK

Next day open prediction?

Date :12/18/2002 1:34:56 AM Poster : Darek

Hi,
NST has many possibilities to create solutions of different problems ect., but has anybody built trading system (or nets) to predict very well next day open(price, especially of future contracts)? Could anybody give me an answer what solutions are the best? What is a precision and errors? What kind of inputs do you use?
I reach a conclusion that it's very difficult to predict accurately next day open price.
I'll be grateful for your hints.
Darek

Re: Next day open prediction?

Date :12/20/2002 3:56:02 PM Poster : Maxwell Craven

I had a fair degree of luck predicting the next day's open for SPY last year, at least for a while. Actually I predicted whether the next day open was up or down using the adaptive indicator plugin. I don't recall now exactly what I used as inputs to the adaptive nets, but it had to do with trading in the last hour of the day using 1 or 2 minute bars. I tried 5 minute bars but didn't do as well. If I find that chart I'll tell you what I did.

QFeed Symbol List

Date :12/18/2002 7:25:23 PM Poster : Dave Johnson

Below is a link to a compressed symbol list for qfeed.

It is not yet formatted for Neuroshell, but rather is of the format archived by Quote.com/Lycos.

The file is fairly large, and includes all symbol types (options, for example). I assume that this is a "maintained" file, which would be updated as symbols change. But I have not verified this with Quote.com/Lycos.

Selecting Issues

Date :12/19/2002 9:22:20 AM Poster : Doug B

I am trying to decide which EOD data supplier offers the best package to compliment the capabilities of NST. In an earlier messages Steve Ward and others have reinforced the need to pick the right issues for further analysis in NST. Having the ability to scan for issues exhibiting good cyclical patterns seems critical to the development of successful systems.

My thought is to develop scans based on, but not limited to, price range windows and cycle amplitude and frequency. Suppliers I have considered include MetaStock, CSI, QuotesPlus and TC2000.

Before signing up with another data supplier any recommendations would be appreciated.

Thank you,

feature request: mae

Date :12/23/2002 3:03:16 AM Poster : j ferguson

In the trade-by-trade analysis, it would be very useful to see the max intra-trade drawdown and max intra-trade profit for each trade (i.e. maximum adverse excursion, and maximum beneficial excursion).

This info would help greatly in determining stops (both loss and profit).

Regards,
J Fergsuon

NST and TradeStation, Pyramiding Contracts

Date :12/23/2002 4:58:49 PM Poster : Alan Gillies

Hi,
Wonder if anyone can help I have two questions-am failry new to using NST so apologies if they are basic.

1/ Can you use startegies developed in NST within TS 6.0 i.e. apply NST strategies to T Station charts.I have seen a couple of posts re this but if someone could give an idiots guide to how to do this if it is possible that would be great.

2/ HAving backtested a strategy which will increase or decrease contracts traded based on a starting miimum account size how do you then use the startegy to start from say tomorrow.

I have an E-mini strategy that I want to use but currently becasue of the backtesting it is trading 60+ contracts.
How do I go about using the optimised strategy but start again from a future date so that I can get the info on how many contracts to trade starting from say 1 contract on a $10,000 account size.

Apologies if these are really absic questions but still finding my feet

Alan

Re: NST and TradeStation, Pyramiding Contracts

Date :12/27/2002 4:02:18 PM Poster : Webmaster@ward.net

We aren't sure what you mean by "apply". You can move data to a TS chart from a NST chart, like buy sell signals, predictions, etc.. There are videos on that - look under the help menu under videos and view the ones in the TradeStation sections.

Trading strategies automatically start giving signals when new data is entered. However, if you want to view the statistics for the new data, you have to duplicate the strategy and change the start date (and number of contracts and other things if you want to.) There's a tip on this site showing how to accomplish that: Adjusting the Start Date of a Trading Strategy.

ToSteveWard: Suggestions for using PCA, Wavelets

Date :12/25/2002 9:50:41 PM Poster : Ng Tian Khean

Sometimes we just like to play around with NSTP and try all sorts of Indicators, prediction outputs, graphing and vizualization techniques etc
Steve, Principal Components Analysis and Wavelets are two of the Indicators in NSTP which look very interesting. How about you, or anybody here, posting suggestions on how we can make use of them.
I have a feeling if we can calculate these and Export and plot them in e.g. Matlab, we can gain great insight from the visualization of these multi-dimensional data sets.

Re: ToSteveWard: Suggestions for using PCA, Wavelets

Date :12/26/2002 5:29:30 PM Poster : Steve Ward

Well, those who don't have Matlab could also plot in Excel. I have never used any plotting other than that in NST, so by all means experiment and tell us what you find. PCA is a big subject and I might write a tip on the mathematical basis after the holidays are over. The wavelets I have had the most success with are the Redundant Haar wavelets in Advanced Indicator Set 2. The smoothed values look remarkably like Jurik adaptive moving averages (according to some of our users). But I use the Haar coeficient values in neural nets, usually neural indicators. However, my work in wavelets is limited so I'll let other users further respond. In any case, I think there is plenty of room for your research, because it is a vast field.

I have developed some very simple models that have done very well in sample and over the last year out of sample using the redundant haar coeffiecient. For SLB you might want to try this.

1. Create Indicator WSG Redundant Haar Coef (Close,1)
2. Use the Neural Outputs Indicator to create an Optimal 3 day Buy/Sell/Hold using the WSG Redundant HaarCoef (Close,1) instead of the default Close. (Line 1. Above)
3. Predict Target - 4 days ahead the Optimal 3 day Buy/Sell/Hold using the WSG Redundant HaarCoef (Close,1) Line 2. Above ...However Change the objective parameter to maximize the % Wins. Usually they will be about 73% correct in sample and out of sample.

Select the Input Selection Parameter to Optimize.

Inputs: 0-5 day lags of Line 1 Indicator and Line 2 Indicator

Training set used to build prediction model:
Maximum training set size = 5 Years
Minimum training set size = 3 Months

Walk-forward testing to evaluate past out of sample prediction performance:
Number of walk-forward tests = 1 walk-forward test
Size of the walk-forward tests = 1 Year
Number of optimal walk-forwards = Optimize on training set

Training objective used to select optimal network structure and optimal inputs/parameters:
Objective = Maximize % Correct Sign
Trading Positions = (No Trading Positions)
Training parameters
Maximum number of hidden neurons during training = 10

Optimization parameters
Number of hidden neurons during optimization = 10

Maximum number of inputs = 10

Then Apply the Out of sample results to the Trading Solution Using the following rules:

Long If Out of Sample>0, Short if Out of Sample <0

For SLB the Out of Sample Performance period 12/27/01 to 1/02/02 was 80.4%
84 Trades 56 Wins 27 Loosers.

It also works well on SPY Last year but only 23%, 72 Trades 45 Wins 26 Loosers

Wish List: prediction wizard training/evaluation set date ranges

Date :1/6/2003 12:37:03 AM Poster : Peter Chen

I am a new user and wonder if the following has been suggested or there are ways to work around this (or there are good reasons for not implementing it) ..

Currently the training set and the evaluation set for the prediction wizard can only be specified in terms of set sizes (e. g., numbers of years/months), not date ranges. This approach makes it necessary for a user to make sure the chart has the correct range of data loaded before he creates a new prediction. This is different from the trading strategy wizard which allows a user to specify any date ranges. I would like to have this date range flexibility for the prediction wizard too.

Neural Indicators vs. Cluster Indicators

Date :1/6/2003 11:19:58 AM Poster : John Gotwals

I have had moderate success with the cluster indicators, but zero success with the neural indicators. I am using these indicators with the strategy wizard set for 5 minute bars, and am modeling NYSE stocks. I use mostly momentum related indicators as inputs to the neural and cluster indicators, and normally optimize over 3-4 weeks worth of 5 min bars.

I would greatly appreciate any comments you might have about these two sets of indicators.

Filtering out crossings

Date :1/6/2003 1:25:26 PM Poster : Siasb

I would like to filter out crossings above and below between two indicators that are say N bars away from each other. Is there an easy way to describe that? Thanks in advance for any info on this.

Re: Filtering out crossings

Date :1/6/2003 4:33:09 PM Poster : Xprogrammer

Are you saying you want signals for the crossings except when the two indicators are within N bars of each other?

On 1/6/2003 1:25:26 PM Siasb wrote:

Re: Filtering out crossings

Date :1/7/2003 10:24:13 PM Poster : Siasb

It would have been nice If we could have attached .jpg or .jif files to the messages to illustrate the point of discussion; However, I will give it a try :)

For example: Take MACD and MACD-signal (standard parameters) for any given symbol. The two could cross above or below each other through time. What I would like to filter out are times that these two cross each other back and forth in some segment of bars (When the crossing are to close to each other bar wise). One way to do that is to make one much slower than other, but it's not really what I want. I could consider the proximity of the indicators to each other and then go by that, and that's what I am currently trying. But as I am new to the NeuroShell, I have not found the right set of funcionalities. I also have the fuzzy indicator and might be able to use it as it provides relative measure, but not sure how yet I can use that either. Thanks in advance for any hints.

Re: Filtering out crossings

Date :1/9/2003 9:12:15 AM Poster : Xprogrammer

You could use the selective sum indicator to add up the number of crossovers in the last N bars. However, it seems to me counting crossovers has a problem. You can't generate a signal if there were no crossovers in the last N bars, because there may be crossovers in the NEXT N bars. That is to say you may be at the beginning of a segment, and you won't find out until its too late to trade! So I think your own idea of measuring how far the crossover goes (proximity) is the right way to approach the problem.

It would have been nice If we could have attached .jpg or .jif files to the messages to illustrate the point of discussion; However, I will give it a try :)

For example: Take MACD and MACD-signal (standard parameters) for any given symbol. The two could cross above or below each other through time. What I would like to filter out are times that these two cross each other back and forth in some segment of bars (When the crossing are to close to each other bar wise). One way to do that is to make one much slower than other, but it's not really what I want. I could consider the proximity of the indicators to each other and then go by that, and that's what I am currently trying. But as I am new to the NeuroShell, I have not found the right set of funcionalities. I also have the fuzzy indicator and might be able to use it as it provides relative measure, but not sure how yet I can use that either. Thanks in advance for any hints.

On 1/6/2003 4:33:09 PM Xprogrammer wrote:
Are you saying you want signals for the crossings except when the two indicators are within N bars of each other?

On 1/6/2003 1:25:26 PM Siasb wrote:
I would like to filter out crossings above and below between two indicators that are say N bars away from each other. Is there an easy way to describe that? Thanks in advance for any info on this.

Any unwanted NS Trader Professional Keys ?

Date :1/6/2003 4:53:48 PM Poster : Rob Lenzie

I'm doing some analysis and getting some interesting results but would like to do more. Is there anyone out there with a NS Trader Professional key they would like to sell ?

Webmaster note - if anyone wants to sell to Rob send the offer in email to sales@wardsystems.com and we will forward to Rob.

Re: Any unwanted NS Trader Professional Keys ?

Date :1/6/2003 5:14:36 PM Poster : Webmaster@ward.net

Don't take any offers over $697.50, because we now discount second and subsequent copies at 50% to the same user!

Display Order of Custom Indicators

Date :1/9/2003 3:15:12 PM Poster : Rick D

Hopefully, a simple housekeeping question. I have created a large number of custom indicators. When I diplay a list of all the indicators I have created (Insert / New Indicator / MyCustomIndicators) they appear to be displayed in the order in which I created them. Is there any way for me to change the order in which they are displayed (alphabetical, logical groupings, etc.)?

Thanks in advance.

Re: Display Order of Custom Indicators

Date :1/9/2003 4:33:27 PM Poster : Maxwell Craven

As far as logical groups go, you don't have to store them all in "Custom Indicators" You can choose your own categories. I have quite a few categories. That may eliminate your problem right there.

On 1/9/2003 3:15:12 PM Rick D wrote:

Wish list and release 4.0

Date :1/10/2003 10:05:14 AM Poster : Steve Ward

We have started letting some alpha testers test 4.0. Some of the wish list features are in it and some are not. Since release 4.0 was already substantially programmed when the wish list started, we were not able to add more features without delaying this important release even more. So the wish list features that made it to 4.0 were those we already had programmed.

However, I want all of you who took the time to give us your thoughts to be assured that we will not just toss the wish list aside with 4.0. Many of your desires will make it into future releases, which hopefully will not be as long in coming as 4.0 was.

Re: Wish list and release 4.0

Date :2/6/2003 10:24:14 AM Poster : Marco Calzolari

Any more info about the release schedule and about the new features?
(by the way, I am longing to be able to trade European markets with E-Signal)
Will the price list remain unchanged? And will I still be entitled to a free upgrade if I buy a new Daytrader license now?

On 1/10/2003 10:05:14 AM Steve Ward wrote:

Re: Wish list and release 4.0

Date :2/6/2003 1:11:49 PM Poster : Webmaster@ward.net

We have not set a release date yet. There are no plans for any price increases, so unless that changes you should be able to get a free upgrade. Now would be a great time for anyone to upgrade due to the Valentine sale - we rarely have discounts that big. Below is a partial list of new features, the ones we have made public so far:

1. An intraday interface to Esignal
2. A "data pump" which will allow you to feed intraday data NeuroShell programmatically
3. The ability to optimize one model for all chart pages (i.e., the same model for all issues in the chart)
4. A new charting interface with the ability to size subcharts
5. Menu item to email charts and data
6. The ability to minimize the Trader while processing
7. Autosaving of chart before optimizing or training (crash protection of chart)
8. Save prediction/strategies for use in other charts
9. The ability to retrieve overnight sessions from Quote.com
10. Trading Portfolio Status (i.e. open trades/filled trades/closing trades...)
11. Trade Prompting (i.e. Message box stating that you need to place an order for X shares of IBM)
12. Ability to create ticker symbols that are simple combinations of ticker prices and use the combination symbol as the primary data series. The optimizations and trading strategies will be based on the ticker symbol combination and results determined on the calculation, not a single ticker symbol. For instance a ticker symbol combination might be [5*YHOO - 2.5*INTC + 3*MSFT], which would result in a price stream on the chart that is 5*YHOO's price minus 2.5*INTC's price plus 3*MSFT's price.
13. Optimization timeout - timer in the Trader so that the Optimization process could be stopped after x minutes, instead of running until no better solution found.
14. Option to stop optimization/save results when out of sample results are best
15. TradeStation intraday chart data transfer

Predicting Market Indexes

Date :1/10/2003 8:47:39 PM Poster : Ng Tian Khean

Predicting Market Indexes seems an impossible task (otherwise we would all be billionaires). But are there ways using NSTP to at least gauge the strength of the market, or give some sort of indicator or probabilities. The reason I am asking is, if even if we cannot predict how much the market will go up/down, if we at least know it's probable direction or increase/decrease in volatility, we can select stocks based on their Beta.

I am a novie, and hope some people can suggest an approach to this task. Thanks

Re: Predicting Market Indexes

Date :1/13/2003 2:26:40 PM Poster : Xprogrammer

I asked Ward that very question a while back and they pointed me to the tip about confidence factors. Since then I've been using neural indicators for that purpose. Since I also own the NeuroShell Classifier, I use nets from that in NST as well. It gives really good probabilities.

Forcing exit at end-of-day

Date :1/11/2003 4:53:29 PM Poster : John Gotwals

There has been a fair amount of discussion in this forum, and several tips such as Reversal Trading Strategies and Forcing the Trader to Trade Only Once Per Day in an Intraday Chart about exit at EOD. Below I will describe what I want to do.

I would like to do reversal trading (going long to short and vice versa), and close my trading position just prior to the market close. In many days I would expect to have more than one trade, but the actual number is unknown and may be zero. I also would like to keep optimization times under control, and therefore I do not want to duplicate my exit conditions with the same set of controls I am using in the entry conditions.

Is there a solution to my problem which will not add greatly to optimization time?

Re: Forcing exit at end-of-day

Date :1/14/2003 4:50:47 PM Poster : Maxwell Craven

Did you try just putting time=3:45pm into your exit conditions?

On 1/11/2003 4:53:29 PM John Gotwals wrote:

The problem is that as soon as you put an entry in an exit conditon, then you can no longer use the "stay in the market" mode of operation.

On 1/14/2003 4:50:47 PM Maxwell Craven wrote:

Long and short interest

Date :1/16/2003 9:37:34 AM Poster : Xprogrammer

Do any of you expert traders out there know where I can get statistics on the number of longs outstanding vs the number of shorts outstanding, either on an equity or a futures contract? It seems like that would be very good info to have.

Re: Long and short interest

Date :1/16/2003 10:10:15 AM Poster : Steve

For long and short interest on a futures contract, you can look at open interest. Remember, for every futures contract there has to be someone on each side. Every long has a short.

On 1/16/2003 9:37:34 AM Xprogrammer wrote:

You can find short interest numbers for US equities on Bloomberg, I do not know of cheaper sources (at least for historical data). The long interest for equities IMHO should be simply the number of shares outstanding.
About futures, long and short positions are both equal to the open interest number. It is more qualifying to know who is long and who is long, a good source is the weekly COT (Commitment of traders) that you can find several web sites using a good search engine. The data must be normalized because commercials/istitutionals are always short, having to hedge cash positions. A normalized COT chart is available for CSI-Unfair Advantage customers, I find it interesting (small traders are always short on market bottoms) but unfortunately the update is usually late 1 to 2 weeks.

Suitable hardware for NeuroShell DayTrader?

Date :1/24/2003 9:16:56 AM Poster : Rolf Edberg

Hi

I want to buy a new PC to run NeuroShell DayTrader on.

My question is what is the most important part? Or does it has to be everything?

Is it the frequency(3.0 or more)? Dual-CPU:s? The harddrive(SCSI)? Or else...?

Thanks

Rolf

Re: Suitable hardware for NeuroShell DayTrader?

Date :1/28/2003 10:19:13 AM Poster : John Gotwals

My answer is based on 6-months experience with NeuroShell DayTrader Professional. There are only two things that count. Processing power and memory.

In my case my existing machine just happened to have two processors, and that does allow me to get twice the throughput when I run at least two instances of NeuroShell. I would say that 500 MB of memory is more than enough. The problem with two processors is that the machines cost more than twice as much as single processor machines! Some of this may be related to the use of Intel's Xeon processor for two CPU systems. In my system each Xeon processor has 512 KB of level 2 cache, and probably the amount of level 2 cache is important too.

BTW, my system is at least three years old, the clock frequency is only 500 MHz, and the system bus frequency is only 100 MHz. I want to update soon, and I am still debating the dual-processor issue.

Re: Suitable hardware for NeuroShell DayTrader?

Date :1/29/2003 9:35:33 PM Poster : fhealy

Regarding the amount of memory needed, I would like to add that you may actually need more than 500 MB. When you find a trading strategy that you really like, you may want to add additional stocks to the strategy by adding chart pages. I have one trading strategy with twelve stock charts that uses 512 MB by itself to run. If you want to run more than one strategy at the same time, you can easily eat up close to 1 GB of memory, which is what I use on my system.

Multiple time frame indicators

Date :1/27/2003 10:01:54 AM Poster : Steve Ward

For those of you who have been wishing NeuroShell Trader had the ability to do different size bars than the standard ones we offer, there is now a great solution. Steve Buss (who posts on this forum as Steve from California) has developed Multiple Time Frame Indicators, which let you have 3 minute bars, or 7 minute bars, etc. His company is Emmetropia. To read all about them go here:

http://www.neuroshell.com/addons.asp?mti

Re: Multiple time frame indicators

Date :2/6/2003 9:16:24 PM Poster : Jimmy Raineri

Since we have the Esignal feed in release 4, any chances of getting NSDTP the ability to use cummulative tick based charts and getting away from time based charts all together? There really is a significant edge to be gained using cummulative tick charts.

Certainly once 4.0 is out we'll be looking for what to do next. I wonder if there should be revoting on the wish list in view of some of it becoming available with 4.0? To refresh your memory, here are the major features of 4.0 that we have made public:

1. An intraday interface to Esignal
2. A "data pump" which will allow you to feed intraday data NeuroShell programmatically
3. The ability to optimize one model for all chart pages (i.e., the same model for all issues in the chart)
4. A new charting interface with the ability to size subcharts
5. Menu item to email charts and data
6. The ability to minimize the Trader while processing
7. Autosaving of chart before optimizing or training (crash protection of chart)
8. Save prediction/strategies for use in other charts
9. The ability to retrieve overnight sessions from Quote.com
10. Trading Portfolio Status (i.e. open trades/filled trades/closing trades...)
11. Trade Prompting (i.e. Message box stating that you need to place an order for X shares of IBM)
12. Ability to create ticker symbols that are simple combinations of ticker prices and use the combination symbol as the primary data series. The optimizations and trading strategies will be based on the ticker symbol combination and results determined on the calculation, not a single ticker symbol. For instance a ticker symbol combination might be [5*YHOO - 2.5*INTC + 3*MSFT], which would result in a price stream on the chart that is 5*YHOO's price minus 2.5*INTC's price plus 3*MSFT's price.
13. Optimization timeout - timer in the Trader so that the Optimization process could be stopped after x minutes, instead of running until no better solution found.
14. Option to stop optimization/save results when out of sample results are best
15. TradeStation intraday chart data transfer

Reccomend!-> Multiple time frame indicators

Date :5/24/2003 7:25:18 PM Poster : John Ferguson

I've had the MTI addon for awhile now. It's very useful.. I've had luck with using higher-timeframe bollinger band (when in a trading range in that higher timeframe) violations in a lower chart.. e.g., 5-min bar reversals above the 1-hour bb upper band when the 1-hour bb-high and low are flat. (this can be a great way to 'cherry-pick' range-bound trading zones)

Another area I'm investigating is the intersection of indicators (bb%, rsi, etc) between timeframes, although there are so many possibilities its kind of overwhelming.

Has anyone else been using these?

Regards,

John F.

Reducing Whipsaws

Date :2/3/2003 8:35:23 PM Poster : John Leonard

I am a new user of NST Daytrader Professional and would greatly appreciate help with the following: I am trying to find a way to reduce the non-trending whipsaws when using Wilder's Parabolic. It seems to me that if I could add "X" to the buys and subtract "Y" from the sells to an extent that would miss most of the whipsaws but allow meaningful participation in the trends, my overall profit would improve significantly. I need help with the construction of a device that would accomplish this.

Trader or Daytrader?

Date :2/4/2003 4:26:11 PM Poster : Elliot Turner

I'm curious as to the percentage breakdown of Neuroshell users that are using the Daytrader software versus the Trader Pro package.

Have the users on this board had more success predicting stock behavior on an intra-day or EOD basis?

Regards

Re: Trader or Daytrader?

Date :2/5/2003 3:02:43 PM Poster : Webmaster@ward.net

We sell slightly more Trader Pros than DayTrader Pros. However, many of those upgrade within 6 months of purchase to DayTrader Pros. That leaves slightly more DayTrader Pro users, very roughly:

Trader 5%
Trader Pro 45%
DayTrader Pro 50%

Re: Trader or Daytrader?

Date :2/6/2003 9:34:54 AM Poster : Maxwell Craven

I'm one of the ones who upgraded, and yes, I'm doing much better with NSDTP. I upgraded after Steve Ward convinced me that I could get more relevant data with smaller bars (I use half hour bars now), but I don't think that's why I'm doing better. I believe it has more to do with catching the intraday swings instead of trying to predict the longer term trends.

Maxwell,

I'm curious on your success in trading longer term swings since I focus on mutual funds. My day job prevents me from being a daytrader type and I don't think I would want to be too attached to the computer.

What was your success rate predicting the longer term and what instruments did you predict for? Did you try the major indices? Do you use the day traders to improve your entry and exit of multiday trades?

On 2/6/2003 9:34:54 AM Maxwell Craven wrote:
I'm one of the ones who upgraded, and yes, I'm doing much better with NSDTP. I upgraded after Steve Ward convinced me that I could get more relevant data with smaller bars (I use half hour bars now), but I don't think that's why I'm doing better. I believe it has more to do with catching the intraday swings instead of trying to predict the longer term trends.

Yes, I trade indexes and futures, but generally I'm out by the end of the day. Strange thing though - I do have a couple of studies on 5 minute charts that I intended to trade at least once a day, but the signals accidently turned out to be much longer term. I haven't traded them yet but I've been following them and they have been mostly right so far. I'm thinking about trading one.

Regarding improving entry and exit timing for multiday trades, I may not need that since these trades last several weeks but I can see where it might be helpful if you trade a couple of times a week. I think being able to make studies with less data will be more important to me even longer term.

Re: Trader or Daytrader?

Date :4/30/2003 8:33:04 PM Poster : Walter

Maxwell,

Thank you for responding to my queries on Trader vs Daytrader. I have a couple of follow-on questions, if I may.

You mention you have a couple of 5 min. studies which produce signals valid over weeks. How "accurate" are they? Could you see the Trader Professional alone, working on End of Day data, capturing these signals? How sensitive do you think these signals are to the size of your time interval?

You mention only a "couple" of signals. Does this mean you have many more effective signals valid only for intraday?

You mention studies using less data will be more important to you longer term. Do you mean that over the long term, you plan to go back to using End of Day data only and not daytrade? Or using fewer data points to capture your long term signals? Because training time is reduced? Because the signals are more effective?

Thanks again, Maxwell, for putting up with my pestering questions, but your insights are greatly appreciated.

Re: Trader or Daytrader?

Date :5/4/2003 11:46:13 AM Poster : Maxwell Craven

No, Walter, I don't plan on going back to trading on daily bars, even if I don't trade during the day. To me the daily bars just aren't capturing the movements that are going on, and you just don't get a picture of the market dynamics. For example, the daily change might show a 2 point gain. You think, well, slow day. Then you look at the 5 minute bars or the half hour bars and you see the market went shooting up all morning, then started dropping rapidly in the afternoon and sank just above open. Not a slow day at all. Daily bars are like a big filter that you might want for trading a couple of times a year, but not if you want to make trading decisions a couple of times a month. You miss out on all the cycles. In addition to that you tend to think about placing trades at the market open, which to me is the absolute worst time. When you get used to looking at intraday prices you start thinking about limit orders during the day, even if you are at work and not watching when it happens.

The other issue that I can't take credit for figuring out myself because Ward pointed it out is that I don't have to train nets or optimize on 2 to 4 years of data as I would with daily bars. I only need a couple of months, and even less with 5 minute bars. No, it isn't a training time issue, but a relevancy issue. Yes, the signals are more effective.

Export Intraday predictions to TradeStation TS6

Date :2/4/2003 5:11:15 PM Poster : Rick D

Hi,

Perhaps this is answered elsewhere, but I can't seem to find it if it is. I would like to create an intraday prediction using NeuroShell Daytrader, and then export the prediction in real time at the end of each bar to TradeStation TS6 (and soon to be TS7). I would then use this prediciton in TradeStation Easy Language as part of an automated trading strategy. Can this be done, and if so, how?

Thanks in advance,
Rick

Re: Export Intraday predictions to TradeStation TS6

Date :2/21/2003 9:29:52 AM Poster : Webmaster@ward.net

The new release 4.0 will be able to do this for you. You can also go the other way - from TradeStation to NeuroShell.

Portfolio Analysis
Date :2/10/2003 10:34:58 AM Poster : Alan Gillies

Is it possible to pull together a number of different strategies and commodities or stocks and anlayse the data for that group as a portfolio.I know you can analyse a number of different charts using the same strategy but not sure how to bundle together different strategies into a portfolio analysis- for example X and strategy A with Y andstrategy B with Z and strategy C etc.Is it possible to do this and get statistics on how the portfolio performed?

Thanks

Alan

Re: Portfolio Analysis
Date :2/21/2003 9:28:04 AM Poster : Webmaster@ward.net

You could probably program something like that if you own the Data Exchange addon. You could send all the information from each chart over to your Visual Basic program that could print a report for you.

Cookies are probably not the best idea as many users log in with numerous serial numbers for the different products they own. If the site was setup so that a login and password for each user granted them access to the areas of the product that they owned, then cookies would probably work.

A better suggestion would be to use the AutoComplete feature of Internet Explorer.

Don't assume everyone is using IE or wants the autofill turned on.

What percent of people login with multiple serial numbers? Does that give them different access? If not, they why are they logging in with different serial numbers? Are you preventing adding this because of a few users? You COULD have a check box to disable that autofill in feature. I'm guessing the vast majority would use it. You could even track how many people are using it to see if it's something to change/modify.

This forum also needs an escape. One generally accepted standard for web pages is ALWAYS give the user a way to get out. How can I get back to the page you are directed to after you login? If you had a "home" link, it would be.

Also put your branding/contact information on EVERY page on your site.

I tried submitting this but it said I needed to login with a valid serial number. Good thing I copied this to the clipboard first. I'm guessing you're setting session variables that are timing out too fast (5 min)?

Tom

>Don't assume everyone is using IE or wants the autofill turned on.

We don't assume that everyone is using IE or wants the autofill turned on. We were merely suggesting that if they are using IE, that the autofill feature would work nicely. Perhaps there are similar features in Netscape or another browser.

>What percent of people login with multiple serial numbers?

There is a large percentage of users who have multiple products (like yourself), giving them multiple serial numbers.

>Does that give them different access? If not, they why are they logging in with different serial numbers?

Yes, each product serial number gives different access. A Trader serial number only shows material related to the Trader, while a GeneHunter serial number only shows material related to GeneHunter.

>Are you preventing adding this because of a few users?

As we said before, there are a large percentage of ward.net users who have multiple products. Some users have all or almost all of the products that we own.

>You COULD have a check box to disable that autofill in feature. I'm guessing the vast majority would use it. You could even track how >many people are using it to see if it's something to change/modify.

The autofill feature is part of IE. We don't automatically enable/disable that, and in fact, we are not even sure if it is programatically possible via a web page.

>This forum also needs an escape. One generally accepted standard for web pages is ALWAYS give the user a way to get out. How can >I get back to the page you are directed to after you login? If you had a "home" link, it would be.

This is a good suggestion. We will try to implement it. In the meantime, you can always use the back button in your browser.

>Also put your branding/contact information on EVERY page on your site.

Again, a good suggestion.

>I tried submitting this but it said I needed to login with a valid serial number. Good thing I copied this to the clipboard first. I'm guessing >you're setting session variables that are timing out too fast (5 min)?

We will double check to see if it is too fast. About how long do you think your session was open?

We will be sure to pass your concerns on to our Internet Development team.

On 2/16/2003 3:25:17 AM Tom Nunamaker wrote:

Intraday NSDTP predictions and strategies

Date :2/10/2003 9:59:12 PM Poster : Ralph

My testing seems to be more productive using intraday bars in a 4 month time period rather than daily bars in various time periods. I still do not trust this whipsaw market enough to use real dollars to test myself but I like NSDTP. Marge and Steve are a class act.

DDE direct into NeuroShell DayTrader Pro?

Date :2/14/2003 8:57:44 AM Poster : Rolf Edberg

Is it possible to use a DDE-link that comes from my Quote-supplier into NeuroShell DayTrader Pro as a live Data source?

Or do I have M3?

Or is it possible to use Excel with a loop (then Excel sums the trades to 1-minutes quotes)?

Any suggestions?

Regards

Rolf Edberg

Re: DDE direct into NeuroShell DayTrader Pro?

Date :2/21/2003 9:24:18 AM Poster : Webmaster@ward.net

The new data pump in release 4.0 might be able to do what you want. M3 is not a good bet because we haven't had any cooperation from those folks in getting their new version to work with 3.8. We may in fact drop M3 in release 4.0 unless that situation improves.

On 2/14/2003 8:57:44 AM Rolf Edberg wrote:

The Alpha testing is officially closed for new participants. However, since few of those participants are actively testing the Data Pump, there is a real good chance we'd let you in anyway if you email us and tell us what you plan on doing with it! Send the email to support@wardsystems.com.

Indicator 1 Flag To Indicator 2 Value Intersection Indicator

Date :2/14/2003 10:57:23 AM Poster : Steve in California

Sometimes it's useful to be able to visually examine the intersection of "flag value" indicators overlaid on some other indicator. To do this requires lots of mouse pushing and clicks.

Here's a dll, a tpl file, and an illustrative chart for providing this kind of view more simply:

Indicator 1 Flag to Indicator 2 Value X.zip

I use it to show where pivots occur precisely on indicators like those found in the Price Momentum category.

Please note that, as I understand it, this indicator has NO usefulness in optimization processing. It just helps me to see and understand relationships across indicators better.

Jurik's CFB DLL

Date :2/19/2003 5:39:04 PM Poster : John Gotwals

I am interested in comments about Jurik's CFB indicator which purports to reveal the market's trending time frame. I have the CFB DLL module, and when I plot its output (using 5-minute bars) and compare it with the time series it is evaluating, I can not seem to make sense of CFB's output. I have experimented with different iSmooth and iSpanSize values and still conclude that the output does not seem to be correlated with the input.

Is anyone using CFB in a successful trading system?

Re: Jurik's CFB DLL

Date :2/21/2003 7:44:12 AM Poster : Greg Kramer

I use CFB. I find that it works as specified. Its output increases in value as the trend (either up or down) increases in duration. You can verify this by looking for peaks in CFB and then seeing if you can visually draw a trendline (either up or down) in the price data backwards in time from that peak. It can be used as a trend detection indicator, but I found others that are more useful for this purpose.

However, CFB's output really should be used as an input to another indicator, which you can not do in NST unless you write a DLL to do it. I recommend that you look at Bowfort Technologies' Z Jurik indicators (posted here in this forum). From their help file: "Z CFB is very useful as an adaptor in the adaptive indicators: Z Adaptive JMA, Z Adaptive RSX and Z Adaptive VEL."

Re: Jurik's CFB DLL

Date :5/28/2003 10:16:03 AM Poster : Bertrand

That is the clue of CFB,

it is not highly correlated with the basic time series it is analyzing, therefore a very good input to a NN. You could use CFB as an adaptor to other indicators & for timely exits when a established trend breaks down. Still another use is position sizing & risk management (leverages,exposure).

Something more practical for realtime use: Trade when CFB is rising, this well help you in increased trade efficiency & average trade profit!

My best regards
Bertrand

CFB does wonders for an MA crossover system.. Start by using the 40 period MA of cfb, and only taking ma crossover trades when cfb is above that average.

Then put bollinger bands around cfb, and see if a way to 'pile-on' or pyramid successfully doesn't jump out at you. All of the bollinger band phenomena (squeeze, relative 'w' bottoms and tops, etc) happen with cfb as well as price.

I've also found that %bandwidth can be a better filter for some stocks than%b or cfb's relation to its MA.

Anyway, I hope that's helpful.

Best Regards,

John Ferguson

Normalizing Inputs for intermarket nets

Date :2/25/2003 1:18:26 PM Poster : Dave Hubbard at Midwest

I have run some nets using inputs that I know have an effect on what I am trying to predict. It seems that I sometimes run into a brick wall with respect as to how I should normalize the inputs. For instance, I will try using percent change in some stocks to predict the percent change in close of another stock or index. (This is just one example) It seems that I end up with something good only once in a while yet I know from my previous trading experience that these markets do have an effect on the market i am trying to predict. I have had similar problems with the neural indicators with respect to intermarket nets. I just wonder, might I be trying to predict the wrong output or might I need to normalize my inputs differently? Any hints or ideas would be appreciated!

Re: Normalizing Inputs for intermarket nets

Date :2/25/2003 4:26:09 PM Poster : Texas Bubba

Try usin the percent spread or releative strenth between them two stocks. Then I doubt ya have to do any normalizin.

Re: Normalizing Inputs for intermarket nets

Date :3/18/2003 1:57:20 PM Poster : Maciej

I too have found difficulties in normalizing data so that they give good results.

In my case I tried to make the neural network learn about and recognise two bar reversals. My idea of normalizing was to use ratios of all the rules so that for instance the rule "first bar opens near the the low" would be a ratio of open divided by the low and so on for all my other rules. The idea that I had was that the network would recognise the interesting combinations of the various ratios for each of my rules so that it could predict well and of course not be tied to one stock or in my case the Dow. This approach has been unsuccesful probably because I rendered the exercise too complex. I'm looking at clustering the ratios somehow as that may make the problem more solvable. Like you with your indicators, I know that these two bar reversals can work and when visually used these bars are useful. I seem to have read in this forum that nets are good on simple problems.

Perhaps the forum webmaster can point both of us in the right direction.

Re: Normalizing Inputs for intermarket nets

Date :7/4/2003 2:01:18 AM Poster : Martey Newman

Dave,

It seems to me that you are using an intermarket analysis approach. I suggest you try the following.

You may already own this book, but try to get hold of it if you can: Neural Networks for Financial Forecasting, By E Gately.

Try this masters solution I found on web:
DATASET DESCRIPTION
This study implements the model on the stock market indexes from 10 countries. The test dataset are daily forecasts of the closed indexes from 09/04/2000 to present. The training datasets consist of historical daily data from each of the individual market indexes. For the modeling, each single data variable will be provided as input to an individual GRNN model. The input variables used to forecast each index are included below:

· High of the index

· Low of the index

· Close of the index

· One-day lag of the closed index

· One-week lag of the closed index

· Closed/current index from the other 9 markets

The individual models are training on the aforementioned data for each of the following countries (and corresponding stock indexes):

Table 1: Countries with Stock Market Names and Time Zones

Country
Index Name
Time Zone

Australia All Ordinaries GMT+10:00
Brazil
Bovespa
GMT-03:00

Germany
DAX
GMT+01:00

Japan
Nikkei 225
GMT+09:00

USA
S&P 500
GMT-05:00

Singapore
Straits Times
GMT+08:00

Thailand
SET
GMT+07:00

Turkey
ISE National-100
GMT+02:00

UK
FTSE 100
GMT

S-Africa
Johannesburg All Share
GMT+02:00

For simplicity, the 10 markets in the study were grouped by time zone as follows:

Table 2: Countries Grouped by Time Zone

Group I
Group II
Group III

Australia

Japan

Singapore

Thailand
UK

Germany

Turkey

South Africa
USA

Brazil

Group I:

To forecast the indexes for day d in Group I, the input consists of:

· Indexes of all ten markets on day d-1

Group II:

To forecast the indexes for day d in Group II, the input consists of:

· Indexes of markets in Group II and III on day d-1

· Current indexes* of markets in Group I by the time the markets in Group II open on day d

Group III:

To forecast the indexes for day d in Group III, the input consists of:

· Indexes of markets in Group I on day d

· Current indexes* of markets in Group II by the time the markets in Group III open on day d

· Indexes of the markets in Group III on day d-1

*Note: in case of the unavailability of real-time data, the closed indexes on day d will be used.

For one country forecast, the neural network is trained with the time lagged historical data for 700 days of those aforementioned variables. The next day forecast is then made. For the next forecast the network will be re-trained using the time lagged historical data for the previous 700 days. The reason of using this data range results from the unavailability of data in some countries. The sliding window of days in the forecasting is shown in the figure 1.

Figure 1. Lagged Historical Data Used in the Forecasting

All market index data, used in this study, are downloaded from the http://finance.yahoo.com website in Excel Comma Separated Values (.csv) file formats. They are then preprocessed, arranged, and saved in Excel spreadsheet (.xls) format.

Dataset is the value of the stock market indexes. The simulations are designed to forecast the close of each index based on other index values that may or may not currently be closed. Therefore, due to the time zone difference, the variables are chosen based on the current time of each market. For example, to forecast the closed S&P 500 index on June 13th (Thursday), the 14 input variables will be:

1. S&P 500 high index on June 12

2. S&P 500 low index on June 12

3. S&P 500 closed index on June 12

4. S&P 500 closed index on June 11

5. S&P 500 closed index on June 6 (last Thursday)

6. Closed index from Australia on June 13

7. Closed index from Brazil on June 12

8. Current index from Germany on June 13 (by the time US market opens)

9. Closed index from Japan on June 13

10. Closed index from Singapore on June 13

11. Closed index from Thailand on June 13

12. Current index from Turkey on June 13 (by the time US market opens)

13. Current index from UK on June 13 (by the time US market open)

14. Current index from South Africa on June 13 (by the time US market opens)

Good luck

Is Xeon better than P4 for NST?
Date :2/25/2003 1:46:53 PM Poster : Rolf Edberg
Does NST use the extra stuff inside the Xeon-CPU or is it better to chose P4 with a higher freqency?

Re: Is Xeon better than P4 for NST?
Date :2/26/2003 10:51:25 AM Poster : Webmaster@ward.net
Some of the Xeon improvements wouldn't be applicable, like the integer arithmetic and I/O improvements. Others like hyperthreading might be if you had multiple processors. However, NeuroShell does not presently contain any special coding for these new processing capabilities. The newest P4s have hyperthreading too, we have heard, so they might be a good bet for the future, even though we don't think hyperthreading would do much for a CPU bound number crunching application like our optimization unless you had multiple processors.

Broker, data and software to use with NST?
Date :2/26/2003 8:14:04 PM Poster : Dan Lucas
I am moving towards experimenting with using NST Day Trader with intra-day data and am looking at a various combinations of broker/trader, software and data feed. What confuses me is how NST fits in with all these different elements.

I know NST can take an intraday feed from Quote.com, so I suppose that whatever I do have to use something that is compatible with Quote.com's feed. So far I have been looking at the following.

---For my executions I was thinking of MB Trading, which has a good reputation and seems to have competitive pricing.

---MB Trading offers the MBT Navigator, which seems to be fully featured and nicely customisable. It also offers QCharts software using MB Trading's account, execution and order management software.

---For intra-day data, MB Trading supports eSignal, QCharts, DTN and Cron.

Any comments (however brief) on other users' setups, suggestions on how to approach this and so on would be gratefully received.

Dan

I recently switched to Interactive Brokers and I like them too. www.interactivebrokers.com.

In the upcoming release 4.0 there are other choices besides Quote.com. You will be able to use Esignal or TradeStation or program your own interface. However, Quote.com does not have the problems it did a couple of years ago, in my opinion.

The number of answers to the brokerage question are probably as varied as there are people :-) My suggestion is to check out Interactive Brokers. Their executions and quotes are very timely. If something goes wrong with the order routing/exchange, they actually tell you live with a popup message(interesting concept) :-)

Comissions are $0.01 per share (<500), $0.005 per share (>500)
Options are $1 per contract.
Futures are $2.40 per contract.
SSF's are $1 per contract.

If you want good executions with a discount broker with low comissions, IB are
hard to beat.

I've seen a couple of requests on the forum recently about Kirshenbaum Bands, so I decided to code them tonight for everyones benefit.

Please find attached a self-installing executable, complete with built in Neuroshell help, and fully working deinstall option. (The indicators are all coded in C for speed). The executable can be downloaded using the following link:

KirshenbaumBandsV10.exe

4 Indicators are included:

Kirshenbaum Band Upper - Upper K-Band
Kirshenbaum Band Lower - Lower K-Band
Kirshenbaum Band Center - Center K-Band
Kirshenbaum Band Width - Half the width between the upper and lower bands.

From some initial tests I've run, I have indeed found them to be better than Bollinger Bands.

A quickly put together trading strategy I built with it returned 22.7% PA, with 30 trades over 5 years (27 winners, 2 losers). Long Percent Profitable Trades (81.3% - 13/2), Short Percent Profitable Trades (100% - 14/0). Average Winning Trade Profit $0.89, Average Losing Trade Loss $0.09. Maximum consecutive losers: 1. Based on daily bars. And "No Optimization", i.e. results are not a curve fit anomoly. The strategy was nothing fancy, just K-Bands, and a profit target, with the strategy always in the market.

However personally I'd get bored waiting an average of 2 months for a trade :-)

Given the above results it would be worth looking at using K-Bands intraday and with more active trading strategies.

If there's enough interest around the K-Band subject on this forum (i.e. people submitting charts etc.), then I'll submit an "Adaptive K-Band" and "Jurik'd K-Band" to the forum too.

Mark,

I would like to second Steve's words of acknowledgement and appreciation. Your making available useful indicators is greatly appreciated. In fact, I plan to send Bowfort Technologies a cheque equal to the earnings of my first profitable trade using your indicators. (But don't quit your day job and don't hold your breath. I haven't committed any real money yet to trading. I'm still getting over the steep learning curve here and the twin humps of confidence and consistency in out of sample results.)

I'd like to outline my experience with K Bands and the simple trading strategy I used. I used Crossover conditions, as outlined in the videos, to generate buys and sells using the conditions below. This is based on a simple strategy, like Mark's, and the description of K Bands found in the site referred to by FHealy. The strategy there suggested a buy when the price pierced the lower band and the close was above the lower band. (I wasn't too careful about the Close in the conditions below.) The Sell is the inverse.

BUY LONG CONDITIONS:
CrossAbove(Kirshenbaum Band Lower(Close,5,10,1.75),Low)

SELL LONG CONDITIONS:
CrossBelow(Kirshenbaum Band Upper(Close,5,10,1.75),High)

I set the buys and sells to get end-of-day prices because I focus mainly on mutual funds and that's the best I can get. I used the NASDAQ Composite and S&P500 over the period Jan.1, 1996 to present.

Using these conditions "out of the box" with no optimization, my results were worse than buy and hold according to the stats. When I optimized over the same period, selecting optimal parameters, my results were an acceptable 20% or so per annum, with positive trades about 65% of the time.

I then tried a 9 month out of sample to present with one year of optimization before that. I also let the optimizer select between Low, High, and Close prices. My results were pleasing in a sense, getting a 12.9% annualized on the NASDAQ and 21.3% on the S&P, while buy and hold was negative for each. There were 3 winning trades and no losers over the 9 month walkforward.

Yet, I still don't have confidence to extrapolate these results into a real trading system because statistically, a sample of 3 seems too small. I've had many more cases of good optimizatiions follwed by poor out of sample. Also, when you eyeball the locations of the buys and sells here, they're embarrassingly far from optimal. Is this typical of a successful system or is this a fluke? Should good numbers be accompanied with visually pleasing signals. I would appreciate any comments along these lines and suggestions on how to improve this trading system.

Also, Mark, your idea of Adaptive indicators would have merit here. I noticed that K Bands adapt too slowly going from narrow to wide trading swings. As a result, high amplitude trading days can get you in and out far too early and we've had quite a few of these recently.

On 4/9/2003 4:06:33 PM Steve Ward wrote:
Thank you, Mark. As usual, you have been extremely helpful and generous with your time.

On 4/9/2003 1:15:45 AM zawie wrote:
I've seen a couple of requests on the forum recently about Kirshenbaum Bands, so I decided to code them tonight for everyones benefit.

Please find attached a self-installing executable, complete with built in Neuroshell help, and fully working deinstall option. (The indicators are all coded in C for speed). The executable can be downloaded using the following link:

KirshenbaumBandsV10.exe

4 Indicators are included:

Kirshenbaum Band Upper - Upper K-Band
Kirshenbaum Band Lower - Lower K-Band
Kirshenbaum Band Center - Center K-Band
Kirshenbaum Band Width - Half the width between the upper and lower bands.

From some initial tests I've run, I have indeed found them to be better than Bollinger Bands.

A quickly put together trading strategy I built with it returned 22.7% PA, with 30 trades over 5 years (27 winners, 2 losers). Long Percent Profitable Trades (81.3% - 13/2), Short Percent Profitable Trades (100% - 14/0). Average Winning Trade Profit $0.89, Average Losing Trade Loss $0.09. Maximum consecutive losers: 1. Based on daily bars. And "No Optimization", i.e. results are not a curve fit anomoly. The strategy was nothing fancy, just K-Bands, and a profit target, with the strategy always in the market.

However personally I'd get bored waiting an average of 2 months for a trade :-)

Given the above results it would be worth looking at using K-Bands intraday and with more active trading strategies.

If there's enough interest around the K-Band subject on this forum (i.e. people submitting charts etc.), then I'll submit an "Adaptive K-Band" and "Jurik'd K-Band" to the forum too.

One thing I've learnt is that Genetic Optimization is a double edged sword.

Genetic optimization works extremely well, and can produce fanastic results
on virtually any data provided to it (if it doesn't the underlying model is very poor).

The problem comes with the underlying model that's created by the trader.
I.E.

Model: Good
Optimzation: Good
Out Of Sample: Better

Model: Poor
Optimization: Good
Out Of Sample: Poor

I.E. The optimizer will tend to curve fit to the data. (This isn't a bug with the
optimizer, that's what you've asked the optimizer to do).

The optimizer needs to be constrained by using a good model. So it's important to use a good out of sample. But then you come across another problem, in that if you optimize over too long a period, unless the stock has been very similiar over the last 6 years, a 1 year recent optimization is likely to be more representative of what's happening now.

So it's important before you trade, that you test thoroughly to make sure you have a good model.

How to determine a good model? I've found the best way to do this is to look for stability. If a model is good, it will be stable when parameters are changed slightly. If slight changes result in large losses or gains, then I tend to suspect the underlying model.

However, that said, if you don't have a clue about the parameters to a system, then the Optimizer will find those for you. But most of the time you will have
(or should have) a rough idea of the parameters.

Mark
Thanks for all the work you post for free. Excellent Stuff. The Zjurik, Kirshenbaum Bands work well. For some reason I can not get Neuroshell to see the Adaptive, Volatility or Power Tools. Once installed these items show up in the indicator list but it appears the associated DLL can not be seen even though it is in the template folder. Any thoughts on how I can fix this problem.
Cheers
Larry

Mark,

Thanks for the tips on building better models.

Your suggestions to start with good models and to tighten the parameter search for the optimizer were quite effective.

Rel 4 and Stops

Date :3/4/2003 5:03:05 PM Poster : Maciej

Does anyone know whether the upcominhg release of NSDT will maintain the same method of handling stops as at present. That is, it is not possible to get stopped out on the same bar as you go in (in on the open, and out on the close of the same bar or stopped out also on the same bar as entry).
This is particularly irritating on a daily periodicity where in the case of volatile movements (in my case futures) I have a high chance of either achieving my target or being stopped out.
Currently the only solution that I see is to break the day down into smaller periods.
Thanks in advance for any feedback

Re: Rel 4 and Stops

Date :3/5/2003 3:39:44 PM Poster : Webmaster@ward.net

Actually you CAN get stopped out on the same bar as entry. You just can't get stopped out on the same bar as entry if your stop condition relies on knowing the entry price (i.e most of the built in trailing stops). As an example, a stop of MovAvg(Close,5) will get out on the same bar as entry if the price gets down (or up) to the MovAvg. Release 4.0 has no changes in this area.

Can I sugest that this be considered for the next release.
In the case of daily bars, and entry on Open, this means that one cannot get stopped out until the open of the following day. I would imagine this means that tests in those conditions, ie not using stops on the day of the entry, renders any results less accurate than they could be. In the case of 5/10min bars the problem is less crucial in so far as the likihood of a stop being triggered in the first bar suggests that the stop was unrealistic anyway. But in a daily bar! If implemented I'd suggest that a worse case scenario be adopted so that if a profit target and a stop loss were both triggered then the stop loss should prevail.
The only other way currently is to use say 30 min bars whilst treating all calculations as daily ie multiple ti,e frames.

Selective Sum

Date :3/5/2003 3:38:43 PM Poster : Rick D

Hi. I'm hoping someone can help me out. I am currently using DayTrader Pro with hourly bars. I would like to create an indicator which is a Selective Sum, where the condition for including a past bar in the sum is that the time of the past bar equals the time of the current bar, whatever time that may be. I don't know how to create a condition in a Selective Sum where the time of some past bar is always being compared to the time of the current bar. Can anyone help?

Thanks,
Rick

Re: Selective Sum

Date :3/11/2003 3:11:37 PM Poster : Webmaster@ward.net

We don't think that can be done in the indicator wizard; you may have to program that in C or PowerBasic. As a matter of fact, we already have coded one for our own trading purposes, and we'll put it in the Tips section of this website in a day or so. Ours computes the average of x previous prices at the same time, but you can just multiply by x to get the sum. For those interested in doing your own programming, we'll include the source code.

Re: Parameter equality restrictions

Date :3/11/2003 5:12:17 AM Poster : Yngvi Hardarson

Thanks.

I know I can fix parameter values and restrict their ranges.

I now realize that I didn't pose my question clearly enough. What I have in mind is say restricting the optimization process in such a way that e.g. the length of moving averages crossovers is equal for the long and short sides of a trading strategy but have their length optimized given that restraint. This could also apply for indicators being created using the Wizard where you want to fix the same period in many places but still optimize that single value. That latter problem can of course be achieved by employing indicators programmed outside NTSP.

Yngvi

In continuation of my previous response then I just realized that in my question only seems relevant as far as placing equality restrictions on trading strategy parameters. The ability to Map Variables in Custom indicators is there. However I don't see how I could apply the same technique for a Trading Strategy.

Re: Parameter equality restrictions

Date :3/11/2003 1:49:38 PM Poster : Maciej

Your right its impossible to constrain a parameter in an identical manner for both the long and short sides of a trading strategy at the present time. The optimiser will find one for the long side and another perhaps the same but that's not certain for the short side. We have requested the ability to have variables in a wish list in this forum.

Displaying Rule Values in Optimised Trading Strategy

Date :3/10/2003 3:20:20 PM Poster : Maciej

Hi,
Anyone one knows how to display the values of the rules/indicators that have been optimised in a trading strategy? If the indicators are not saved and renamed then the optimised values appear. If I save the indicator and name it then after optimisation the values do not appear. I'm using Jurik's JMA as part of the rule but I wouldn't have thought that should make a difference.
Thanks in advance for any feedback.

Exit same day as entry

Date :3/10/2003 8:04:39 PM Poster : John J

I have been trying to find a way to set up a trading strategy in NSTP such that a long exit will be automatic on the same day as an entry at the open. Can anyone explain how it can be done? Or is it impossible?

Thanks

Re: Exit same day as entry

Date :3/11/2003 1:44:49 PM Poster : Maciej

Depends on the periodicity. If you use daily data then a 1=1 in the exit strategy will suffice, details exist in the tips etc on this web site.
If you are using other frequencies then then there a couple of techniques that I use: a) the most obvious one is to use the Time indicators where you put in an indicator such as TIME>16:00:00 or whatever time you want to insure that you get out on the last bar. The inconvenience of this is that it does not take into account of special days when the exchange closes earlier ie @ 12:30:00 unles you create a holiday indicator - quite easy to do but tedious to maintain. b) the one I use for testing but its not really for actual trading is to use the LEAD indicator and compare the time to that of the next bar, if the time of the next bar is less than the current bar's time then it must be another day so out we go.
Both techniques are quite straightforward but if you want the code for the latter then let me know. The beauty with NSDT is that you can usually create want you but it doesn't always have the things that traders would assume as obvious.
Regards

Inside your Trading Strategy Wizard, select the Long Exit tab. Then click the Add Condition(s) button and then the Indicator button. This brings you to the Indicator Wizard where you can use an indicator from the Time Flags catagory. Finally, select the Time >= X indicator and insert a time of (say) 3:50 PM.

You may want to use a Time <= X indicator in your long entry so that you don't immediately open a new long entry after closing your original long.

I hope this helps.

Optimization rule request

Date :3/11/2003 10:25:21 AM Poster : Tom Nunamaker

It would be nice to allow rules for optimizations that include more logic such as a rule that parameter X is always less than parameter Y, where X and Y could either be in the same indicator or different indicators. Another useful rule would be to tie an optimized parameter to multiple locations simultaneously. For instance, if I'm optimizing BUY and SELL strategies and I want to use the same values for an indicator for both sides, I would want the optimizer to always use the same number in both situations. Occasionally ratios or adding constants would be nice too. For instance, if I have two parameters in an indicator X and Y. If I want to use X from 1 to 10 and Y from 2 to 20, but Y is always double X. Or, Y is X+ N where N is what needs to be optimized.

I don't think these are possible currently so consider it a request for a future release. If this is possible to do now, I'd love to know how to do it.

Re: Optimization rule request

Date :3/11/2003 1:55:23 PM Poster : Maciej

Tom,
Part of what you want is possible. If you require that parameter X is dependant on the value of Y then that's feasible, essential you create a custom indicator which allows you to link your variables and then you use a boolean for instance: and (crossabove(movavg, movavg2),movavg1length1<movavg2length2)
Hope that helps.

Re: Optimization rule request

Date :3/13/2003 4:15:48 AM Poster : Maciej

Taken to extremes I've even managed to stop the optimiser from finding an optimal solution. The method was simply to add more boolean constraints, in my case insisting that the variables in a movavg formula were only Fib values say from 3 to 55: the optimzer coldn't find an optimal solution. It seems that it would be best to have NSDT provide the facilities of variables rather than get us coding these

Occasionally ratios or adding constants would be nice too. For instance, if I have two parameters in an indicator X and Y. If I want to use X from 1 to 10 and Y from 2 to 20, but Y is always double X. Or, Y is X+ N where N is what needs to be optimized.

I don't think these are possible currently so consider it a request for a future release. If this is possible to do now, I'd love to know how to do it.

Re: Optimization rule request

Maciej,
I'm not clear exactly how you achieve this. Suppose I have an indicator that has two variables where Y = 2 X. I would create an indicator called "DoubleX" for the sake of discussion. Suppose I'm trying to calculate a MACD and I want:

ExpAvg2 Periods = 2 * ExpAvg1 Periods

How would I construct the MACD so the optimizer would use the "DoubleX" indicator and keep that 2:1 ratio in the ExpAvg periods?

Thanks

Tom Nunamaker

Tom,
Part of what you want is possible. If you require that parameter X is dependant on the value of Y then that's feasible, essential you create a custom indicator which allows you to link your variables and then you use a boolean for instance: and (crossabove(movavg, movavg2),movavg1length1 Hope that helps.

Tom,
I've got a custom indicator that should do what you need, you'll need the ability to save your indicators. Essentially it is

IfThenElse(A=B(A=Mul2(2,B),MACD(Close,B,A),0)

If you save the indicator you'll be able to link A variables as one, the B variable as one, hide the 2 variable and hide the 0 variable).

This will force NSDT to display a MACD when your condition is true. The optimiser should go through the possibilities and give a MACD that is optimised whilst maintaining your condition.

Sorry the boolean approach is perhaps not appropriate in your instance even if the IF does much the same job as the AND.

I can pass you a tpl but someone will have to tell me how to transmit it.

Two Bar Reversals

Date :3/13/2003 4:23:20 AM Poster : Maciej

Hi,
Has anyone had a stab at coding two-bar reversals (p49, fig 1 of March 2003 Active Trader)?
Its how best to code the implied fuzziness that intrigues me. i.e. how to set up indicators that correspond to "closes near the high", "sharp rally" etc. Visually recognizig such patterns is easy; but how best to get NSDT to understand these concepts. I don't think that the Fuzzy and Adapt 1 addons have the solution.
Alternatively will the "Tips From Active Trader and Other Sources" be updated to include this challenge?

Re: Two Bar Reversals

Date :3/13/2003 11:23:46 AM Poster : Xprogrammer

It seems like you should be able to make rules to implement that strategy. For the trend before the bars you could use a regression line, or a series of higher closes. I agree it wouldn't be fuzzy, but the amount of variation might be due to what issue is being traded, no?

Thanks for the rules advice. I'll try that by defining the rules in NSDT and then normalizing them so that they could be used by a net.

Linking Parameters

Date :3/13/2003 4:54:07 PM Poster : Steve Ward

One of the highest priority requests on the wish list you guys voted on and Steve Kratochvil put together was the ability to link parameters so that they optimize to the same value in buy and sell rules. Furthermore, I keep seeing this come up over and over in this forum and in our tech support requests. Therefore we're going to break our long standing policy of not adding new things to already programmed releases, and we are going to try to get that feature into the upcoming release 4.0.

Re: Linking Parameters

Date :3/13/2003 5:49:30 PM Poster : Maciej

That will be great!

Don't expect better models "in sample" - they'll not be as good as when the optimizer is allowed to roam freely. However, as someone pointed out on the forum a while ago, there is a possibility that linking will cause less overfitting and might produce better "out of sample" results. In any case, a lot of you will feel much better about having the symmetry.
>
> The feature I REALLY like best about release 4.0 is that you can tell it exactly how long to optimize. For those that think it is too long, now you can shorten it. For those (like me) that think it isn't long enough, you can let it run all night if you want without having to "re-optimize".

Data CD File format

Date :3/20/2003 8:34:10 PM Poster : Bill Mitchell

I would love to be able to place the data from the Data CD into a database. It would give me the ability to search it with complex SQL queries to locate volitile cyclic equities that would work well in NeuroShell trader. My problem is I am not familier with the file format for a *.WSG file and have not been successful in my attempts to import it into an RBase, Access or VB format. A Java library file for reading .wsg in Java or Java Swing would be cool too.

So far I have been using the standard but lame "stock locator internet sites" that narrow the search down to just hundred and hundreds of stocks that I then filter through some standard trading strategies to locate the few "diamonds in the rough". There has to be a better way.

Does anyone have any sugestions?

DLL's

Date :3/21/2003 10:15:49 PM Poster : John J

NSTP allows selection of only one optimization criteria. It seems that it would be much better if one or more additional criteria could be optimized simultaneously. For example, along with "Max Net Profit", a limit on % drawdown could be specified. Then all parameter sets producing a greater drawdown would be rejected during optimization. Could this be accomplished with a DLL?

Thanks, John J

> ***Re: DLL's***
>
> Date :3/24/2003 5:33:20 PM Poster : Steve Ward
>
> Currently you cannot craft your own objective functions. However try using the one called Maximize ratio net profit/maxdrawdown. That should accomplish at least the example task you are after, maximizing profit while simultaneously minimizing drawdown. It does not accomplish the flat rejection of drawdowns over a preset limit, but for technical reasons, GAs work better when fitness functions provide a sliding scale of goodness rather than restrictions in binary form. Crafting your own objective functions may come in the future, but generally if a model does poorly with one objective function, it will do pretty poorly with many of the others as well, and vice versa.

Selective Optimization

Date :3/22/2003 12:55:31 PM Poster : Maciej

When using the Full optimization option of testing a trading strategy it would be very useful if only certain indicators where optimized and not others. The logic being that some indicators are actual triggers for say an entry whilst others are simply there as a representation/constraint of the real world say a rule that insists on exiting at EOD regardless of the result. So say a series of various moving averages could be optimised by rule selection (the parameter optimization is not the issue) whilst the exit rules remnained in place.
Has anyone figured on doing this with the current release or is this something for a future release? My current approach is to optimize without my "real world" constraints and once I've something promising then to add the non-optimizable rules. That's sort of cheating and I'm not sure if an optimal result can be so obtained.

printout of trading strategy -- lacks conditional trigger

Date :3/25/2003 8:40:59 AM Poster : chachi

When printing everything for a trading strategy, when dumping the rules, the printout shows everything one could wish to see EXCEPT how the rules interact/trigger (eg must be 1, 2, 3, ALL rules)...

How about adding the "1,2,3,4,5,6,ALL" dropdown setting to the printed output ?

Wish List Addition

Date :3/25/2003 11:53:09 AM Poster : Maciej

I'm not sure if this wasn't already requested but it would be very useful if in the trading strategy wizard when setting the parameter ranges for various variables one could see the non-optimized (default) value that has been set. The wizard has a way of hiding the original value and proposing extremes in most cases reasonable but that doesn't make it easy if one just wants a particular variable not to be optimised. Perhaps a more elegant improvement would be to allow parameter optimization selectively. Currently the only way round this is to save the indicator and hide the parameter and then use it in a trading strategy.

The Moving Trend

Date :3/28/2003 6:18:01 AM Poster : Ergo Mann

I had previously used both Ehler's Zero-Lag Data Smoother and Ehler's Smoothed Price, however, the Moving Trend mentioned in January's Stock & Commodities magazine has proved of significant benefit.

Thanks Marge.

Carolan's concepts (cycle or windows) and Fisher's theory

Date :3/29/2003 12:09:23 PM Poster : Darek

Has anyone implemented a Carolan's concepts (cycle or windows) and Fisher's theory of capital and investment into NST trading strategy?
I have heard that the best results we can get if we fit both theory together.
Thanks, Darek

Wish List addition

Date :3/29/2003 5:01:53 PM Poster : Walter

These wishes concern the interface of NT and would make the interface more consistent and user friendly..

1. On the Prediction or Trading Wizard Dialogue boxes (there may be other boxes as well). let double clicks select the instrument and bring up the Analysis screens.

I find myself going to the Prediction Analysis or Detailed Analysis quite frequently. Now you have to select the Instrument and then move the mouse to the Analysis button and click again. Why not have double clicking the instrument bring up the Analysis Screens directly, saving some mouse stroking?
This would be consistent with other double clicking in NT, like for example selecting an Indicator on a chart?

2. Have NT remeber your last tab selection.

Many times I revisit the same tab making adjustments on the criteria. Sometime it's to adjust the dates to check results over different time periods. When in this mode I revisit the same place many times. This would save time going to the desired tab over and over again.

These aren't what you would call "must haves" but they would incrementally improve the usability of an already excellent interface, for me and possibly others operating in "parameter adjustment" mode. They also don't seem like a lot of work for the programmers.

Re: Wish List addition

Date :4/1/2003 11:20:08 AM Poster : Maciej

Good idea.

Another thing that would be useful would be the ability to use in indicators "system" information of the nature: periodicity, chart name etc - a bit like Trading Strategy: System Information but related to the chart. Information such as periodicity would be useful in creating generalized indicators.

This would be consistent with other double clicking in NT, like for example selecting an Indicator on a chart?

2. Have NT remeber your last tab selection.

Many times I revisit the same tab making adjustments on the criteria. Sometime it's to adjust the dates to check results over different time periods. When in this mode I revisit the same place many times. This would save time going to the desired tab over and over again.

These aren't what you would call "must haves" but they would incrementally improve the usability of an already excellent interface, for me and possibly others operating in "parameter adjustment" mode. They also don't seem like a lot of work for the programmers.

Re: Wish List addition

Date :4/2/2003 4:33:41 PM Poster : Walter

Another function for the user interface that would be useful to me (and others I think) is to allow you to easily display the OPTIMAL Rules on the chart, as described under the Trading Rules tab of the ..... Detailed Analysis, after you've completed an optimization. The only way I know of doing this is to reconstruct the Indicators using the optimal parameters. Sometimes the Indicators you build have many parameters, some of them non-integer; so it's very tedious, time consuming and error prone to reconstruct from scratch. especially if you go through a lot of optimizations.

I would like to do this so that I can eyeball the signals generated against the time series, both in the optimization run and in the walk forwards.

If there's already some easy way of doing this that I'm not aware of would someone be kind enough to show me how this is done or point me to the documentation?

Thanks for reading

On 4/1/2003 11:20:08 AM Maciej wrote:
Good idea.

Another thing that would be useful would be the ability to use in indicators "system" information of the nature: periodicity, chart name etc - a bit like Trading Strategy: System Information but related to the chart. Information such as periodicity would be useful in creating generalized indicators.

On 3/29/2003 5:01:53 PM Walter wrote:
These wishes concern the interface of NT and would make the interface more consistent and user friendly..

1. On the Prediction or Trading Wizard Dialogue boxes (there may be other boxes as well). let double clicks select the instrument and bring up the Analysis screens.

I find myself going to the Prediction Analysis or Detailed Analysis quite frequently. Now you have to select the Instrument and then move the mouse to the Analysis button and click again. Why not have double clicking the instrument bring up the Analysis Screens directly, saving some mouse stroking?

We think your #1 will be in the release 4.0 beta, so it should then be in release 4.0.

Getting a Net to think like a trader

Date :4/2/2003 5:46:24 PM Poster : Dave Hubbard at Midwest

I have developed a trading strategy that works across a variety of markets. I tried putting the same indicators from this strategy into a net. The net found something totally different and it didn't always work out of sample (due to overfitting). How can I get a net to think like a trend-following system (strategy) and possibly improve my existing system if not at least trade similar to the strategy itself?

I am wondering would it be a good idea to throw in binary system rules? The turbo prop is not supposed to work well with binary rules so I don't know if I could trust any good results that I may get from this idea. I also have the neural indicators add on. Which nets in the neural indicators might be better suited to this idea?

Does anyone have experience in taking an existing trading system and getting a neural net to trade like the system?

This could be an interesting thread and any feedback would be helpful.

Re: Getting a Net to think like a trader

Date :4/3/2003 12:39:39 PM Poster : Maciej

I've run into "problems" when I've optimised indicators together with stops and exits all together in one trading strategy. My solution has been to separate the entry triggers/indicators (using nets or not) from the the actual "production" trading strategy where I have my trader's constraints ie $ stops and such like. This seems to give better results as the nets/genetic algorithms are not contaminated by the real world constraints so the signals are purer. Once I've worked out my entries I then set my stops/exits to my pain threshold. Perhaps you could try to separate some your components so that a part concentrates on say optimising your net and another part handles the trader component.

Thank you for your suggestions. I do have one more question for anyone who wishes to answer. How do I take a traditional trading system (such as those found in Trade Station, Metastock, or the templates in the Trading Strategy Wizard) and use a net to improve the system? Any ideas?

Re: Getting a Net to think like a trader

Date :4/6/2003 6:01:33 PM Poster : Maciej

Two phrases keep croping up here as regards to nets: normalize (data) and pattern recognition. There are examples on how best to normalize your data/signals/indicators to ranges of values more easily understandable by nets - essentially that means keeping the ranges under control (there was an excellent article on nets and horse racing that Ward systems made availble that showed the beneficial effects of normalizing data). As regards pattern recognition I myself find that the usual A>B for a standard indicator is less satsifactory than say a and b as separate inputs or the ratio of a over b. But there is a lot experimentation required. Another way to create a pattern is to use lagged values of one indicator; as an example: the lag of the slope of the price - just provide the values of the slope of say the five previous bars and hopefully the net has a pattern.

Re: Getting a Net to think like a trader

Date :5/28/2003 10:11:14 AM Poster : Bertrand

Dave,

I have also played with the stratgy of advancing binary trading signals through a NN, with a BackProp product for Excel. Of course you then need to introduce trading thresholds to the concept, cause net output function will never exactly produce the original binary thresholds. I then optimized the tresholds, which certainly increased net profit. But since TurboProp does not seem to work so well with binary, you need another solution:

Have you tried predicting your basic indicators you use in the trading strategy? This could also be done using some self retraining indicators like the Adaptive Turboprop2 set (which is very effective when combined with the GA in NSDTP).

One more hint: Try several experts with different prediction horizons (like 1-2-5-10 bars in the future). Finally you put the different experts into one trading strategy & let the GA find the best setup.

Maybe you could post your findings here :-)

Regards
Bertrand

Addition to Wish List

Date :4/6/2003 10:54:24 AM Poster : Stewart Robinson

I don't know if this has been requested before, but it would be great if the functionality of Neuroshell Trader and derivatives were exposed as an OLE Automation Object. This would make the entire Neuroshell Trader environment scriptable via Visual Basic for Applications, or other languages that allow interaction with Automation Objects.

I am currently working on unattended operation using Microsoft's Windows Script 5.6. This is a little more difficult than it needs to be.

Thanks,

Stewart

Re: Addition to Wish List

Date :4/16/2003 5:18:02 PM Poster : Rob Lenzie

To deal with this NS Trader shortcoming I've made a lot of use of Macro Express - www.wintools.com - $38 - without doubt the best $38 I've ever spent. Its a mature well thought out product and has all of the funcionality you need to drive Trader 24 x 7 - If Then Else Logic, ability to read files, ability start and terminate programs, ability to tell when a window has got and has lost focus, ability to record and edit mouse movements, excellent help system and very good technical support etc etc. However it takes some time to get the hang of driving a windows program from the outside and dealing with the inevitable execution problems that arise.

That was a long time ago, I think (from memory), it was based very closely on example 4. Try a TDNN'd Peakprob/Valleyprob as inputs to a net predicting somewhere in the range 3-10 bars ahead. See how well that works, then see if a short term stochastic (again TDNN'd) helps improve it. (Ideally a DiNapoli stochastic, but the regular stochastic won't be far off).

Automated trading and Interactive Brokers

Date :4/15/2003 8:10:01 PM Poster : Andy Bower

I've been playing with the Turning Points add-on and have come up with a promising strategy that I'd like to trade on 15 min bars. I want to be able to submit these orders automatically using the Interactive Brokers API. I thought of several ways I might do this; do you think any of these is viable:

1) Ideally the Neuroshell Runtime Server or Engine would be available and allow me to embed the net as an ActiveX component into my trading software. I could feed the Quote.com data to it and receive trade triggers back. From what I read about these two products, they are not available for NeuroShell DayTrader Pro nets; is that right?

2) Alternatively, I could embed an external DLL call into my NSDT trading strategy. I'd want to call the DLL as each trade is fired and then write the DLL to pass the signals to my trading app. Is this approach possible and, if so, how?

3) Finally, I could do this. I notice that there is an add-on (called TradeBolt) for TradeStation that will forward trade signals to Interactive Brokers.

http://www.investlabs.com

I "think" this uses a product called WinBatch (www.winbatch.com) to pickup on the pop-up alerts that TS issues for each trade and then interprets the contents of these alerts and passes the info onto TradeBolt and then to IB. At a push I suppose I could do something similar with the alerts that are issued from NSDT, I don't fancy this much since there is really too much to go wrong (not good for any trading system).

Does anyone have any comments on the above suggestions, or any better ideas?

TIA

Re: Automated trading and Interactive Brokers

Date :4/18/2003 7:47:46 AM Poster : bruno

Hi,

If you don't mind programming a little, you can relatively easily write an interface to IB using their TWSAPI interface. They do provide code samples in VB and VC++
Please note that you would also need the DataX add-on for NeuroShell Trader. The only 'annoying' issue I came across was dealing with correction quotes from Quote.com.

Best regards,
Bruno

Bruno,

Thanks, that seems *exactly* what I need. I hadn't seen the DataX API add-on information before. I've already written several Smalltalk apps that talk to the TWSAPI so it shouldn't be too had to integrate NSDT using the DataX stuff as you suggest.

Best regards

Andy Bower

Consistency with walkforward results

Date :4/24/2003 8:15:16 AM Poster : Andy Bower

I've been experimenting with training some predictions with multiple walkforwards and have come across some results that I don't understand. I'm using 30 min bars with 2 years data loaded.

Let's say I train a net with 2 six month walkforwards and a 1 year training period. I beleive this results in the following evaluations:

<1 year training> <6m WF2> < xxxxxxx > | today
< xxxxx > <1 year training > < 6m WF1 > | today

The out of sample results I get for the walkforwards are:
WF1=31.4%, WF2=99.5%

Now, I would expect that if I reduce the number of walkforwards to 1 and keep the training period the same then I should have this situation:

< 1 year training > < 6m WF1 > | today

To me this seems like the same situation for WF1 in the original test and I would expect identical (or comparable) results. However, for this situation I get the following actual result:
WF1=0.1%

Can anyone explain why this is the case. Am I not understanding the walkforward testing correctly?

I would like to develop a Trading Strategy where I use an indicator which for an Entry Condition places a stop below (or above) the entry price, and the stop price will remain at that level until either an Exit or Stop is triggered. ex. I want to put a stop in of 2N(my indicator) when my entry is triggered. 2N currently is 4 points, stock is at 50, I want a stop placed at 46 and to stay at 46 until I'm stopped out or exited.

There are some in there that stay a fixed distance from entry price. There's also one somewhere called value when entry activated that you could use to capture the value of your 2n when the entry is triggered.

I would like to develop a Trading Strategy where I use an indicator which for an Entry Condition places a stop below (or above) the entry price, and the stop price will remain at that level until either an Exit or Stop is triggered. ex. I want to put a stop in of 2N(my indicator) when my entry is triggered. 2N currently is 4 points, stock is at 50, I want a stop placed at 46 and to stay at 46 until I'm stopped out or exited.

Re: Trailing stops based on ATR

Date :5/23/2003 9:03:57 AM Poster : William

If the market were to go slowly down day by day [say minus 1 ATR each day] , would my 3*ATR stop be triggered on the third day ? I want my stop to get tighter but never looser . When inserting a new indicator on the trailing stops tab , does the programmed stop automatically trail at the highest price [for a long trade] that the 3*ATR multiple below the close reached [while never receding] ? And what if I DID want the stop to be based only on the last day's close , and tighten or loosen accordingly [I am still experimenting as to my preference , though I am leaning toward the inital theory] ? On a related point , I would like to explore using ATR multiples as price targets . I am thinking that I would then use something very similar to the trailing stop indicator I have been discussing , except of course I would enter it in the price target [or exit signals ?] tab instead . Such as : Close + 3 * True Range [for a long] , and : Close - 3 * True Range [for a short] . This would of course depend on the answer to the above question regarding a stop pepetually tightening without loosening , because I would similarly wish a price target to perpetually tighten without loosening . And , also as above what if I DID wish the stop to tighten or loosen day to day ? Forgive me if these are "simple" questions , and I have therefore been too thorough in my explanations [or "complex" questions , and I am therefore potentially taking alot of someones time in order for them to answer !] . I thank the forum members for there patience and earnestly hope that I am not the only one gaining by this thread !

Re: Trailing stops based on ATR

Date :5/27/2003 1:09:08 PM Poster : Ward.net Webmaster

> Does the programmed stop automatically trail at the highest price?

Many of we ones we provided do trail, but we can't automatically make your custom ones do that. Yours use only the last value and will therefore tighten and loosen according to your formula. However, we've provided indicators so you can make your indicator trail. Just use the MaximumValueSinceEntryActivated or MinimumValueSinceEntryActivated indicators in your formula (Max for long position stops and Min for short position stops).

> I would like to explore using ATR multiples as price targets

Just remember that unlike training stop indicators, exit signals must be true/false and therefore your price target should be something like Close >= Close+3*TrueRange. You should also use the MaxSinceEntry/MinSinceEntry indicators described above if you want the price target to always tighten without loosening.

The Alpha in stocks

Date :5/6/2003 10:54:37 PM Poster : Khean

1.In stock technical analysis, we often hear about the Beta, but less so about the Alpha (the point on the Y-coordinate).

2. Unlike Beta, for which we know what it means when say, the Beta is 0.8, we don;t know what the Alpha value means.

3. Does anyone know how to intepret Alpha quantitatively? What time period is suitable for a good Alpha Indicator?

Thanks

Re: The Alpha in stocks

Date :5/7/2003 10:18:34 AM Poster : Marco Calzolari

It is the result of a linear regression between a stock and the index, calculated on their daily or weekly percent changes. The Beta is the slope, the Alpha is the intercept, or in other terms, it a (daily or weekly) percent change in the stock that is not explained by market movements. Positive Alphas are positive for the stock. Suitable time period: same as Beta. Academics would say at least 5 years based on weekly changes, I would say at least 5 days ;-)
It is anyway an indicator of what happened in the past. If you use Alpha in a trading system, why not search the best time period with the genetic optimizer?

Re: The Alpha in stocks

Date :5/7/2003 10:51:59 PM Poster : Khean

Thanks Marco. Can I ask addiitionally:
(1)Does it mean a stock with an Alpha of 3 is stronger and has more potential than one with an Alpha of 2?
(2)What about stocks with negative Alphas?
(3) Or is a change in Alpha more relevant than its absolute value for purpose of analysis?

1) Yes
2) They are dogs; they might even rise with the market if they have a high Beta, but you are taking a bigger risk for your reward.
3) Sure, I would search for high and positive alphas, and possibly for an indicator which could forecast future alphas.

Longer term nets

Date :5/8/2003 8:33:02 AM Poster : Dave Hubbard at Midwest

It seems like the only good nets that I can develop have an average trade span of 5 bars or less. Has anyone been able to develop a decent neural net that might only trade once a month? If so, what steps have you taken to develop a net like this? I am just curious as to what other users experiences might have been. I have had some mixed successes and failures in changing the average trade span settings.

Re: Longer term nets

Date :5/9/2003 8:44:43 AM Poster : Xprogrammer

I have two ideas on that. One is try weekly bars and the other is try increasing costs (commissions and slippage). Tell me how those ideas worked.

On 5/8/2003 8:33:02 AM Dave Hubbard at Midwest wrote:

Re: Longer term nets

Date :6/12/2003 8:10:05 AM Poster : Doug B

For mutual funds using weekly bars and the Neural Net add-on I have generated excellent longer term signals.

Threshold optimization

Date :5/8/2003 9:51:21 AM Poster : Dave Hubbard at Midwest

I have recently made some decent nets using the full optimization in the prediction wizard. Since I was optimizing for both inputs and parameters, I left the entry and exit thresholds at zero. Upon looking at this net, my boss brought up a good point. He said he would like the net much better if the entry and exit threshold were different to avoid excessive whipsaw when the prediction curve is too close to zero.

My experience with threshold optimization has been that it many times will find values that cause the net to always be in the market. Without changing the net to an optimal buy sell hold style net, I was thinking this problem could be solved from 2 angles:

1. I could look at the prediction curve after the net was created and manually put in my own values.

2. I could preset the values and recreate the net and hope that it finds a curve that trades around those values.

I am wondering some other user's might think about either of the two ideas.

Thank you,

Dave

Re: Threshold optimization

Date :5/13/2003 8:30:05 AM Poster : Ward.net Webmaster

You have reasonable ideas. Our suggestion - try both and see what works best.

Complete DLL example

Date :5/10/2003 11:05:20 AM Poster : Larry Burford

I'm finally geting around to learning to use DLLs after several unexpected distractions. I've been looking over some of the example code you provide (MovAvg.bas) and it seems to me that it is not complete: only the export routines are shown.

There is no code in this example that will allow the PB compiler to know that it should make a DLL instead of a regular EXE. I have an example file from PB that shows about a page of code to do this. It starts with a few compiler directives and finishes with the LIBMAIN function. The export routines then follow.

I consider myself an expert programmer - I speak Basic, C, Java and Pascal and I've been using DLLs (mostly from the WinAPI) for many years. But this will be my first attempt to "WRITE" a DLL. I look at the example from PB and the example from WSG and realize that, to a first approximation all I need to do is insert the page of DLL "header" material from PB in front of your export functions and I'll have a "complete", ready to compile into a DLL, source file.

But, the PB example "header" is very generic in nature, and contains some items that might be optional.

And, the LIBMAIN function in their example comprises a simple CASE structure that tests for four different conditions. Instead of code following each of these CASEs it has comments like "DLL is being loaded by another process - insert code to initialize your global data here" and "DLL is being unloaded by the calling process - insert code to clean up resources here".

==========

Even if your export function "MovAvg" has no need for initialization or cleanup, you can't compile to a DLL without the compiler directives and at least an empty LIBMAIN function that returns a "1" to tell Windows it is OK to continue.

Do you have additional help material/examples that show a complete, ready to compile DLL source file? Or am I just looking right at the answer and not seeing it?

Regards,
LB

Re: Complete DLL example

Date :5/13/2003 8:26:44 AM Poster : WEbmaster@ward.net

Our code was complete for the PB/DLL compiler at the time it was written. Only just recently PowerBasic has changed their compiler, perhaps to combine the DLL capabilities with the EXE capabilities (we haven't examined their new compiler yet). Those examples may now need to be changed.

Re: Complete DLL example

Date :5/19/2003 1:56:17 PM Poster : Michael Begley

I know you guys at Ward must be very busy trying to get the next release out but if you could update the Power Basic DLL examples sometime it would be very useful. I am going to purchase Power Basic today after Steve Ward's ecouragement in the AI College course I took last fall. I have written a lot of Tradestation algorithms over the last 5 years and used other procedural languages in the very distant past, but I far away from a proficient programmer in modern languages. I expect to be able to logically lay out my first DLL program and implement it (I already have done it and traded it in Tradestation) but my usual hangup is ENVIRONMENT type isses such as Larry Burford raises. The DLL creation option looks very powerful and I am going to have to become competent doing this for myself.

I thank you in advance for attending to this when you can.

Mike Begley

Instead of code following each of these CASEs it has comments like "DLL is being loaded by another process - insert code to initialize your global data here" and "DLL is being unloaded by the calling process - insert code to clean up resources here".

==========

Even if your export function "MovAvg" has no need for initialization or cleanup, you can't compile to a DLL without the compiler directives and at least an empty LIBMAIN function that returns a "1" to tell Windows it is OK to continue.

Do you have additional help material/examples that show a complete, ready to compile DLL source file? Or am I just looking right at the answer and not seeing it?

Regards,
LB

Re: Complete DLL example

Date :5/19/2003 4:17:21 PM Poster : Ward.net Webmaster

You are right that we need to update our example to their new compiler, and also right that we are very busy trying to get release 4.0 out in early June. However, perhaps in the mean time Larry Burford will send us the modified example he made and we'll post it here? Larry if you are willing send to forum@ward.net.

On 5/19/2003 1:56:17 PM Michael Begley wrote:
I know you guys at Ward must be very busy trying to get the next release out but if you could update the Power Basic DLL examples sometime it would be very useful. I am going to purchase Power Basic today after Steve Ward's ecouragement in the AI College course I took last fall. I have written a lot of Tradestation algorithms over the last 5 years and used other procedural languages in the very distant past, but I far away from a proficient programmer in modern languages. I expect to be able to logically lay out my first DLL program and implement it (I already have done it and traded it in Tradestation) but my usual hangup is ENVIRONMENT type isses such as Larry Burford raises. The DLL creation option looks very powerful and I am going to have to become competent doing this for myself.

I thank you in advance for attending to this when you can.

Wavelets and Fast Fourier Transforms

Date :5/13/2003 1:35:48 PM Poster : Dave Hubbard at Midwest

Are there any websites or books where I might find information on these classes of indicators as to what they mean and what the parameters mean explained in a simplified manner? These indicators look like they have potential but I want to understand what they are doing first before I start putting them into nets. Any refrences or explanations would be appreciated!

Thanks,

Dave

> >
> > Unfortunately, one of those zero points is "Now". I.E. Exactly the point you're trying to model with accuracy, you've just wiped out by the constraints of the analysis. This introduces a form of End Point Distortion. I've seen some articles which attempt to predict with FFT's, but skirt around the EPD problem, which, to me, seems a pretty darned big issue.
> >
> > I do have a suggestion that may help (I haven't tried it myself yet though). When you scan a document, you may not get the page square to the scanner, but most scanning software will rotate the page for you, so that everything lines up. Think of an fft the same way. I.E. Take the beginning of the sample (lets say it's $95), and the end of the sample ($106), and calculate the slope of the line between them. Then rotate price by that slope, so that the beginning and end are the same price. Then subtract the offset

Thank you...

Date :5/16/2003 1:39:27 PM Poster : Stewart

Steve-

I just wanted to thank you for your great product. I have been dreaming about doing this (trading for a living) for 12 years. I bought some of your original neural net components (Neuroshell 1.0), and realized back then that the system integration was beyond me (I was already a full time programmer). It was the Neuroshell Trader product that finally enabled me to do what I do. Tradestation is a piece of brown stuff compared to your product.

I am now deriving a living from trading a small futures account (absolutely amazing).

Thank you and please don't got out of business.

Stewart

> I thank you for the nice words. Of course there are a lot of people here who have worked hard to make the product what it is, not just me. We don't plan on going out of business, but the best way to assure we don't is to tell people about us. Companies like ours always need NEW business to keep us bringing older customers support and updates. All of our advertising and all of our sales pitches aren't nearly as important to your friends as a recommendation from you.

NN Prediction dates

Date :5/22/2003 3:05:22 PM Poster : Michael Stigall

I can remember (showing my age/experience with Ward's tools) when the default value for the number of days to predict with the neural network was 10 days out. Recently I've seen 5 days used. The new examples with the Turning Points indicator uses 2 days.

Is this due to changing market conditions, or testing of the indicators for best predication range of stocks? Just conservative estimates?

Overseas Markets...

Date :5/22/2003 10:11:23 PM Poster : Stewart

My system involved trading index futures like the Nasdaq 100, S&P 500 and the DJIA. I am interested in extending this system to other markets, perhaps europe and asia. Does anyone have any pointers on how I can get this data into Neuroshell Trader? I need to collect data on the components of the index. For instance, my strategy on the nasdaq 100 requires that I collect data on the top 30 stocks of the nasdaq 100.

Thanks for the info,

Stewart

End-of-day data is available in the more developed markets of Asia e.g. Hong Kong, China, Singapore, Malaysia, Australia. You can use such data for NeuroShell. I have a hobby web site on Shanghai, Shenzhen and Hong Kong stocks and Index using Neuroshell as part of the system. See www.fu-lu-shou.com

MESA2002

Date :5/31/2003 12:25:54 PM Poster : Richard Nowak

What do you get with MESA2002?
1) I'm assuming you get one or more DLLs. What are they?
2) I'm assuming you get template files. What are they? Are they password protected?
3) What documentation do you get with it?
4) Has anyone tried to implement any of the coded examples from the book "MESA and Trading Market Cycles?" which makes calls to the DLLs? I plan on converting the EL code to PB for use in NSDTP.
5) Do I need to specify anything other than its targeted use is NST when ordering?
6) Any other information about it is appreciated.

Since the software is not returnable, I want to get a greater understanding of it than what is provided on the website.

TIA,

Rich

Re: MESA2002

Date :5/31/2003 2:55:50 PM Poster : Michael Begley

I would also be interested in hearing if any NST users found MESA indicators useful in any of their profitable production systems.

I also have TradeStation code for one of Ehlers' earlier books and planned to check out its usefulness in that environment before purchasing anything additional or doing any DLL coding for the NST envoronment.

Thanks.

Mike Begley

Re: MESA2002

Date :5/31/2003 6:55:23 PM Poster : Richard Nowak

What I've learned: MESA2002 is a collection of indicators based on the MESA measurement of the Dominant Cycle. There are seven indicators. Each has a TPL file, and the TPL files are open (no password). There is a DLL associated with each TPL. Reading the TPL files gives you the means to see how the DLLs are declared and called. The indicators are: Dominant Cycle, Kalman Filter, Instanteous Trendline, Sine, LeadSine, Phase, and Market Mode. No programming documentation is provided and John does not have the resources to provide programming support. However, his book "MESA and Trading Market Cycles" should be sufficient. Anybody have any recent experiences with these indicators? Rich

Iff you are using ESignal then you could try Mesa as part of Esignal before you commit.

I've bought and tried Messa2002 for NSDT but have been unable to use it to benefit me in my futures trading.

In answer to your questions:

Yes there dlls and also tpls for calling the indicators from NSDT.. The security system employed by Mesa has not been an issue. The Mesa software is a series of indicators as explained in the documentation provided with the the software. This documentation explains how the indicators work together. The doc is based on the stand alone Mesa product (functionally the same, graphically more explicit).

My lack of success is perhaps due to the fact that I did not use the book relying only on the doc provided with the software: frankly an error on my part.

When ordering make sure that you get the latest release as I've gone through one upgrade.

I'm not sure about using the supplied dlls other than with NSDT - you should check with the supplier as to the possibility.

My first post here, so we'll see how it works.

I have had MESA for several years now, and haven't bothered to try it in the Trader. It still has problems even reading some of the data contracts I build. My opinion only, but I think it is a much hyped software that has very marginal usefullness. I have used cycle analysis for about twenty years now, and I think that this software has very imited value.

If anyone is interested in cycles, I would suggest reading James Gleik's book CHAOS. It is not specifically about markets, but there is a section in there that shows how cycles work, and why they are so difficult to use - especially to actually quantify.

Again, I haven't actually tried the MESA indicators in the Trader, and if someone does, I would be interested if they are indeed useful.

Re: MESA2002

Date :6/25/2003 11:20:35 AM Poster : Russ Koester

I do not have the experience that Kermit has but I also have not been able to use MESA.

I've had it for about a year, and it hasn't worked for me either. However, I feel I must be missing something, because R-MESA 3 has been on the top 10 list of Futures Truth for quite a while.

One way of using MESA which seems to have promise, doesn't seem possible to implement on NST. That is, using the length of the dominant cycle (or a fraction thereof) as the parameter for another indicator. If anyone knows how to do this in NST i'd be interested to know.

Adaptive indicators will achieve this task, you can use the length of the dominant cycle as an adaptor to adapt the underlying indicator.

Ward Systems have "Advanced Indicators Set 2" which contains an adaptive indicator called "Variable Length Moving Average".

You can download an adaptive version of the Mass Index for free on this forum, or buy a separate adaptive pack (Bowfort Adaptive Indicators 1) from me if you need more indicators.

In the indicators I've written, you don't have to worry about a fraction of the dominant cycle, as scaling is taken account of automatically.

I have tried out MESA even in it's stand-alone form. In my view, it is too simplistic. Even dominant cycles are hard to identify and measure because of non-linearities in the cycle process, and the Chaotic nature of cycles.The results of MESA look pretty, but don't bet your buck on them. Ehler's mathematical prowess is undeniable, but here we are trying to quantify things which cannot be quantified yet even with today's computer power.

Stochastic crossover

Date :6/4/2003 5:35:40 PM Poster : William

How to I program a trading strategy and/or prediction that goes long on a stochastic crossover from below 20 , and short on a stochastic crossover from above 80 ?

Re: Stochastic crossover

Date :6/5/2003 11:00:48 AM Poster : chris wong

i'd just use example 1 as a guide and change the average crossovers to plain crossover above and crossover below. one time series is the stochastic and the other is either 20 or 80.

On 6/4/2003 5:35:40 PM William wrote:

trading the equity curve

Date :6/7/2003 1:39:37 PM Poster : sylvain gauthier

It is logical that if we trade the long or short equity curve that is go long is the equity curve is growing (equity greater than moving average of equity or else) that we should get much better returns than not doing it. The perfect system should only trade valid prefiltered signals based on the past and current profitability of each subsystems.

Try an experiment :

1- build two simple trading systems : one for trending markets and the other for oscillating markets

2- Compute the long and short equity curves for each systems

3- Use the trading strategy wizard to go long if the long equity is growing and go short if the short equity curve is growing

4- Weird but you will get lower returns. Is it a bug or bad programming

5- Is there any other way to compute the filtered equity curves

6- Note that if you use the conditional cumulative sum you can get higher retruns but not with the trading strategy wizard. The cumulative sum will not comute the returns from the beginning of trading

7- Note also that the fuzzy indicators dont allow for a variable max. Real life that max is variable

I am expecting comments and suggestions before I consider that it is totally illogical to get lower returns when you avoid the biggest part of a drawdown.

8- It is possible to minimize the probabilty of ruin with NST and the optimal positions

Re: trading the equity curve

Date :6/11/2003 11:02:08 AM Poster : Bertrand

Hi Sylvain,

I intend to know what your are talking about. I was fascinated by the the same idea some time ago: use smart systems that automatically switch rules according to their own efficiency. I tried this out to the core programming a theoretically equity in TradeStation & also did this graphically to increase the confidence in the results.

But to my suprise it is really not working that good, because of the following: In order to lower drawdown through equity curve filtering the system should have a low serial correlation of trades. For a good, not curve fitted system that runs on more than one specific market and/or timeframe this should be the case.

With such an approach you get lower returns, because the system itself it not predicting a switch in rules, but is lagging in changing its behaviour. This means if market suddenly changes to another state, you will get a the high drawdown from the original rules until switching AND you will probrably miss the a big move until your system switches again (this is more important for a system that is designed to be completely inactive in DD phases).

I guess you could simply build a prediction to predict a moving average of the trading system equity curve & incorporate that as a filter into a second trading system (just make sure you have optimized the system before you take this step).

All the best
Bertrand

number of neurons used in hidden layer

Date :6/22/2003 11:06:45 PM Poster : Ren Yu

I wanna test and compare the predicted accuracy of using different number of neurons in the hidden layer. However, when I use the prediction wizard, it automatically optimizes the number for me. What should I do? When I open the 'add prediction' window, after choosing 'No optimization', what should i choose in the 'Training criteria -- Advanced -- Training parameters'? If I choose the 'Maximum number of hidden neurons during training' to be 20, does it mean that the training result is the result of using only 20 neurons in the layer? Anyone can help me? Thanks a lot!

about interest rate

Date :6/23/2003 8:09:12 AM Poster : Ren Yu

I wanna include the interest rate as an input in my prediction. However, I do not know where to get the interest rate for the last ten years. Is it included in the CD-ROM with the software? Anyone can help me?
Also, for the exchange rate, I am not familiar with the abbreviations. In what way I could know which abbreviation corresponding to which exchange rate?
Thanks a lot!

Regards
Ren Yu

Re: about interest rate

Date :6/24/2003 9:46:20 AM Poster : Maxwell Craven

There are all kinds of interest rates. There are treasury bills, treasury bonds, prime interest rate, federal funds rate, certificate of deposit rates, etc. All the ones I just mentioned are loaded on the hard drive in the indexes category. Plus every country has their own central bank rates, but they may not be distributed by Ward - I don't know that for sure.

Using one trading strategy as input to another

Date :6/23/2003 5:10:56 PM Poster : Maciej

Has anyone tried using the entry signals generated by one trading strategy as input into a second strategy, ie "trading strategy Long Entry Order#1" as the indicator in trading strategy #2?

I use this to separate the entries from my stops, the first trading strategy generates all the entries, whilst the second optimizes only the stops. Its my way of avoiding the entries being influenced by the the stops during optimization.
Would you agree that the number of entries should be identical in both trading strategies and only the exits would differ?
Perhaps there is another way of doing this ie having stops that won't influence the optimiser:- if anyone can advise?

Re: Using one trading strategy as input to another

Date :6/24/2003 9:27:16 AM Poster : Maxwell Craven

I don't think I'd agree that the entries would be identical. If the exits differ, then the next entries could differ too. If you don't really want to optimize stops I guess you could set your min max values tight for the stop indicators so they don't optimize.

change the prediction objective

Date :6/28/2003 5:17:33 AM Poster : Ren Yu

I run some experiments to compare the prediction ability of traditional backpropagation neural network and NeuroShell Trader network. I could change the prediction goal for example, I could set the training goal is MES = 0.05. However, for NeuroShell Trader, I could not do the same thing. I could only set my prediction object to 'minimize MSE', however, the prediction result shows that the training error is 0.8. What should I do if I wanna get a smaller value for this 'training error'? Can I set it somewhere? Does it mean that this is the smallest MSE value I could get by using the Trader?
Thanks!

Re: change the prediction objective

Date :7/2/2003 8:52:20 AM Poster : Ward.net Webmaster

The best way to reduce prediction error is to make sure the number of hidden neurons is set to the maximum of 80, buth for training and optimization. However, the best prediction error doesn't always result in the best generalizing nets. If you overfit the training, the net won't predict well into the future unless you have darn relevant inputs, something pretty hard to find for financial market prediction. For that reason, NeuroShell Trader (unlike our other software) is not set up internally to make the absolute tightest fits possible, even with 80 hidden neurons. It is set up to generalize well internally. It is always a mistake to judge nets by training error, in scientific models.

Interface of NST 4.0 to Trade Station

Date :6/30/2003 2:42:38 PM Poster : Rick D

I am looking forward to using NST 4.0. I have a few questions regarding using
NST4.0 with Trade Station 7:

1) Can I feed indicators generated intraday in TS7 to NST4.0?
2) Can I do the reverse of the above?
3) Can I use the TradeStation data feed as a data feed to NST4.0?

Thanks,
Rick D.

Re: Interface of NST 4.0 to Trade Station

Date :6/30/2003 3:10:05 PM Poster : Ward.net Webmaster

Here are the answers to your questions:

1. Yes, the datastreams generated by your indicators can be sent to NeuroShell as long as they are not somehow locked in TradeStation. Of course you can't optimize them with parameter search in NeuroShell, since only the indicator outputs are coming over.

2. Yes, you can send datastreams back over, but you will get to them in TS as functions.

3. Yes, if you build a 1 minute chart in TS, then use our export indicators, your NeuroShell chart will be updated in real time. That is because open, high, low, close, and volume come over automatically as well as any of your indicators. So you should not need another data feed. BUT we have to emphasize that not everyone should consider using TS instead of another real time feed, because you have to run one TS chart and insert the export indicator into it for each NeuroShell chart you bring up. That will be a real pain if you want to trade more than say a dozen issues, not to mention the added overhead of having both TS and NeuroShell up at once on the same machine. Better to take a look at a lower priced feed now supported - Prophet.net.

Re: NS 4.0 Import/Export compatible with DataXApi?

Date :7/10/2003 11:37:54 AM Poster : Ward.net Webmaster

No, the data pump does not replace Data Exchange addon. It does NOT export anything, and the DataX does not import very well because it was mainly designed to export. The DataPump is only for implementing you own data feed in case you don't want Quote.com, eSignal, or Prophet.net. DataX was designed mainly for sending trades to your broker.

On 7/7/2003 9:03:07 PM Mark Skiba wrote:

Trade Station-7 and NS-4.0

Date :7/2/2003 12:17:54 AM Poster : Tom Fox

What is the best method for live time and end of day, both programs on one computer or network two computers? Thank you.

Tom

Re: Trade Station-7 and NS-4.0

Date :7/2/2003 8:39:41 AM Poster : Ward.net Webmaster

It would be great if NeuroShell would "talk" to TradeStation on a different computer through a network, but unfortunately that isn't an option in 4.0. We had a hard enough time getting TS just to talk at all, because it wasn't set up for that. You'll need to run both systems on the same computer, so it should be a fairly big and fast one. Of course if you are really only interested in end of day, you could just export data from TS in a text file and then move it to another computer for NeuroShell to read, but that isn't a viable option for intraday.

NS 3.8 add on indicators

Date :7/7/2003 4:45:49 PM Poster : Tom Fox

I have put NS 4.0 on the same computer as TS 7 This is not the same computer as NS3.8, may I use the add on indicators I bought for 3.8 with NS 4.0, and if yes how do I install in NS 4.0 ? Thank you.

Tom

Re: NS 3.8 add on indicators

Date :7/10/2003 11:34:39 AM Poster : Ward.net webmaster

Yes, you can install the add-on indicators into 4.0. Remember that 3.8 and below was stored in a folder called "NeuroShell Trader". The default for 4.0 is called "NeuroShell Trader 4.0". So you have to make sure the addons install folder is NeuroShell Trader 4.0. The install wizard lets you change that install folder.

Predictions based on multiple time frames

Date :7/7/2003 9:08:29 PM Poster : Mark Skiba

There had been some discussion about the possibility of allowing input from multiple time frames. For example, a predictor at a daily chart level as input to buy in an intraday chart. Did this make it into 4.0?

Re: Predictions based on multiple time frames

Date :7/9/2003 5:21:35 PM Poster : Steven Buss

I have developed an add-on for NeuroShell Trader and NeuroShell Day Trader which provides this capability. Among other things, the add-on provides for optimizing the "bar size" of larger timeframes for more than 300 indicators.

NST-MTI major features and the NST-MTI User Guide can be viewed at http://www.emmetropia.com/products/.

On 7/7/2003 9:08:29 PM Mark Skiba wrote:

Re: Predictions based on multiple time frames

Date :7/30/2003 11:58:22 PM Poster : sylvain gauthier

There is add-on that does that work. Still I believe that it should come free of charge with NST Real time. There is a way around, just think about it.

There are major improvements that should be done to NST and I think I am extremely good in conceiving them.

NST is unable to do money management and position sizing. It should be able to compute the optimal capital to risk, the size of positions and optimize in real time.
It is well know that 90% of a good trading system is based on money management and position sizing. If we follow the big guys, guys who made a real lot of money like the Turtle Traders and the ideas developped by Tharp we reach the conclusion that position sizing is paramount. A Trading strartegy is non linear function like in the probability of ruin theorem (an objective that should be minimized in NST) of capital at risk, average win to average loss ratio and precision. NST should be able to find the optimal objective function and that could explain why development time can be so long.

When we track a missile we dont have to know where it was 10 minutes ago: we need to know where it will be in 5 nanosecond. Quote.com provide the tick by tick data still NST does load the tick data , the trades, the bid ask data so important for a real trader. I simply cannot understand. Nothing is perfect but the pro needs that info

It is also impossible to attribute a weight based on profitability to sets of specific strategies or indicators. There is no direct and automated connection with brokerage firms and no email alerts.

NST should be able to switch automatically gradually or rapidly from one strategy to another and recognize in real time what should be the optimal strategy, combination of strategies or indicators to trade with real time and continuous optimization. We have powerful machines and that is not a problem anymore.

In theory the wavelets indicators and fuzzy indicators should give the best results. Still we dont have any examples and the fuzzy indicators are limited by a fixed maximum non adaptive constraint.

Steve Ward did a beautiful job when he optimized the strategy using a balancing constraint. That should be done with neural nets. It has been proven again and gain that we should use the same number of observations by bins to get an accurate prediction or classification. Still NST destroy the sample by chopping it. Therefore the few real inportant big swings or rare cases will not be detected. There are destroyed in the training set

I am still a strong believer.

Desired new NST features including Position Sizing

Date :8/1/2003 11:27:37 PM Poster : Steve in California

I thought Silvain's thoughts below were interesting in several ways and thought I'd respond with thoughts about two points.

He wrote:

"There are major improvements that should be done to NST and I think I am extremely good in conceiving them." He then goes on to list several improvements, almost all also I think would be great.

The problem with these desires, of course, is money… I use Tradestation as well as NSDT. And, as some of you may know, in the last couple years, this leading vendor of trading platforms changed it's approach to licensing of it's product. Earlier, it had made a sale to a customer and then the customer received updates from that point forward for free. Now, I get a monthly credit card charge for use of it's product.

Ward Systems Group operates on the basis of that 1 time charge policy. All of us have the opportunity to upgrade to Release 4 without charge. So, how does WSG finance new features for the product? Well, it must continually sell to new customers. So, economic necessity dictates that new product features must focus on features that might be significant to new customers and not to folks who have been using the product for awhile.

But then we're all upset (including me) that WSG doesn't make the improvements we want fast enough.

My pet peeve (that I've posted about before) is that NST doesn't provide for user programming of the objective function which the product optimizes against.

The caveat on taking my view of these matters seriously is, of course, that I'm the developer of the NST Multiple Timeframe Indicator add-on.

Here's the gem in my note…

With regard to improvements for money management and position sizing: Like I said, I have Tradestation and it certainly has more flexibility than does NSDT related to these issues.

But the truth is, it STILL doesn't have features which are good enough…
Specifically, it doesn't support rigorous Monte Carlo simulation using multiple trading strategies. To get that you have to purchase other products.

The most terrific tool for position sizing that I've ever seen can also be made to work with NST and only costs $37. Take a good look at "Prosizer" at http://unicorn.us.com/trading/prosizer.html. After having used Prosizer, I'll never write code again to optimize the size of a position within a tool like NST or Tradestation. I've got Prosizer now.

And by the way, the developer of Prosizer is a fan of Tharp in a couple different ways and provides support in Prosizer for the position sizing strategies argued for by Tharp in addition to the usual suspects (i.e., fixed fractional and fixed ratio).

On 7/30/2003 11:58:22 PM sylvain gauthier wrote:
There is add-on that does that work. Still I believe that it should come free of charge with NST Real time. There is a way around, just think about it.

There are major improvements that should be done to NST and I think I am extremely good in conceiving them.

NST is unable to do money management and position sizing. It should be able to compute the optimal capital to risk, the size of positions and optimize in real time.
It is well know that 90% of a good trading system is based on money management and position sizing. If we follow the big guys, guys who made a real lot of money like the Turtle Traders and the ideas developped by Tharp we reach the conclusion that position sizing is paramount. A Trading strartegy is non linear function like in the probability of ruin theorem (an objective that should be minimized in NST) of capital at risk, average win to average loss ratio and precision. NST should be able to find the optimal objective function and that could explain why development time can be so long.

When we track a missile we dont have to know where it was 10 minutes ago: we need to know where it will be in 5 nanosecond. Quote.com provide the tick by tick data still NST does load the tick data , the trades, the bid ask data so important for a real trader. I simply cannot understand. Nothing is perfect but the pro needs that info

It is also impossible to attribute a weight based on profitability to sets of specific strategies or indicators. There is no direct and automated connection with brokerage firms and no email alerts.

NST should be able to switch automatically gradually or rapidly from one strategy to another and recognize in real time what should be the optimal strategy, combination of strategies or indicators to trade with real time and continuous optimization. We have powerful machines and that is not a problem anymore.

In theory the wavelets indicators and fuzzy indicators should give the best results. Still we dont have any examples and the fuzzy indicators are limited by a fixed maximum non adaptive constraint.

Steve Ward did a beautiful job when he optimized the strategy using a balancing constraint. That should be done with neural nets. It has been proven again and gain that we should use the same number of observations by bins to get an accurate prediction or classification. Still NST destroy the sample by chopping it. Therefore the few real inportant big swings or rare cases will not be detected. There are destroyed in the training set

I am still a strong believer.

Re: Desired new NST features including Position Sizing

Date :8/2/2003 4:24:48 PM Poster : Maciej

Interesting thoughts from both Steve and Sylvain. I for one would really welcome variables as inputs to functions in a future release. I use CFB and Mesa and indicators such as CFB or Dominant cycles cannopt be used as inputs to other NSDT indicators - a real pity as that complicates life unnecessarily ("limited by a fixed maximum non adaptive constraint").

The problem with these desires, of course, is money… I use Tradestation as well as NSDT. And, as some of you may know, in the last couple years, this leading vendor of trading platforms changed it's approach to licensing of it's product. Earlier, it had made a sale to a customer and then the customer received updates from that point forward for free. Now, I get a monthly credit card charge for use of it's product.

Ward Systems Group operates on the basis of that 1 time charge policy. All of us have the opportunity to upgrade to Release 4 without charge. So, how does WSG finance new features for the product? Well, it must continually sell to new customers. So, economic necessity dictates that new product features must focus on features that might be significant to new customers and not to folks who have been using the product for awhile.

But then we're all upset (including me) that WSG doesn't make the improvements we want fast enough.

My pet peeve (that I've posted about before) is that NST doesn't provide for user programming of the objective function which the product optimizes against.

The caveat on taking my view of these matters seriously is, of course, that I'm the developer of the NST Multiple Timeframe Indicator add-on.

As a former programmer myself (now retired), I can tell you for sure it is never possible to keep users happy no matter how much you program. I really think Ward Systems did a darn good job with the dozens of features they added to 4.0. However, as long as we're starting a new wish list, I'll put my 2 cents worth in. I'd like to see trades automatically sent to my broker. I'll bet that would be the number one choice of a lot of people these days. Anyway, drawing on my extensive experience I can assure Ward Systems that pressing user needs are not a sign of failure but of a healthy and happy user population.

Respond to three in one go ...

Xprogrammer:

Would standard "FIX 4.2 connectivity" potentially be of interest? I am *this* close to finishing a DLL which accomplishes that task ... am unsure whether FIX is more at an institutional level than at "ebrokers" or not ... half tempted to consider marketing it later in the year.

SteveinCA:

There are numerous very good montecarlo kits in circulation (MBRA or something like that is one) which are relatively cheap and allow 90 days evaluation or similar. They are all generally C or C++ with XLA/XLL declarations to guide one with for invocation efforts or wrapping within another structure. Regarding position sizing/portfolio balancing, I have linked NSDTP with S+ which is a statistics package that is either cmdline language driven or GUI based depending on how much or little custom effort you need [has something like 700 standard stat tests/modelling/etc off menus] and it has unbelievable power. Is/was used by FermiLabs & Argonne Labs for particle physics and supercollider analysis, originally designed by the famous boys at Bell Labs back in the early 80s when they were THE place to be for serious thinking ... do a google on S-Plus and/or NuOpt) ... I find its power and flexibility are quite useful. Given that I've basically linked a programmable trading system to a programmable analysis/statistics system its arguably more than a bit of overkill, but one can slice and dice timeseries much simpler in a true data analysis environment and it adds another whole layer of insight to our efforts.

Sylvain:

While I agree that some of your ideas would be of interest to me, I for one do not expect Ward to continue the quick expansion and growth of the product's abilities without increasing their userbase by some suitable multiple. Efforts like the "dumbing down" of the menus/options unless you re-enable them and such are efforts Ward must undertake towards this end, which unfortunately lessen the amount of time/effort to put towards new features/functionality. I have in the end elected to buy a copy of PowerBasic 7.02 and to date have written a handful of things (so far) which NSDTP has lacked that we have needed, which may or may not lead to my marketing/licensing certain things I've drawn up in the future.

I can assure you that the menu effort wasn't even .001% of the total effort that went into release 4.0. Anyway, we have no further "dumbing down" enhancements contemplated. So as soon as we take care of all lingering problems with 4.0 we should be developing again. But we applaud your use of PowerBasic. Knowing that we could not possibly supply all the functionality everyone wants, we implemented the ability you are using to code your own systems with PowerBasic or C or Delphi. That's why TradeStation has an Easy Language, because as large as they are, they can't keep up with the demand either. We just chose to use standard programming languages instead of inventing our own.

I can assure you that the menu effort wasn't even .001% of the total effort that went into release 4.0. Anyway, we have no further "dumbing down" enhancements contemplated. So as soon as we take care of all lingering problems with 4.0 we should be developing again. But we applaud your use of PowerBasic. Knowing that we could not possibly supply all the functionality everyone wants, we implemented the ability you are using to code your own systems with PowerBasic or C or Delphi. That's why TradeStation has an Easy Language, because as large as they are, they can't keep up with the demand either. We just chose to use standard programming languages instead of inventing our own.

Would standard "FIX 4.2 connectivity" potentially be of interest? I am *this* close to finishing a DLL which accomplishes that task ... am unsure whether FIX is more at an institutional level than at "ebrokers" or not ... half tempted to consider marketing it later in the year.

SteveinCA:

There are numerous very good montecarlo kits in circulation (MBRA or something like that is one) which are relatively cheap and allow 90 days evaluation or similar. They are all generally C or C++ with XLA/XLL declarations to guide one with for invocation efforts or wrapping within another structure. Regarding position sizing/portfolio balancing, I have linked NSDTP with S+ which is a statistics package that is either cmdline language driven or GUI based depending on how much or little custom effort you need [has something like 700 standard stat tests/modelling/etc off menus] and it has unbelievable power. Is/was used by FermiLabs & Argonne Labs for particle physics and supercollider analysis, originally designed by the famous boys at Bell Labs back in the early 80s when they were THE place to be for serious thinking ... do a google on S-Plus and/or NuOpt) ... I find its power and flexibility are quite useful. Given that I've basically linked a programmable trading system to a programmable analysis/statistics system its arguably more than a bit of overkill, but one can slice and dice timeseries much simpler in a true data analysis environment and it adds another whole layer of insight to our efforts.

Sylvain:

While I agree that some of your ideas would be of interest to me, I for one do not expect Ward to continue the quick expansion and growth of the product's abilities without increasing their userbase by some suitable multiple. Efforts like the "dumbing down" of the menus/options unless you re-enable them and such are efforts Ward must undertake towards this end, which unfortunately lessen the amount of time/effort to put towards new features/functionality. I have in the end elected to buy a copy of PowerBasic 7.02 and to date have written a handful of things (so far) which NSDTP has lacked that we have needed, which may or may not lead to my marketing/licensing certain things I've drawn up in the future.

On 8/3/2003 9:01:07 AM Xprogrammer wrote:
As a former programmer myself (now retired), I can tell you for sure it is never possible to keep users happy no matter how much you program. I really think Ward Systems did a darn good job with the dozens of features they added to 4.0. However, as long as we're starting a new wish list, I'll put my 2 cents worth in. I'd like to see trades automatically sent to my broker. I'll bet that would be the number one choice of a lot of people these days. Anyway, drawing on my extensive experience I can assure Ward Systems that pressing user needs are not a sign of failure but of a healthy and happy user population.

On 8/1/2003 11:27:37 PM Steve in California wrote:
I thought Silvain's thoughts below were interesting in several ways and thought I'd respond with thoughts about two points.

He wrote:

"There are major improvements that should be done to NST and I think I am extremely good in conceiving them." He then goes on to list several improvements, almost all also I think would be great.

The problem with these desires, of course, is money… I use Tradestation as well as NSDT. And, as some of you may know, in the last couple years, this leading vendor of trading platforms changed it's approach to licensing of it's product. Earlier, it had made a sale to a customer and then the customer received updates from that point forward for free. Now, I get a monthly credit card charge for use of it's product.

Ward Systems Group operates on the basis of that 1 time charge policy. All of us have the opportunity to upgrade to Release 4 without charge. So, how does WSG finance new features for the product? Well, it must continually sell to new customers. So, economic necessity dictates that new product features must focus on features that might be significant to new customers and not to folks who have been using the product for awhile.

But then we're all upset (including me) that WSG doesn't make the improvements we want fast enough.

My pet peeve (that I've posted about before) is that NST doesn't provide for user programming of the objective function which the product optimizes against.

The caveat on taking my view of these matters seriously is, of course, that I'm the developer of the NST Multiple Timeframe Indicator add-on.

Here's the gem in my note…

With regard to improvements for money management and position sizing: Like I said, I have Tradestation and it certainly has more flexibility than does NSDT related to these issues.

But the truth is, it STILL doesn't have features which are good enough…
Specifically, it doesn't support rigorous Monte Carlo simulation using multiple trading strategies. To get that you have to purchase other products.

The most terrific tool for position sizing that I've ever seen can also be made to work with NST and only costs $37. Take a good look at "Prosizer" at http://unicorn.us.com/trading/prosizer.html. After having used Prosizer, I'll never write code again to optimize the size of a position within a tool like NST or Tradestation. I've got Prosizer now.

And by the way, the developer of Prosizer is a fan of Tharp in a couple different ways and provides support in Prosizer for the position sizing strategies argued for by Tharp in addition to the usual suspects (i.e., fixed fractional and fixed ratio).

On 7/30/2003 11:58:22 PM sylvain gauthier wrote:
There is add-on that does that work. Still I believe that it should come free of charge with NST Real time. There is a way around, just think about it.

There are major improvements that should be done to NST and I think I am extremely good in conceiving them.

NST is unable to do money management and position sizing. It should be able to compute the optimal capital to risk, the size of positions and optimize in real time.
It is well know that 90% of a good trading system is based on money management and position sizing. If we follow the big guys, guys who made a real lot of money like the Turtle Traders and the ideas developped by Tharp we reach the conclusion that position sizing is paramount. A Trading strategy is non linear function like in the probability of ruin theorem (an objective that should be minimized in NST) of capital at risk, average win to average loss ratio and precision. NST should be able to find the optimal objective function and that could explain why development time can be so long.

When we track a missile we dont have to know where it was 10 minutes ago: we need to know where it will be in 5 nanosecond. Quote.com provide the tick by tick data still NST does load the tick data , the trades, the bid ask data so important for a real trader. I simply cannot understand. Nothing is perfect but the pro needs that info

It is also impossible to attribute a weight based on profitability to sets of specific strategies or indicators. There is no direct and automated connection with brokerage firms and no email alerts.

NST should be able to switch automatically gradually or rapidly from one strategy to another and recognize in real time what should be the optimal strategy, combination of strategies or indicators to trade with real time and continuous optimization. We have powerful machines and that is not a problem anymore.

In theory the wavelets indicators and fuzzy indicators should give the best results. Still we dont have any examples and the fuzzy indicators are limited by a fixed maximum non adaptive constraint.

Steve Ward did a beautiful job when he optimized the strategy using a balancing constraint. That should be done with neural nets. It has been proven again and gain that we should use the same number of observations by bins to get an accurate prediction or classification. Still NST destroy the sample by chopping it. Therefore the few real inportant big swings or rare cases will not be detected. There are destroyed in the training set

I am still a strong believer.

I'm not an expert, but it seems like retail FIX access is slowly percolating down, as more individuals go the automated trading route. I know that @ IB, with $1500 in commissions a month (300+ ES/YM round trips) you qualify for a leased line and FIX access. I'm not sure I can imagine needing it, but it definitely seems 'safer' to plug in on a standards basis opposed to proprietary api.

I know there are a couple of NSDTP-> IB TWS interfaces out there, but only one of them seems to be for sale (source only) and it's written in VB.

Maybe Steve Ward can give you a better idea about the institutional user base of NS, and how marketable a FIX solution would be.

Regards,
John Ferguson

es #f (Emini SP continous contracts - Esignal)

Date :7/10/2003 7:31:03 PM Poster : JLF

I cannot get es #f to load anylonger via Esignal. Anyone have any suggestions?

Re: es #f (Emini SP continous contracts - Esignal)

Date :7/11/2003 9:05:24 AM Poster : Ward.net Webmaster

We loaded it this morning with no problem. Try ES #F instead of es #f. Although we loaded without CME being checked you can try checking it if you didn't already. By the way, in our trading we always use ES #F=2 which omits overnight in case anyone else wants to use a continuous emini without overnight, which ES #F includes.

Initial Comments about NeuroShell Trader Professional 4.0

Date :7/11/2003 6:57:20 PM Poster : Rob

I received the software yesterday and I'd like to share my experience with everyone.

1. I was very surprised that the product does not ship with a printed manual. For $1400 I expected that. Sure I can print the manual out, but who wants to spend all afternoon doing that?

2. Most of the sample charts do not load on my system. I get an error informing me that the data cannot be found. Every chart I tried had this problem. I am running Windows 2000 professional (SP4). The specs are an Athlon 1.4 with 512 MB RAM.

3. Several of the videos are missing. There are three related to using TradeStation data and they are not found on the Installation and Video CD.

4. I When I select the Data Sources option, and then select the Direcories/Files tab, using the option Auto Scan crashes the program. It starts but then at some point the program stops responding.

5. I watched the videos that were on the CD but I must say I am still at a loss where to begin the process. I think the training videos are on the shallow side. I can do everything covered in the videos, but I still have no foundation on how to construct a quality neural net. For example, I am trying to build a trading system for the Nasdaq 100. I'd like to test intermarket data for bonds, S&P, oil, US dollar, etc. I create a new chart and select that index to graph. Here are some questions that come to mind:

a. Should I insert an indicator first, or is it more important to test the prediction using intermarket data for relevancy first?

b. Should I test the intermarket data (using insert prediction) one at a time or combine them all together first? What I mean is, should I put the US Dollar, the S&P 500 and bond intermarket data into the prediction in one shot, or should I test them individually against the Nasdaq 100?

6. This message board is really bad. Possibly the worst one I've seen in a few years. With very high quality FREE boards like Invision Power Board available, there is really no excuse for this. Again, the price is free and the product is awesome. My impression of Ward Systems Group dropped several notches when I saw this board. It really does impact the customer's perception of your company.

I hope this post doesn't come off as too critical of the program. I know I am a newbie and there is an excellent chance there is a good explanation for most of my questions. I am sure that not being able to load the samples didn't help one bit. But what I am trying to do is point out the newbie view of the process. The experience could be improved considerably, and I hope my feedback helps.

Re: Initial Comments about NeuroShell Trader Professional 4.0

Date :7/12/2003 2:28:18 PM Poster : Ward.net Webmaster

We do not recommend testing neural net inputs one at a time. A single input will not build a good model. On the other hand, dozens of inputs will build an unrealistically good model, because you will inevitably "overfit". It is best to use only a handful at a time. Indicators applied to the raw data (including intermarket) are almost always preferable to using the raw data itself. You can use the contribution factors to decide which are best, and later you will probably be using the optimizer.

Regarding the example charts, the program ships with the example directories mapped and ready to go. We suspect that the autoscan problem or your efforts to map directories have caused the example directory to become unmapped. In any case, you should contact technical support if you really want to get help with the autoscan problem - that is an individual problem that can't be investigated on the forum.

Regarding the videos, you received our new release 4.0 in the first week of shipment, and yes, we just found out that some TradeStation videos won't play. With any new release there are bound to be some problems, and frankly we are thankful that the missing videos are really among the worst problems found so far. We'll see that you get the videos if they aren't on the CD or a way to play them if they are in some other folder.

We realize there are some like you who much prefer manuals than videos or calling for support, but to keep bringing you the latest software, the documentation has to be electronic. For years we printed manuals, spending many thousands reprinting with each new release and throwing away manuals from the last release. Of course, only about 5% of users read the manuals - the rest just called technical support. So we beefed up our technical support capability and went to the videos and the help file reference instead. We note that we aren't alone with respect to manuals - we can't remember the last time we got a manual with even a Microsoft product. In order to get timely updates out, printed manuals for software are going the way of attendants cleaning your windshield when you fill up with gas, we are sad to say.

Regarding the message board, we know it could be improved, but there is a wealth of good information in these old posts that will cost us a great deal of time to convert. Perhaps we'll convert to a better system when we have taken care of some of the backlog of user requests for more software features. In the mean time, we hope you will judge us on our software and support rather than the forum interface.

Thanks for the comments. I can understand your issue with printing a complete manual. But may I suggest a QuickStart guide with one or two good examples. Something that focuses the newbie and helps overcome the initial learning curve.

I am becoming more familiar with the process, mainly because I bought the book "Neural Networks for Financial Forecasting" by Edward Gately. I also bought Jurik's book on Neural Networks. They are helping.

Thanks

Going into production...

Date :7/12/2003 3:40:03 PM Poster : JLF

How do you know you are ready to go with a model?

Re: Going into production...

Date :7/14/2003 1:49:34 AM Poster : Nalin Pasricha

I usually run two kinds of tests before putting a model into production.

The first is to run the model on a different period of time than the one used to develop the model. For instance if I have developed a model using the time period July 2001 to June 2003 as the out of sample period then i'd also test it on, say, July 1999 to June 2000. This is because while developing a system, many of us do repeated runs on the same out of sample period with small changes to the system --inadvertently turning our 'out of sample' period into an 'in sample' period.

The other test is to see whether the model runs on issues besides the one for which the model was developed. For instance, if the model has been developed for the S&P 500, I'd also check to see if it worked on the Nikkei (without further optimization).

I just follow the advice I got from Steve Ward, it may have been from the advanced class, I don't rememeber. He said look for buy signs near valleys and sell signs near peaks and then go trade. That seems to work for me, except I'd add make sure the trading frequency looks appropriate for what you like.

are Jurik Indicators working in NSDTP 4.0?

Date :7/13/2003 4:53:24 PM Poster : Steve K

I just noticed that my Jurik indicators aren't working here -- JMA plots but it isn't smoothed, RSX & VEL are flat lines, CFB gives an error message

I recently built a new machine and upgraded to XP-PRO so I received a new installation code from Jurik and installed it to the template directory without any problems however the indicators don't work

I'm not sure if this is a bug in NSDTP 4.0 or if Jurik has some problems installing & activating on XP-PRO machines -- Bowfort's jurik based indicators won't plot either

Anyone else have this problem? or know how to resolve it?

BTW, I think Ward did a great job on this release -- I especially like the variable linking -- very well done guys!!

thx, Steve

Re: are Jurik Indicators working in NSDTP 4.0?

Date :7/14/2003 9:07:40 AM Poster : Maciej

I had the same problem but it now works- in my case it was due to an upgraded bios that necessitated a new Jurik code.

On 7/13/2003 4:53:24 PM Steve K wrote:
I just noticed that my Jurik indicators aren't working here -- JMA plots but it isn't smoothed, RSX & VEL are flat lines, CFB gives an error message

I recently built a new machine and upgraded to XP-PRO so I received a new installation code from Jurik and installed it to the template directory without any problems however the indicators don't work

I'm not sure if this is a bug in NSDTP 4.0 or if Jurik has some problems installing & activating on XP-PRO machines -- Bowfort's jurik based indicators won't plot either

Anyone else have this problem? or know how to resolve it?

BTW, I think Ward did a great job on this release -- I especially like the variable linking -- very well done guys!!

thx, Steve

Hi Steve,

I can't answer to the other ones, but I can answer to mine.

When upgrading from NST 3.8 to NST 4.0 (and this applies to any of the software from Bowfort. Deinstall the add-on (from the control panel / Add/Remove Programs. Now reinstall the add-on, but when prompted during installation,
change the:

X:\Neuroshell Trader

to

X:\Neuroshell Trader 4

Where "X" is the letter for the drive that you installed Neuroshell on. (normally C).

You need to do this, because the folder name for Neuroshell has changed with the release of 4.0 (so you can still run the old version).

If it doesn't plot after that, it's highly likely that the Jurik DLL's themselves aren't properly installed or licensed on your machine. If you move machines, upgrade bios (and maybe if you upgrade the OS), Jurik's DLL's will need a new license key from Jurik Research.

I run the Jurik DLL's under XP Pro and NST 4.0 with the Bowfort ZJurik add-on, and haven't encountered any problems, so I don't think your licensing problem
is due to XP-Pro.

We support all our products (free included). So if you're still having problems after speaking to Jurik about the licensing, please contact me via the website.:

Hi Zawie,

I uninstalled your indicators then reinstalled them, I also reinstalled Jurik and it looks like everything is working once again

thx for your help!!

Steve

Re: are Jurik Indicators working in NSDTP 4.0?

Date :7/15/2003 11:32:53 AM Poster : MFK

An additional question about third-party add-ons and the upgrade to NST 4.0:

I use a number of third-party add-ons (Jurik, Bowfort, Cornice). While taking part in the beta test of 4.0, I also kept NST 3.5 running to keep track of working nets. During this period, I had no problem running the third-party add-ons on 4.0. Now, with the release version 4.0 installed, I was about to uninstall 3.5. Will doing that cause the third-party add-ons to stop working in 4.0? Or have their operating instructions somehow "migrated" to 4.0 during the months of successful use during the beta test?

Thanks.

Re: are Jurik Indicators working in NSDTP 4.0?

Date :7/15/2003 2:23:04 PM Poster : Ward.net Webmaster

If you loaded into 4.0 a 3.8 chart with custom indicators in it, the .tpl files will get stored in the 4.0 template folder. This is the only "migration" that will occur we believe. BUT, there may be DLLs somewhere that are needed. We store our addon DLLs in the template folder too, but Jurik probably doesn't. So our DLLs would

have to be moved to 4.0, but Juriks probably not. In the end, the safest thing to do is uninstall any addon and reinstall it again in the 4.0 folder (assuming it asks for the NeuroShell folder as our addons do - we can't speak for the addons from others).

Ah, you make it sound so simple! But if you're not a real computer person (a category in which I place myself) all this uninstall/reinstall business is a little confusing. The uninstall part I understand . . . Start, Settings, etc. But--and here I reveal my ignorance--where does the add-on program uninstall to? And how will I know where to locate these add-ons when I go to reinstall them in 4.0? The original setup files? Some are on disks; those I can find. But some were downloaded off the web. Somewhere in the digital bowels of my computer those original setup files must exist, acting as beneficial bacteria as it were. But, wow, finding them? Maybe you can help me with a little Update Maintenance 101 guidelines.

Thanks.

A program uninstalls into the bit bucket. You will need the original distribution files to reinstall the program.

Update Maintenance 101 - the very basics

I have been in your position in the past and reinstalling each piece of software becomes its own research project if you did not keep track of all of the pieces. I had to become very disciplined about keeping detailed records of software purchases. Here are some suggestions for the future:

Every Software Application / Add On gets a physical file folder. Software CD's or disks, purchase receipts, password codes, installation instructions, etc go into the folder.

If the software is downloaded, I try not to just download and install in one operation. First I download the file to its own hard disk folder such as C:/downloads/wardsystems/NSDTP40. Then I will install the program from this location. To be safe, you should back this up on a CD for your physical file folder. Any emails from the vendor I print and put in the physical file folder.

Then when it comes time to reinstall things, you will have everything. I purchased a new desktop and notebook this spring and using this process, I was able to reinstall everything. It takes a little extra time up front, but if you are depending on your trading applications to make money, I believe it is worth it.

Good luck.

Mike Begley

Re: are Jurik Indicators working in NSDTP 4.0?

Date :7/16/2003 9:58:52 AM Poster : Ward.net Webmaster

Remember you don't have to delete the 3.5 folder. You have the option to just install 4.0 on top of the beta (ie, in the same folder after you uninstall the beta) and stop using 3.5. If your addons worked in the beta they should work in 4.0, and if you think they reference something in the 3.5 folder, then just leave it there.

If the software is downloaded, I try not to just download and install in one operation. First I download the file to its own hard disk folder such as C:/downloads/wardsystems/NSDTP40. Then I will install the program from this location. To be safe, you should back this up on a CD for your physical file folder. Any emails from the vendor I print and put in the physical file folder.

Then when it comes time to reinstall things, you will have everything. I purchased a new desktop and notebook this spring and using this process, I was able to reinstall everything. It takes a little extra time up front, but if you are depending on your trading applications to make money, I believe it is worth it.

Good luck.

Mike Begley

Hi Steve,

I can't answer to the other ones, but I can answer to mine.

When upgrading from NST 3.8 to NST 4.0 (and this applies to any of the software from Bowfort. Deinstall the add-on (from the control panel / Add/Remove Programs. Now reinstall the add-on, but when prompted during installation,
change the:

X:\Neuroshell Trader

to

X:\Neuroshell Trader 4

Where "X" is the letter for the drive that you installed Neuroshell on. (normally C).

You need to do this, because the folder name for Neuroshell has changed with the release of 4.0 (so you can still run the old version).

If it doesn't plot after that, it's highly likely that the Jurik DLL's themselves aren't properly installed or licensed on your machine. If you move machines, upgrade bios (and maybe if you upgrade the OS), Jurik's DLL's will need a new license key from Jurik Research.

I run the Jurik DLL's under XP Pro and NST 4.0 with the Bowfort ZJurik add-on, and haven't encountered any problems, so I don't think your licensing problem
is due to XP-Pro.

We support all our products (free included). So if you're still having problems after speaking to Jurik about the licensing, please contact me via the website.:

Re: are Jurik Indicators working in NSDTP 4.0?

Date :7/16/2003 10:25:32 AM Poster : John Gotwals

On my system the Jurik DLL is a file with the name JRS_32.DLL, and it is stored in the d:\WINDOWS\system32 folder (On your machine the volume d: may be different). So, when you install a new version of NSTrader you do not need to move the Jurik DLL file.

However, there are template files such as CFB.tpl, JMA.tpl, RSX.tpl, VEL.tpl, etc., which you will need in your 4.0 Template folder. On my system it appears that during installation of NST 4.0 all my existing templates which were in use with NST 3.X were renamed with an extension of v30 and replaced with newer templates.

Mr. Begley's advice on "Update Maintenance 101" is excellent.

Also consider keeping a diary of ALL software installations. Using a Word document or other writing tool, keep a serial list by date of each new software install including upgrades.

In this diary, describe the details of the installation -- where your source files are, whether you need to uninstall or whether the program automatically uninstalls, serial numbers and any unusual selection procedures during the install process. Make note of any quirky things that occur.

Keep this diary in a set of folders with all your other source files and important data files. Back up this set of folders on a regular basis.

Then when you change computers every 2 to 4 years, or you need to reinstall software or you need a serial number quick or you want to install your software on a new laptop, you will have a comprehensive set of instructions for installation and you will feel confident that you have your original systems.

Follow this method for each computer.

Russ

NST4.0
Date :7/14/2003 9:02:59 PM Poster : tew
When is NST 4.0 going to be available for download?

Re: NST4.0
Date :7/15/2003 8:04:21 AM Poster : Ward.net Webmaster
If you (or anyone else) never received our newsletter announcing 4.0 then you should send us an email and make sure we have your current email address on file. We'll send it to you. It contains complete instructions on understanding 4.0 as well as how to put in a free order for downloading instructions.

If you have already put in your order, please be aware that we are very backlogged on this process, because we need to get our new database up to date for each person who will download 4.0. That means searching and comparing to the old database. There are thousands of you wanting to update, and it will take several more weeks before we get to everyone. If you have ordered and paid for a new CD, or if you were a beta tester, you will get some priority, but we can't otherwise shorten the process. Even though we put on some extra staff this summer to help with the conversion, it is still a very time consuming effort because for getting rid of the hardware security device we needed a big new database to allow you to still be able to install on several computers.

SMA
Date :7/16/2003 2:13:19 PM Poster : Greg
Easy question which would really help. If my charts periodicity is say 5 min, and I want a SMA of the last 10 DAILY closes, how would I do that. I can't seem to find a way to separate the periodicity.

Thanks.

Re: SMA
Date :7/16/2003 4:08:26 PM Poster : Maciej
There are probably at least two ways that this can be achieved:

a) There is an add on that allows multiple periods.

b) Use the Intraday Basic category of indicators to pick up the close of each of the 10 days and then average them through use of say the average indicators in the arthimetic category or code the sum of the daily closes and divide by 10. Its a bit crude but should do the job.

If the only thing you need tis your SMA then solution b will suiffice if it gets more complicated then you may have to opt for something like solution a.
If anyone knows of another method I certainly would be interested.

If your weely data is apart from the HLC data then a probably you'll have to go via an API like DataX (not for the faint hearted), otherwise if the weekly data is extracble from the daily data (it doesn't sound as if it is) you could use the add-on with the multiple periodicity feature.

Thanks for the reply. Yes, my data is in spreadsheet form and weekly, and my daily data is CSI. I suppose what I might try to do is to convert the weekly csv file to a daily with the Friday values filled in for the following Monday through Thursday. Would this be difficult in your view?

Thanks again.

If you have a weekly data file (.csv, etc.) and add it's data as other
instrument data to a daily (or intraday) chart, then the Trader should extend
out the weekly data into the daily chart.

Thanks - I had not tried this for some time and did not realize that it was added. On my "wish list" would be that the indicators on this weekly data (when pulled into a daily net" would be calculated on a weekly basis. They would show up as step functions just like the weekly data does. Currently if, say, a moving average is run on the weekly data, the current value is worked into the indicator over the next five trading days. If the parameters for an indicator were in the time frame of the data, the full value of the data on a Friday would be in the indicator immediately on that Friday, and it would carry over through the next Thursday without changing.

I know that this is not a priority thing, but thought I would mention it (g). Thanks for making the weekly data importable into daily charts. You are putting out some great products, especially the Trader.

If the only thing you need tis your SMA then solution b will suiffice if it gets more complicated then you may have to opt for something like solution a.
If anyone knows of another method I certainly would be interested.

On 7/16/2003 2:13:19 PM Greg wrote:
Easy question which would really help. If my charts periodicity is say 5 min, and I want a SMA of the last 10 DAILY closes, how would I do that. I can't seem to find a way to separate the periodicity.

Thanks.

NSDT 4.0 - Copying Alerts and Orders Windows

Date :7/16/2003 4:31:16 PM Poster : Maciej

Hi,
Is it possible to copy the alerts / orders windows into a spreadsheet in NSDT 4.0?
The information is very useful but it would be even more useful if I could copy the data.
Thanks in advance.

NST 4.1 and spread trading

Date :7/17/2003 10:03:09 AM Poster : Marco Calzolari

Is it possible to combine tickers which do not come from Esignal or Dial Data? That is, I am using European Stocks end-of-day data in Metastock format from another supplier, how could I trade a spread with NST 4?

Re: NST 4.1 and spread trading

Hi Marco you might be interseted in this recent press release from deal-4-free. Unfortunately I don't think any of the spread betting companies have a facilitry for downloading real time data into other systems.Its something I have been pressing for. If others have different information I would be very inteested to hear about it.

As part of CMC's commitment to global expansion, we are pleased to announce the launch of our latest branch in New York.

The branch is based in Manhattan and will support our FX product. CMC Forex, the trading name of the US FX operation will continue CMC's commitment to offering the tightest dealing spreads, and the widest range of currency instruments. CMC's re-entry into the American market has been greeted with enthusiasm, with CMC being recognised as the company that introduced online FX trading to the market back in 1996.

CMC is now a registered member of the NFA, which means that CMC is regulated in three jurisdictions around the world. Our presence in America, Australia and the UK means that we have offices in 3 time zones, further helping us to support our 24-hour trading facility.

Re: NST 4.1 and spread trading

Date :7/24/2003 5:59:32 PM Poster : Maciej

You're correct that there is no facility for incorporating directly the prices from CMC, however the way I work round that is to take the quote.com prices during exchange hours and set up NSDT to handle the spreads as commisions for entry exit, ie for the DJIA a $5 entry and another $5 for exit for each 1 $USd bet (GBP if you're dealing in the UK). CMC claim only $5 (buy/sell) is needed but I find that their bid/offer prices can get quite skewed when the markets are really motoring. I find that because of these highish costs its not so suitable for day trading rather for position trading. The CMC trading platform is superb!

If I understand Marco's original question , it is possible to set up a spread symbol using the new features of 4.0.

Re: NST 4.1 and spread trading

Date :8/4/2003 10:00:18 AM Poster : Marco Calzolari

Thank you Maciej and Ben Venue for your replies, but my question was more down-to-earth. Subscribing another supplier or a real time supplier is out of question for me at the moment. I have stock daily data downloaded from a local supplier in Metastock format, I would simply like to try spread trading with NST, that is, long one stock and short another one, or even better, long stock and short index future. It is not a brokers or a commissions matter, it's a matter of finding good trades on a daily time frame. I have already done a fairly good work based on statistics using Excel with the proper stock couples, I guess I could do still much better with NST!
I hope Steve Ward is reading and let us know if he is taking this feature into consideration (for us poor position traders :-))

selecting profitable output variables

Date :7/18/2003 12:05:05 PM Poster : MFK

Lots of discussion at the forum about inputs, parameters, etc. I'd like to get a discussion started on what experience tells me is a far more important topic: output variables.

Here's my experience: I'm pretty good at developing nets with high forecast accuracy—excellent stats for average error, % correct sign, etc. For my own amusement, I've even tracked two nets over time using 95% confidence bands, looking five days out. The forecasts walk those statistical paths with uncanny prowess.

But none of that means the nets are going to be profitable. In this context, I define profitable nets as those that meets three requirements:

1. The net makes money after allowing for commissions, slippage, etc.
2. The money made exceeds that of a simple buy-and-hold strategy.
3. That excess gain fairly compensates me for the time spent developing nets and their accompanying trading strategies.

The first two requirements are a challenge in themselves. But requirement three is often a real enthusiasm killer. Let's say, for example, I've developed a reliable net for forecasting a 10-day percent change in the open. It makes money, satisfying requirements 1 and 2. So far, so good.

Then I go back and calculate what I would have made if I just traded the 10-day percent change without a forecast. The results seem to be random: sometime the net does better, sometimes worse, sometimes there's no advantage either way. When the net does better, it's usually because it got me into a trade before a breakout. But even then, the added profit from being in a trade early may not be particularly significant. Maybe I make a couple of extra percentage points. And that's when I ask myself that poignant line from what I think was an old Peggy Lee ballad: Is that all there is?

So my net fails me on requirement three. Am I the only one wrestling with the problem? I'd like to hear from others on how they go about developing—or selecting—output variables that can give net builders a meaningful trading edge.

Re: selecting profitable output variables

Date :7/18/2003 4:21:29 PM Poster : chris wong

try using neural indicators then you don't have to worry about output variable because there aren't any. the whole worry becomes a non issue.

You are not the only one MFK.

I too seem to be able to develop great looking nets but they don't necessarily stand the test of time and ceratinly it is a time consumming process. Even with all the automation that one has in NSDT, it still can take a lot of time and its not the processing that I'm complaining about - its seemingly minor issues as whether its better to select 1 or n walk forwards, which indicators to reject based on the predictions input %, how far back should one test. I've used neural nets succesfully in other fields but in trading it is a real challenge.
It would be interesting to know how many users use NSDT's neural features for actual trading compared to many of us who I suspect use the product as a straight forward technical analysis package.

Re: selecting profitable output variables

Date :7/20/2003 3:00:24 AM Poster : mstigall

I've used TradeStation and several other high-end technical analysis tools. They don't hold a candle to the optimization tools available in NeuroShell Pro (NSP). IMHO NeuroShell Pro beats them on just the technical analysis + optimization alone. I've programmed several TradeStation optimization studies that could drag on for days! The same studies in NSP take less than 1/4 of the time for equivalent results.

My recommendation is to fine-tune your input selection using the neural network predictions and the weighting factors to find out which inputs are best for the present market conditions. Then use the resulting neural network's prediction as the input to a trading system.

I've had some excellent results using the clustering add-in on several different technical indicators without neural prediction, too. I still use the neural nework weight method to eliminate bad vs good inputs, and then move to clustering.

Bottom line - you have to spend some time doing the homework before your systems pay out. No one gets a great system out of the box without some sweat equity involved. When I was starting out, both Steve Ward and Marge were excellent resources for getting around a problem or issue.

Best of luck on your quest!

Re: selecting profitable output variables

Date :7/21/2003 10:41:50 AM Poster : MFK

Some responses to the problem of selecting a profitable output variable, but so far no real revelations, no "aha" insights, no specific directions to follow. A summary to date:

1. Chris Wong and Maxwell Craven suggest avoiding the issue completely, opting to go on "auto pilot" as it were, using the Neural Indicators add-on to select indicators and parameters for a more or less "black boxed" output.

2. Mstigall sort of goes down a similar side road, using the Clustering add-on to configure indicators that have been sorted and weighted using a neural network (TurboProp 2 I presume).

3. Maciej finds himself in the same bind I do: satisfactory nets, less that satisfactory profits for all the effort. He further suggests that a lot of us aren't even bothering with neural net predictions; instead we're using the power of NST to do better at traditional technical analysis.

My responses:

1. I own and use Neural Indicators. Overall, I've had mixed results: Outstanding trades with good returns, low drawdowns, excellent profit to loss ratios; unfortunately, these trades are usually followed by a series of whipsaw trades that give a lot of the profits back. So Neural Indicators seem to be good for trend following, but a disaster in a trading range. (I can change the results, of course, by tinkering with the indicators and their parameters, but then I've committed one of Steve Ward's cardinal sins of neural net development, turning my out of sample data into in sample, while pretending that it never happened.)

One way I have had some success with Neural Indicators is by incorporating the results of a previously developed TurboProp 2 net. If the net has reasonably good accuracy results, I will use it plus several momentum derivatives of the net as a Trading Strategy input. That often makes a major differences in profit results.

2. I have the Clustering add-on also, but that's not a tool I'm quick to pull out of the tool box. My experiences suggests it would be excellent given a specific trading style and the patience to develop a dozen or so clusters, each one looking for specific entry/exit conditions. In my use, I've gotten some great entry and exit signals; by the same token I've also missed some great trades because I didn't have the clusters in place to recognize other profitable conditions.

What I find more interesting in Mstigall's post is that he still uses neural networks to create or identify the indicators he'll ultimately use in clustering. That's not too unlike my use of nets to develop Neural Indicator inputs. In short, he and I still rely initially on the creation of a profitable--or near profitable--output variable.

3. Is Maciej right? Are great numbers of us using NST as an next generation technical analysis program and ignoring the entire process of developing neural nets? It would be interesting to hear from some of you. I think Maciej is on the mark; my initial post in this topic raises the possibility that this might be the more effective way to use NST.

But I don't want to give up on what I feel is the real potential of neural net forecasting. So any more thoughts on that critical first step: How--what process would you follow or do you follow--to develop robust, reliable and profitable output variable?

Re: selecting profitable output variables

Date :7/21/2003 1:41:37 PM Poster : Steve Ward

I actually developed Neural Indicators exactly because I believed neural nets shouldn't have to be able to predict something to be useful, and that users shouldn't have to figure out what to predict. If you own Neural Indicators, you should use them, especially given your problems with outputs. You seem to be thinking that eliminating outputs is somehow cheating by using a "black box". I don't follow that at all, unless it is another problem analytic people have in addition to the following:

Most of our users are very analytic, or they wouldn't be able to use NeuroShell Trader Professional. I think the big problem all analytic people have, including myself, is unrealistic expectations about their trading systems, and an unconscious obsession to seek perfection. I've told many of you about one of our most successful users - a Fortune 100 company investing hundreds of $millions of their pension funds every day using our net's predictions. Their nets beat ALL the in-house traders. Guess what - their nets only get 70% of their trades right!

Less analytic but highly experienced traders know there are going to be losses and are happy as can be if they have technical systems that get 70% right. My own systems (most built with neural indicators) are even a little better than 70% right, but I still agonize over the losses because I am first and foremost an analytic math/neural net person. I know that as powerful as nets are, it is very, very difficult to find leading indicators, and impossible to find consistent ones, and that no system of any kind works well all the time, or even most of the time. Nevertheless, I have not fully gotten it through my head when it comes to my own money that being profitable in the market is about probability and averages.

But I am getting much better, even getting to the point where I no longer even test out-of-sample - ie, I optimize my Neural Indicators right up to the end of yesterday so I can get all the critical recent moves! Then I reoptimize any day in which the signals are mostly wrong.

The bottom line is every user of a trading system has to guard against being too precise and accurate.

Ah, we're getting somewhere. Steve, I'd like to respond to some of your points, then, if you have the time, get your followup to the ideas raised.

1. "I know that as powerful as nets are, it is very, very difficult to find leading indicators, and impossible to find consistent ones, and that no system of any kind works well all the time, or even most of the time."

I'm not trying to be a smart aleck with this question, but it's one that comes immediately to mind. Given what you say, why isn't the Neural Indicator algorithm the core of NST? Why is the focus on TurboProp 2, which requires an output indicator that's not going to give satisfactory results "most of the time?" As I said, I'm not being smart-alecky. I happen to agree with what you've stated, not because I'm a math/neural net person; I've just used neural nets long enough—Ward Systems products mostly, but others as well—to know predicting chaotic processes such as financial markets is going to be extremely difficult at best.

2. "My own systems (most built with neural indicators) are even a little better than 70% right . . . . "

Without giving away your hard-earned secrets, can you tell us how you develop these Neural Indicator nets. From your other comments, my guess is you don't start by developing a prediction. Instead, you start by developing a Trading Strategy into which you feed Neural Indicators. What inputs do you feed to the Neural Indicators (generally, of course)? Do you in any way constrain the number of inputs (and their parameters) used in an individual Neural Indicator? How many Neural Indicators will you insert into a trading strategy? As a math person, are you at all concerned about the degrees of freedom involved in, for example, a simple Jump 4C indicator, which, if I counted right, could involve the optimizing of up to 20 factors. Do you add standard indicators to the trading strategy as well as Neural Indicators?

I sure would appreciate as much as you'd like to share on this topic. I'm also sure all other readers would feel the same way.

3. "But I am getting much better, even getting to the point where I no longer even test out-of-sample - ie, I optimize my Neural Indicators right up to the end of yesterday so I can get all the critical recent moves! Then I reoptimize any day in which the signals are mostly wrong."

Many years ago a representative of another company—I want to say a neural net company, but technically, they weren't; I believe the company's name was AIM, and its forecasts were the result of some form of mathematical chaining—answered a question I asked about frequency of retraining nets with this comment: "Why would you wait? Why wouldn't you just retrain them every night or every other night, getting the benefit of current changes in the markets?" Until today, I thought he just didn't have the confidence his product could produce reliable results. Your comment—or more precisely, the extensive experience that leads to your comment—most certainly will force me to reevaluate my whole approach.

Thanks for you insights.

1. Chris Wong and Maxwell Craven suggest avoiding the issue completely, opting to go on "auto pilot" as it were, using the Neural Indicators add-on to select indicators and parameters for a more or less "black boxed" output.

2. Mstigall sort of goes down a similar side road, using the Clustering add-on to configure indicators that have been sorted and weighted using a neural network (TurboProp 2 I presume).

3. Maciej finds himself in the same bind I do: satisfactory nets, less that satisfactory profits for all the effort. He further suggests that a lot of us aren't even bothering with neural net predictions; instead we're using the power of NST to do better at traditional technical analysis.

My responses:

1. I own and use Neural Indicators. Overall, I've had mixed results: Outstanding trades with good returns, low drawdowns, excellent profit to loss ratios; unfortunately, these trades are usually followed by a series of whipsaw trades that give a lot of the profits back. So Neural Indicators seem to be good for trend following, but a disaster in a trading range. (I can change the results, of course, by tinkering with the indicators and their parameters, but then I've committed one of Steve Ward's cardinal sins of neural net development, turning my out of sample data into in sample, while pretending that it never happened.)

One way I have had some success with Neural Indicators is by incorporating the results of a previously developed TurboProp 2 net. If the net has reasonably good accuracy results, I will use it plus several momentum derivatives of the net as a Trading Strategy input. That often makes a major differences in profit results.

2. I have the Clustering add-on also, but that's not a tool I'm quick to pull out of the tool box. My experiences suggests it would be excellent given a specific trading style and the patience to develop a dozen or so clusters, each one looking for specific entry/exit conditions. In my use, I've gotten some great entry and exit signals; by the same token I've also missed some great trades because I didn't have the clusters in place to recognize other profitable conditions.

What I find more interesting in Mstigall's post is that he still uses neural networks to create or identify the indicators he'll ultimately use in clustering. That's not too unlike my use of nets to develop Neural Indicator inputs. In short, he and I still rely initially on the creation of a profitable--or near profitable--output variable.

3. Is Maciej right? Are great numbers of us using NST as an next generation technical analysis program and ignoring the entire process of developing neural nets? It would be interesting to hear from some of you. I think Maciej is on the mark; my initial post in this topic raises the possibility that this might be the more effective way to use NST.

But I don't want to give up on what I feel is the real potential of neural net forecasting. So any more thoughts on that critical first step: How--what process would you follow or do you follow--to develop robust, reliable and profitable output variable?

Re: selecting profitable output variables

Date :7/21/2003 5:59:17 PM Poster : Steve Ward

I don't agree that Turboprop 2 isn't going to give satisfactory results most of the time. I've built some very good models with it, and it is technically far superior. But as you point out, there are a lot more choices regarding what output to use, maybe an infinite number. NI lets you concentrate on inputs only. NI also has some disadvantages, the biggest of which is that it is very slow, and gets even slower with more inputs. Not so with Turboprop2. A more advanced NI may someday be in the Prediction Wizard, but for the time being can't we make a little extra money selling addons, like car companies sell chrome wheels and leather seats? The nice thing for us is that we can use other programmers to build addons without putting a burden on the NeuroShell Trader programmers, who have much bigger fish to fry than addons. In fact most of our addons were built because I wanted something new to use in my own trading, and I figured why not sell to others what I built for myself?

I just use one NI in a buy rule and another in a sell rule. Usually the only other rules I use might be time rules (get out at 3pm, for example). I don't use any exit rules because that's too many weights to find. I feed in standard indicators, or turning points. NI constrain their own inputs, because they don't allow many. I use release 4.0 and let training go several hours. NI have such an inefficient training mechanism that it takes that long to train sometimes, and there is less danger of overfitting for the same reason.

But in the end, NI aren't a magic bullet either, because there aren't any. That's why we have a toolkit with lots of options. Our website tells people that if you want a turnkey moneymaker, buy software from someone else. You'll be much happier with realistic expectations.

Ah, we're getting somewhere. Steve, I'd like to respond to some of your points, then, if you have the time, get your followup to the ideas raised.

1. "I know that as powerful as nets are, it is very, very difficult to find leading indicators, and impossible to find consistent ones, and that no system of any kind works well all the time, or even most of the time."

I'm not trying to be a smart aleck with this question, but it's one that comes immediately to mind. Given what you say, why isn't the Neural Indicator algorithm the core of NST? Why is the focus on TurboProp 2, which requires an output indicator that's not going to give satisfactory results "most of the time?" As I said, I'm not being smart-alecky. I happen to agree with what you've stated, not because I'm a math/neural net person; I've just used neural nets long enough—Ward Systems products mostly, but others as well—to know predicting chaotic processes such as financial markets is going to be extremely difficult at best.

2. "My own systems (most built with neural indicators) are even a little better than 70% right . . . . "

Without giving away your hard-earned secrets, can you tell us how you develop these Neural Indicator nets. From your other comments, my guess is you don't start by developing a prediction. Instead, you start by developing a Trading Strategy into which you feed Neural Indicators. What inputs do you feed to the Neural Indicators (generally, of course)? Do you in any way constrain the number of inputs (and their parameters) used in an individual Neural Indicator? How many Neural Indicators will you insert into a trading strategy? As a math person, are you at all concerned about the degrees of freedom involved in, for example, a simple Jump 4C indicator, which, if I counted right, could involve the optimizing of up to 20 factors. Do you add standard indicators to the trading strategy as well as Neural Indicators?

I sure would appreciate as much as you'd like to share on this topic. I'm also sure all other readers would feel the same way.

3. "But I am getting much better, even getting to the point where I no longer even test out-of-sample - ie, I optimize my Neural Indicators right up to the end of yesterday so I can get all the critical recent moves! Then I reoptimize any day in which the signals are mostly wrong."

Many years ago a representative of another company—I want to say a neural net company, but technically, they weren't; I believe the company's name was AIM, and its forecasts were the result of some form of mathematical chaining—answered a question I asked about frequency of retraining nets with this comment: "Why would you wait? Why wouldn't you just retrain them every night or every other night, getting the benefit of current changes in the markets?" Until today, I thought he just didn't have the confidence his product could produce reliable results. Your comment—or more precisely, the extensive experience that leads to your comment—most certainly will force me to reevaluate my whole approach.

Thanks for you insights.

Re: selecting profitable output variables

Date :8/16/2003 12:18:36 PM Poster : mstigall

Just to clarify or "expound" a bit more. I'm very comfortable with several schools of technical analysis, and fond of Bollinger Bands and MACD. I can use those two tools in a plain Excel spreadsheet to trade profitably. My chemical engineering background used statistcial process control charts (very similar to BBAND).

My emphasis now is bioinformatics, and we use clustering quite a bit to find group similar protein families together, etc.

The point is that knowledge of the underlying systems (BB, MACD and clustering; strengths and weaknesses) still helps you create a profitable system. I'm comfortable using the tools because of long exposure to their methods; applying the methods to the stock market works too.

How are you selecting the stocks to run the NN on?

Since I love the BB, I find stocks that provide a good profit with a non-optimized BB system. Consider the stock selection to be the first step in a filter process, where you try to end up with reliable inputs and outputs.

Re: selecting profitable output variables

Date :8/16/2003 12:35:04 PM Poster : mstigall

Reading your third point - we differ there quite a bit. I'm a middle-aged over-analytical professional computer nerd .

When I started this little path to knowlege over twelve years ago, I mapped out the terrain. Start with stocks, moving into stock options; finally commodities and futures. The path was based on the amount of experience and knowledge I thought each additional market would require. It took me quite a while to get to the point that I felt extremely confident with the stock market and began to tackle the option learning curve.

Each year, I start out with $5K of "mad money" for my training. At the end of the year, I put profits into long term "buy and hold" investments and start the next year with $5K seed money. I set a goal for average returns per month (after broker fees) and strive for it during the year.

Some day I may be able to just do this for a living, but in the meantime I view the process as "training for my retirement". If I make mistakes now, I can recover easily because I have a full-time job. In fact, if I lost the whole 5K, it wouldn't affect my daily lifestyle at all (just my ego).

So you talk about how criteria #3 is never satisfied. Your time is never reimbursed. What if you found out that it took ten years of homework and training (your time) to end up with a reliable and profitable system that lasted the next fifty years of your life? And for the fifty years the market won't remain static - your methods will need to adapt and change in different market conditions.

Take a longer term view. Most forms of career training (college, etc) take years to complete. Why should home-based trading be any different?

Trading Systems for the COMP and DJIAA.

Date :7/21/2003 12:45:00 PM Poster : Bob

Hello Everyone

I retired last year and am working to keep my retirement afloat.

My retirement is closely linked to the COMP and DJIAA.

I am trying to develop a Trading System for the Comp and Djiaa with my NeuroShell Professional.

I have not been very successful up to the present time. Do you have any suggestions or can lend some help?

Thanks
Bob Swihart

Since you own Neural Indicators and Turning points with Trader Pro, I would build a trading strategy with Recur4. I would feed it the following indicators:

1. Peak probability (% change) - Valley probability (% change)
2. Peak probability (bars) - Valley probability (bars)
3. Close-open
4. Close-lag(1,close)

If that doesn't work well, try adding two more similar indicators and use Recur6. Give the Neural Indicators a good long time to optimize using release 4.0, maybe 3 hours or so.

Steve,

I wonder how you'd agvise handling the situation when running the back testing up to the close of the previous session, ie for 31st, back testing goes all the way to 30th and the back test gives you a trade say just before the close of 30th. Do you advise taking that trade on market open or just ignoring it and waiting for the next signal. I assume that by setting the "end paper trading by date" to 30th one can avoid that, but is that the best way of handling such a situation with a neural system? For something such as trading the DJIA that could be acceptable as one would expect a signal fairly often but for other symbols one could be waiting on a signal for some time.

Re: Trading Systems for the COMP and DJIAA.

Date :8/1/2003 9:40:21 AM Poster : Steve Ward

The closeout trade is new with release 4.0 since that is the first release where we actually show the trading signals during the training period. It is not a real exit signal, we just close out the trade so that trading can start fresh with the new data coming in after training. So really, you could do either of the two things you mentioned. I would tend towards waiting for the next signal, however, because if you started trading on an old one, you might miss a big move before you get in.

mangled CHT file ?

Date :7/22/2003 11:50:14 AM Poster : Chachi

Still running version 3.8 for the purposes of this query (v4.1 not yet rolled out here)

Is there any further detail behind possible causes of a "-2147417848 (80010108) Runtime error in GraphWin zzz_Graph_UpdateData" , or is there anything to recover/etc a 'dead/unloadable' CHT file?

Background:

Am in the midst of creating some new charts based upon a custom DLL I wrote in PowerBasic 7.02 last month. Out of about sixteen new charts so far, three now refuse to load (which loaded just fine last week) at all, causing the above error.

The charts appear to complete their calculations/etc and are in the midst of updating the graph when the offending msgbox/errorbox pops up.

Re: mangled CHT file ?

Date :7/22/2003 1:55:45 PM Poster : Ward.net Webmaster

If the cht files have become corrupted in some way (which seems likely since they loaded just last week, assuming you didn't change them in any way) they may never load again. One thing that could have happened is that some operating system function has regressed to an older version due to you installing some program in the last week that overwrote a newer function with their own older one (some installs do that). So you might see if they load on other computers. If that fails, send one of them to support@wardsystems.com and we'll see if we can load it here and try to determine if anything else could be at play besides corruption.

Are any values/seeds/indicator outputs/etc saved within the CHT file itself?

Could some sort of DLL glitch we somehow did not catch in weeks and weeks of testing last month suddenly raise its head? I can't think how honestly but curious.

So you might see if they load on other computers. If that fails, send one of them to support@wardsystems.com and we'll see if we can load it here and try to determine if anything else could be at play besides corruption.

On 7/22/2003 11:50:14 AM Chachi wrote:
Still running version 3.8 for the purposes of this query (v4.1 not yet rolled out here)

Is there any further detail behind possible causes of a "-2147417848 (80010108) Runtime error in GraphWin zzz_Graph_UpdateData" , or is there anything to recover/etc a 'dead/unloadable' CHT file?

Background:

Am in the midst of creating some new charts based upon a custom DLL I wrote in PowerBasic 7.02 last month. Out of about sixteen new charts so far, three now refuse to load (which loaded just fine last week) at all, causing the above error.

The charts appear to complete their calculations/etc and are in the midst of updating the graph when the offending msgbox/errorbox pops up.

Re: mangled CHT file ?

Date :7/22/2003 3:30:54 PM Poster : Chachi

Same behavior at home running WinXP and new NSDTP v4.1 .... but it now appears to be a DLL glitch which doesnt make much sense. :(

I renamed the DLL to a .!!! extension and loaded the chart, got the 'unable to locate, contact provider' errorbox but it then loaded up and displayed. Then saved it down under a newname and it shrunk from 527k to 493k. Renamed the DLL back to a .DLL extension and loaded the new one up and same error msgbox popped up.

I have rebuilt the chart/strategy from scratch, saved it, closed, reopened, played around, resaved, no problems. Somehow the chart/dll will shoot itself in the head after some indeterminate period of time between the next few days and two weeks and get to a state of being unable to load.

Is there still a mem leakage issue with PowerBasic 7 ?

On 7/22/2003 3:08:59 PM Chachi wrote:
Are any values/seeds/indicator outputs/etc saved within the CHT file itself?

Could some sort of DLL glitch we somehow did not catch in weeks and weeks of testing last month suddenly raise its head? I can't think how honestly but curious.

On 7/22/2003 1:55:45 PM Ward.net Webmaster wrote:
If the cht files have become corrupted in some way (which seems likely since they loaded just last week, assuming you didn't change them in any way) they may never load again. One thing that could have happened is that some operating system function has regressed to an older version due to you installing some program in the last week that overwrote a newer function with their own older one (some installs do that). So you might see if they load on other computers. We don't know if PowerBasic has new memory leaking problems or not. However, that shouldn't make your chart unloadable, because the memory would leak during prolonged use. Now that you've pinned the problem down to your DLL it seems to us much more likely that you just might have a loop or other bug in your DLL code that shows up under some data circumstances. Of course it could be a PowerBasic bug too.

Solved for the time being .... had to add an ERASE of a string array, which to my understanding of PB's methods _should_ be unneeded.

Recur 4 inputs.

Date :7/22/2003 2:32:34 PM Poster : Jerry Clark

To Steve Ward,

This is a question about your reply to Bob on July 21 in relation to the Recur 4 indicator inputs.
I have the NI and TP addons and was wondering if you could tell me how to build the following.
!. Peak probability (% change)-Valley probability (% change)
That's the # 1 input to the Recur 4 that you suggested. If you could explain how that is built, the remainder of the inputs should follow.
Thanks, Jerry

Re: Recur 4 inputs.

Date :7/22/2003 3:12:54 PM Poster : Steve Ward

Use the Indicator Wizard and insert the indicator Subtract from the Arithmetic category. Set Operand1 to Peakprob and set Operand2 to ValleyProb, both of which you will find in the Turning Points Category.

Jerry,

For the DJIA I force an exit to ensure that I'm out of all trades by market close and on some models I will allow only one trade per day (an indicator is available called onetrade on this web site).
Once you get your model working you may want to control the period of the day in which you wish to trade, the index is known for having a big surge at open and a dull period around lunch time. Some of us like to avoid those difficult periods.

Re: Recur 4 inputs.

Date :8/8/2003 12:16:14 PM Poster : Bertrand

I guess you simply build a cumulative probability indicator by using the Subtract in the indicator wizard.

Best Long signals should come when peak prob. is high in relation to valley prob. This is what Steve is trying to achieve in my opinion.

All the best,
Bertrand

Sorry,
but what I have written is not true.

It was meant to be like this:
Best Long signals should occur when valley prob is high in relation peak prob. The reverse is the case for shorts. By substracting you combine both measurements into one input for the net.

Hope it is clearer now...

Bertrand

4.1 patch won't install

Date :7/22/2003 10:46:16 PM Poster : Steve K

Over the past 4 days I have tried several times to install the 4.1 patch from the website and always get the same error.

The installer can't find the installation package "NeuroShell Trader 4 Web.msi". I've done a search of my hard drive and this file doesn't exist, so I assume it can't locate the file on the installation web site.

I sent a jpg of the error message to support but haven't received a response yet.

thx, Steve

Re: 4.1 patch won't install

Date :7/23/2003 9:37:48 AM Poster : Ward.net Webmaster

There have been about 3 or 4 users with this problem. As yet we don't know why, because the file is there and others can install the patch. We suspect some sort of registry problem. Since this problem involves the commercial install package we use, it could take us a few days to find out what is wrong. In the mean time, if you have this problem, you'll have to download the full 4.1 release. Dig up the email you received for downloading 4.0. Follow the directions again and you'll find 4.1 there.

TURNING POINTS ADD ON

Date :7/26/2003 11:05:20 AM Poster : Steve S

I am interested in purchasing the Turning points add on for the NST and was looking for some opinions.

Re: TURNING POINTS ADD ON

Date :8/3/2003 9:02:33 AM Poster : Xprogrammer

I use the TP a lot and find it quite good. I'll caution that you have to either experiment or use the optimizer to find the appropriate cycles in your particular stocks. The TP isn't made for just one cycle period and it can find many. I use it two ways. The first is optimized in a trading system. The second is an indicator to confirm trading situations I have already built. In the second mode I simply watch the probability it is giving. If my regular system gives off a trading signal I verify that the TP probability of a turning point is high for confirmation.

Re: TURNING POINTS ADD ON

Date :12/12/2003 7:11:11 PM Poster : Maciej

I've found it useful but not a magic bullet. For me the tricky part is how best to define the shape of the peaks which is a parameter and ideally it should be an adaptive type of parameter as the actual shapes that these turning points make does vary.

NST 4.0 and Internet Connerction

Date :7/29/2003 10:35:01 AM Poster : Greg Kramer

Re: "One of the first things to know about the new release is that it uses software protection rather than the hardware security device. You can install NeuroShell Trader on multiple computers, but you "authorize" it to work on one computer at a time via the Internet." [from "Announcing NeuroShell Trader - Your Way!" page].

Does this mean that anytime (after the initial installation and authorization) if want you run NST 4.0 then you MUST be connected to the internet? Or is this a one-time requirement. I use NST on a single computer (a laptop) and many times develop strategies "off-line" in locations where I have no internet connection.

Re: NST 4.0 and Internet Connerction

Date :7/29/2003 7:30:09 PM Poster : Ward.net Webmaster

No, you do not have to be connected to the Internet to run. However, if you want to move operations to another computer, you have to make that switch via the Internet. You use the Internet connection to deactivate on the one computer, and then use the Internet connection to reactivate on another. But after activation no Internet connection is required until you want to move again. So for example, if you want to go on vacation with your laptop, deactivate your desktop copy, and activate the laptop, both actions requiring the Internet connection. Then use the laptop on the plane, on the beach, wherever you want without worring about connecting again until you come home.

May need a rethink for non-US customers with unforgiving corporate LANs.

I had to ring in and manually activate v4 at work as our corporate LAN blocks whatever method you are using to connect & activate/validate the product.

When I asked what method (eg HTTP, TCP, etc) of connection was being used, to perhaps investigate with my firewall people, the response was 'no idea' ...

Since no one is available at your helpdesk to assist with manual reactivation until after 2pm London time, this means I cannot use my copy at home, deactivate it when I leave, and then come into the office and use v4 until most of the day is over.

I have the same problem, I have to disconnect my LAN cable and connect to Internet with a phone line if I want to authorize/deactivate NST from my office (everytime it requires rebooting the PC twice).
I am not a LAN expert, but why not trying to program the next NST release to use the standard port 80, like the Prophet data feed. I have checked that my LAN proxy server actually uses this port.

fixed fractional position size

Date :7/30/2003 11:53:10 AM Poster : Steve Fowler

having just updated to 4.1 and not having used the program for a while I am having some difficulty with my trading strategy. First, is it possible to use multiple position exit signals where one of the signals is a market order, the other is a stop (but not a trailing stop). Also, is it possible to have the position size traded be derived from a formula rather than a fixed number of shares, of a fixed dollar amount? For example, can I risk 5% of total capital on a trade and then knowing that dollar amount enter that into a calculation to arrive at the number of shares to trade?

Re: fixed fractional position size

Date :7/30/2003 12:49:39 PM Poster : Ward.net Webmaster

See the tip on this site called "Adding to a position".

having just updated to 4.1 and not having used the program for a while I am having some difficulty with my trading strategy. First, is it possible to use multiple position exit signals where one of the signals is a market order, the other is a stop (but not a trailing stop). Also, is it possible to have the position size traded be derived from a formula rather than a fixed number of shares, of a fixed dollar amount? For example, can I risk 5% of total capital on a trade and then knowing that dollar amount enter that into a calculation to arrive at the number of shares to trade?

Tradestation Program for Exporting Data

Date :8/5/2003 10:13:13 PM Poster : Steve in California

For those using Tradestation as a data feed:

It's useful sometimes in training nets to be able to quickly create flat file versions of data sets rather than use the TS interface.

What follows below is code that will export data from Tradestation in a way that can be used by NST without modification.

```
{**************************************************************************
Tradestation data export script for NST - Steve in California, 8/2003
**************************************************************************}
Inputs:
DirectoryName("c:\temp\"), NumberOfDataStreams(9);

Variables: Year2000Year(2001), i(0), FileName("");

If BarNumber = 1 Then Begin
For i = 1 To NumberOfDataStreams Begin
FileDelete(DirectoryName+GetSymbolName of Data(i)+".csv");
FileAppend(DirectoryName+GetSymbolName of Data(i)+".csv",GetSymbolName of Data(i)+ NewLine);
FileAppend(DirectoryName+GetSymbolName of Data(i)+".csv",GetSymbolName of Data(i)+" 1 Minute"+ NewLine);
FileAppend(DirectoryName+GetSymbolName of Data(i)+".csv","Date,Time,Open,High,Low,Close,Volume"+ NewLine);
end;
End;

If BarNumber >= 1 Then Begin
For i = 1 To NumberOfDataStreams Begin

If NumToStr(Year(Date),0) = "103" Then Year2000Year = 2003
Else If NumToStr(Year(Date),0) = "102" Then Year2000Year = 2002
Else If NumToStr(Year(Date),0) = "101" Then Year2000Year = 2001
Else If NumToStr(Year(Date),0) = "100" Then Year2000Year = 2000
Else Year2000Year = 1900 + Year(Date);

FileAppend(DirectoryName+GetSymbolName of data(i)+".csv",
NumToStr(Month(Date),0)+"/"+
NumToStr(DayOfMonth(Date),0)+"/"+
NumToStr(Year2000Year,0)+","+
LeftStr(RightStr("000"+NumToStr(Time,0),4),2)+":"+
RightStr("000"+NumToStr(Time,0),2)+","+
NumToStr(Open of data(i),2)+","+
NumToStr(High of data(i),2)+","+
NumToStr(Low of data(i),2)+","+
NumToStr(Close of data(i),2)+","+
NumToStr(Volume of data(i),0)+ NewLine);
End;

Automatic search for BestNet

Date :8/8/2003 12:21:35 PM Poster : Bertrand

Ward Systems,

what I really miss is a search for best net / system for two data sets. I would like to run the training on one set & have the Trader evaluate that on true out of sample data, the second set. The user will then set the weighting function (data set 1 weight 0.3 / data set two (out of sample) weight 0.7) & the Trader comes up with the Net that performes best on both sets.

I would be nice if you could include this option in future releases as an alternative to walk forward testing. I guess it would shorten trial & error processes to reach a stable model.

Best regards
Bertrand

ForeTrade.com GPF for the Trader

Date :8/8/2003 12:24:13 PM Poster : Bertrand

Hi,

I do not seem to get a response from ForeTrade.

Is anyone using their generic pattern finder for the Trader & would like to share some opinions on the product? Some daytrading with only one GPF input had good results on their site.

If someone would like to sell his license for GPF Pro please contact me.

Regards & good trading,
Bertrand

Re: ForeTrade.com GPF for the Trader

Date :8/9/2003 5:59:53 AM Poster : bruno

Hi,

The example on the ForeTrade web site is probably a little over-optimistic as a pattern seems to have performed very well during that training period, but imho, the GPF is still worth a try. It is generally recommended to rather use the GPF to detect a panel of short and long patterns with the objective of improving an existing trading model.

Version 1.6 is currently being beta tested, and should be released shortly.

Regards,
Bruno

User forcing Trader to use max. system power?

Date :8/11/2003 12:49:08 PM Poster : Bertrand

Ward Systems:

I am testing out a new machine in combination with the NeuroShell Trader.

Somehow the Trader uses only 25% of the max. power of the system.

Is that unusual? Can I force the Trader to use max. power during learning when no other trading application is run (through the night for example)?

All the best&
good trading,

Bertrand

Re: User forcing Trader to use max. system power?

Date :8/11/2003 1:06:59 PM Poster : Ward.net Webmaster

We don't understand that either unless your new machine has 4 processors in it. If you optimize then you should use almost the entire processor you are on. For overnight running read the tip on this site called "Speeding up overnight optimization".

Actually, if you have a dual-processor machine and hyper-threading is enabled, the Task Manager will indeed show four processors and your cpu consumption will only be 25%. As Steve was alluding to, you can use 100% of your cpu by running four instances of NeuroShell. Even as I type this message, I am optimizing four nets simultaneously and the Task Manager cpu meter is pegged.

Multiple processor support is definitely on our list. In the mean time everyone should note what John Gotwals said. You can run multiple copies of NeuroShell just by making more copies of the .exe with different names.

My Top Release 4.1 Feature Request

Date :8/13/2003 10:24:41 AM Poster : Steve in California

I understand that it'll be necessary for 4.0 to be digested for awhile. Nevertheless, I see 4.1 new feature requests seeping into the discussion.

So, I thought I'd see if I can't get my top new feature choice toward the top of the queue by gettin' it in early...

I think it's clear that choice of Objection Function DOES make a difference in the result of training. I understand that there are some folks with opinions that matter who believe otherwise. 8-) Nevertheless, I've got lots of examples that demonstrate that this is the case.

===>>> It would be terrific to be able to write our own Objective Functions. I've written about this before and included additional details on current Objection Functions and what they're looking at.

Thank you for automatic backup feature

Date :8/15/2003 3:55:59 PM Poster : Dave Hubbard

I just wanted to say thanks for the new automatic chart backup feature in 4.1. When the power outage hit, I thought I had lost a net that had taken 2 hours to optimize. Because of the automatic backup feature, 2 hours of work was saved!

intraday PriceTarget% trigger

Date :8/18/2003 7:01:34 AM Poster : chachi

Am revisiting a model which has performed reasonably well but which needs some tailoring in its exit/take profit strategy.

Have noticed times where the PriceTarget% level is violated intraday but not on the close, hence the system plods onward (invariably never returning to the level on a closing basis) rather than exiting at or near the high/low of the day.

I cannot for the life of me figure out how to get NSDTP to accept the effective PriceTarget% level to be considered/used as the exit price except on a " PriceTarget% vs Closing Price" basis, never "PriceTarget% vas High Price" basis.

How does one implement an intraday 'take level' in addition to end-of-day reversal or exit logic on a daily chart?

Re: intraday PriceTarget% trigger

Date :8/18/2003 5:29:14 PM Poster : Ward.net Webmaster

We are a little confused here - we aren't sure we understand why you aren't using intraday charts with your DayTrader to accomplish your "take level". Since you probably could accomplish your pricetarget with a 1 minute chart, is it perhaps because you are building daily indicators that you can't accomplish on an intraday chart?

Perhaps you mail Emmetropia with your question, they provide a multiple time frame addon for the NeuroShell Trader - this should provide plenty of room for customization of time frames in entry/exit strategies.

Which workstation do you use to model such a long data stream? I don't know how "big" your model is, but optimization time could possibly swell...

All the best,
Bertrand

Re: intraday PriceTarget% trigger

Date :8/21/2003 9:40:18 AM Poster : chachi

This particular model does not utilise a net or adaptive indicators so optimisation is not an issue, but FWIW our 'Ward' PCs are dual p4 2.6 boxes with 2gb of ram ...

On a daily chart, just as one can have a stop level which is aware of high/low levels and will trigger off them, one should be able to have a 'take profit level' which can also trigger off the high or low and reference either as the traded/exiting price.

I may drop a note to Emmetropia, but I cannot see how their addon can help in since it is the hardcoded logic within NSDTP that is my problem not the timeframe.

Our programmers have written the following tip (soon to appear on this site) in order to explain why the Trader does what it does and how you can accomplish what you want:

Creating Price Target exits

A price target is an exit which gets you out of a position with a prespecified profit. A price target exit can be created in the NeuroShell Trader in one of two ways:

1) Use one of the built-in Price Target indicators as your exit condition in conjunction with a market order. This method will get you out at the open of the next bar once the CLOSING price reaches your price target.

2) Use an exit condition that is always true [for example A=B(Volume,Volume)] in conjunction with a limit order at a price of Add2(EntryPrice(Trading Strategy,0), X) where X is your price target. This method will get you out if future price movement (LOW or HIGH) reaches your price target. Note that for a short exit, the price target should be below the entry price and therefore you should use the Subtract indicator instead of the Add2 indicator.

The difference between #1 and #2 is that #1 reacts to past information using a market order, whereas #2 places a limit order to exit on future price movement before the price movement occurs.

Why you might ask, don't the Price Target indicators take into consideration the high and low prices? The Trader does not evaluate indicators while a price bar is happening (i.e. tick by tick). It only evaluates indicators when a price bar is complete and all the price bar's data has been collected (Open, High, Low, Close and Volume). Because of this, the Price Target indicator only evaluates at the end of each price bar and bases its logic on the Closing price. It does not base its logic on High or Low because these prices are past history and realistically you can only now get out at the closing price (actually the open of the next bar, but that information is not yet available when the price target indicators evaluate). Therefore to actually be able to get our near your price target at the end of a full bar, the closing price is looked at instead of the high or low price.

On 8/21/2003 9:40:18 AM chachi wrote:

Advanced Indicator Packages

Date :8/19/2003 9:13:19 AM Poster : Dave Hubbard

I was looking at some of the advanced indicator packages including the turning points add on. I am very interested in any experiences with the indicators in the chaos and fractal category and the flag category. I am also interested in any feedback in regards to confirming net signals with a trend following indicator in the trading system.

Dave

Are nets only good at entries?

Date :8/19/2003 2:22:39 PM Poster : Dave Hubbard

This is mostly a philosophical question. It seems that the nets I have been able to develop so far are very good at picking points to enter the market but are terrible at exiting the market when they are wrong. I am wondering if this is a similar experience for others. I am also wondering what others have done to alleviate this. I know there are those from the purist camp which say to just trade the net signals on several different stocks. This will reduce your risk by way of diversification. This is a very good idea. There is also another way to approach this problem and that is to look at it like a system trader and apply a trade management strategy around the net entry signal. I would just like to hear some opinions, ideas, or experiences in regards to this.

Re: Are nets only good at entries?

Date :9/7/2003 2:31:17 AM Poster : Alan RHodes

I am very surpised to read your post. I am still waiting for the delivery of the software, but one of the things that attracted me to NeuroShell is that it had built-in exit rules that could be used in the models.

I have played around with a very crude genetic algorithm. What I am seeing is that it merely needs supplemental exits due to getting burnt on huge one day moves. This program maybe has 0.1% of the capability of NeuroShell.

Post me if you still feel this way about the software, and maybe that is one of the things I can work on after about a month when I know maybe 5% of what this software can do.

Re: Are nets only good at entries?

Date :9/8/2003 3:25:00 PM Poster : Maciej

I sometimes use neural networks for the exits as well as the entries but there seem to be two issues with doing that:

a) the back testing gets a lot longer.

b) the "exit network" is generally a near copy of the entry network where one relies on a negative value to exit. I haven't figured out how to encapsulate the exit indicators (ie trailing stops etc) into a network.

If anyone has I'd be keen to know how its done.

Re: Are nets only good at entries?

Date :9/9/2003 12:42:49 PM Poster : Maciej

The tip is sound advice but that is not what I'm trying to get to. My point is that it would be useful to know if anyone has used neural nets with indicators inside the nets such as "Open position profit/loss" as well as other indicators such as momentum to get the neural network to make a judgement if conditions favour hanging in a trade or getting out. I can enter with a net but can I get the net to ascertain the most opportune moment to get out based on my current situation? To give an example should I get out on close of day or are conditions favourable to hold overnight because my current loss/gain does not warrant getting out. If I use only normal indicators and no trading system/position information then any net used for exits is in effect working like an entry net and that's not what is really needed.

Number of periods ago an event occurred?

Date :8/22/2003 12:52:07 PM Poster : Rick D

I hope this is an easy one. Let us assume I am interested in knowing how many periods ago a certain event occurred. For instance, I would like to know how many periods ago that the price was less then 0.9 x Current Price.

I've considered using Selective Lag to determine this, but it seems to me that to go this way means I would need a time series which numbers each period consecutively, which is not a time series that I have, or even know how to create in NST (although easy to create in excell). Anyway, can anyone help me out?

Thanks,
Rick

Re: Number of periods ago an event occurred?

Date :8/24/2003 10:44:20 PM Poster : Steve in California

Advanced Indicator Set 2 contains an indicator called "Bars Since Condition" where Condition is a Boolean Expression.

Re: Number of periods ago an event occurred?

Date :8/26/2003 10:46:12 AM Poster : Xprogrammer

I think there might be a problem getting the condition to refer to the current close. As I understand how NST works, "close" will always refer to the price of the bar being looked at, not the most recent one. Maybe somebody can correct me if I am wrong about that.

On 8/24/2003 10:44:20 PM Steve in California wrote:
Advanced Indicator Set 2 contains an indicator called "Bars Since Condition" where Condition is a Boolean Expression.

On 8/22/2003 12:52:07 PM Rick D wrote:
I hope this is an easy one. Let us assume I am interested in knowing how many periods ago a certain event occurred. For instance, I would like to know how many periods ago that the price was less then 0.9 x Current Price.

I've considered using Selective Lag to determine this, but it seems to me that to go this way means I would need a time series which numbers each period consecutively, which is not a time series that I have, or even know how to create in NST (although easy to create in excell). Anyway, can anyone help me out?

Thanks,
Rick

position sizing

Date :8/25/2003 3:12:03 PM Poster : Sylvain Gauthier

I am doing a kind of market survey here. If there is a serious interest in a money management and position sizing add-on, it can develop pretty soon. It is essential that I get replies to this message.

NST is extremely powerful and actually I am making money with it in real time using very simple techniques but the returns could be boosted with position sizing and Monte Carlo simulation.

The Multiple Time Frame add-on is also very powerful and useful.

Re: position sizing

Date :8/25/2003 9:18:47 PM Poster : fhealy

I agree that a position sizing and money management add on would be a great addition to NST. I would like to suggest that the add on take into effect the fact that we may be trading multiple stocks with one trading stradegy, so that based on available capital we may not be able to take all trades NST projects due to the fact that we are in the market with a prior trade on a different stock the stradegy is following. Designing the add on so that it takes into effect a trading strategy with multiple stocks instead of one stock would complicate the task, but I think it would be a great addition to the program. Also, providing various analytics on a portfolio basis, depending on how extensive you wanted to make it, would be very nice.

Re: position sizing

Date :8/26/2003 3:36:16 AM Poster : Bertrand

Hi Sylvain,

yes, sure there is. Go ahead...

I am also amazed at the power of NST. Especially when the cluster indicators & Adaptive Turboprop 2 are concerned...

Sure the returns could be boosted with incorporated money management, but the main point seems to better risk/reward ratio. If anyone wants to dive further into this topic I can only recommend Ryan Jones book about this, the title may be a bit misleading, but it covers the basics indepth.

I guess it would be great if NST could take care of MM rules even during optimization of strategies...

Good trading,
Bertrand

Sylvain,
I also would find an MM add-on to be quite useful.
For instance, Dr. Van Tharp considers MM to be the
most important part of system design, followed in
importance by exits. Jim

Yes I would be very interested in monte carlo for this application not only for postion sizing but also for testing the robustness of the systems, etc...

I would be very interested in seeing at least these features brought over to NeuroShell.

I would be interested in discussing this with you further and I would definately be interesting in purchasing a product like this.

I too would be very interested in a money management and position sizing add on and would be a purchaser of the product. To the extent that the add on could also take into consideration the situation where a trading strategy may be applied to more than one stock at the same time would enhance the add on's value.

Custom Indicator Help Files
Date :8/29/2003 4:15:30 PM Poster : usgvince

How do you create a help file for a custom indicator? Of course I check the box and I can browse in the right directory, but what file do I write my text in. I've tried "Notepad" to write a help file. I also don't understand the, "file indicator" below the check box to create a help file. I hope I'm calling it by the right name.

How do you delete a custom indicator?

Thanks

Re: Custom Indicator Help Files
Date :8/31/2003 10:19:02 PM Poster : Rick D

Don't know about creating help files for Custom Indicators, but I am very interested in knowing the answers to your questions as well. Regarding deleting a Custom Indicator, go to "Insert", "New Indicator". Highlight the custom indicator you wish to delete, and then press the "Del" key on the keyboard. I would have thought that they would have designed things so that you would highlight the indicator, and then right click for a menu that included "delete" as one of the choices, but apparently this is not the case.

Regards, Rick

Help files in neuralshell are real windows help files. There are a number of softwre programs out there which will make them (probably even freeware), but you can't make them with the notepad, at least I don't think so. I don't know if Word will make them though. I do know you can make them with Microsoft Visual Studio.

Re: Custom Indicator Help Files
Date :9/2/2003 10:53:31 AM Poster : Ward.net Webmaster

There is indeed something called a Help Compiler in Visual Studio, and we use it. Most compilers of any kind should have one. We also use software called RoboHelp, but it is pretty expensive for casual help file building. We don't think Microsoft Word builds help files, but we agree with Xprogrammer that there are many less expensive alternatives to build Windows help files. Do an Internet search and see if you can find some shareware, and please post back here if you find something good.

Intraday Data for NS Day Trader
Date :9/7/2003 11:13:55 AM Poster : Mal G

I need help in choosing an intraday data feed for NS Day Trader Pro. Can anyone help please? Qcharts and eSignal appear to cost roughly the same. Does it matter which one I choose?

Re: Intraday Data for NS Day Trader
Date :9/7/2003 1:22:42 PM Poster : Maxwell Craven

There is also Prophet.net which now works with NSDTP and costs much less than either of those two.

On 9/7/2003 11:13:55 AM Mal G wrote:

Re: Intraday Data for NS Day Trader
Date :9/8/2003 1:28:57 PM Poster : Ward.net Webmaster

Here in our view are the unique features of each as of this writing -

Prophet.net - great low prices less than half the cost of the others ($29.95 - $39.95 + fees). You should have at least release 4.2 to use Prophet.

eSignal - has many world exchanges and continuous intraday futures we don't think the others have. Unless you trade US and Canadian exchanges this would be your choice.

Quote.com - has much more than the 60 trading days (about 3 months) of historical data the others are limited to in case you feel that much data is necessary (we just loaded over 5 years of 5 minute bars of AOL and it showed no sign of stopping there)

Both prophet and eSignal have special prices for our customers if you go through our link:

http://www.neuroshell.com/links.asp

Re: Intraday Data for NS Day Trader
Date :9/9/2003 12:52:24 AM Poster : Alan Rhodes

I plan on trying Prophet, but I switched from Quote.com to Esignal becasue Esignal is so much more reliable. I started off with Esignal, switched to Quote.com for the extra data, then switched back when my MEtaStock software stopped working near when I was planning on entering the market on a major trade. Equis blamed Quote.com, which I believe. I just hope I can rite the indicators I wrote into MetaStock into Prophets graphing software.

But the lack of real time data really bugs me.

I am using Q chart for my data feed and I am very pleased with them . Esignal is more expensive >

Re: Intraday Data for NS Day Trader

Date :11/18/2003 6:40:26 PM Poster : Maciej

Depends whether its stocks or futures - you'll find suggestions already on this site. I believe that the bottom line on cost between Esignal and Quote.com is that Esignal will tend to work out more expensive - although for futures its a superior service to that offered by Quote.com with the proviso that currently there is only 60 days worth of intra day data available per symbol for Esignal but it has continous futures which quote.com does not. As to workability with NSDT - I myself have found both to be equally good.

Internal format of dates passed to DLLs?

Date :9/8/2003 9:02:04 PM Poster : denizen2

I can't find any info on the internal data format for dates that are passed to a DLL.

I believe that a Single float is the date type. Is that true? How is the date represented? Is it a 'Julian' date, and if so exactly what date is defined as the 'zero' date? How is the fractional part of the number interpreted? for Time? If so, how exactly represented.

Thanks,
Craig

Re: Internal format of dates passed to DLLs?

Date :9/9/2003 6:37:08 AM Poster : Xprogrammer

Dates are double float where the whole part is the date and the fractional part is the time.

Re: Internal format of dates passed to DLLs?

Date :9/9/2003 12:49:35 PM Poster : Xprogrammer

Oh, and the Julian date is where 1 is January 1, 1900 (that according to Ward's SDK). The time is just fraction of a day so 1/24 = 1 hour, 1/1440 = 1 minute, etc. (the SDK just says the time is the fraction, but it was easy to figure out for a salty old programmer that the fraction was just the fractional part of the day).

I am using Cyber Trader Pro 4.0, and am pleased with the trading platform and customer support. However, note that for trading listed securities in lots of 1,000 shares on the NYSE, the commission (including SEC fees) works out to about $16.50 per trade (buy or sell). In addition, if you do not have at least 50 trades per month, you will be billed a data communications fee of $250.

Principal componants analysis

Date :9/11/2003 8:34:48 PM Poster : Sam Wheat

Steve or anyone who has mastered the art, please post an example and brief commentary on how to use the PCA indicators.

Thanks,

Sam

Re: Principal componants analysis

Date :9/12/2003 9:48:35 AM Poster : Bertrand Wibbing

Hi Sam,

one use that would come to mind is to use PCA inside the Trader to build better inputs with higher significance (better content so to speak). In my opinion it can be used as a great tool to decorrelate any type of indicator data. When applying PCA it will give you a sort of ranking the most important features of the data. The first vector has the highest variance to speak more technically. You could then decide to remove the vectors with lower variance to reduce the final number of inputs to your neural net & thus make it more predictable & finally more stable when useen data comes along... :-))

Sorry to make this short, but I am far behind work... :-)

Bertrand

Walk Forward testing with retraining

Date :9/13/2003 1:53:45 AM Poster : Alan Rhodes

I am curious as to whether you can actually test the results of retraining the nets on ones predictions. With walk forward testing, it seems to me it would be easy to implement the following feature:
1. You build a prediction model, and you want to see how well it does in real life.
2. Optional - You incorporate the predcition model into a trading model.
3. You specify an out of sample testing period. In this case, lets assume 180 days.
4. A periodic training is specified. This can be every day, every week, etc. Lets assume every day.
5. A model is built up until the 180 days ago. Signals are recorded.
6. A days data is downloaded. Since daily retraining is specified, the model is rereun.
7. Any signal changes are recorded.
8. Steps 6&7 are repreated until all 180 days are done.

There would need to be a few rules, like when the model changes it's mind back to previous days, such as 3 days ago, the change is recorded on the next day.

Re: Walk Forward testing with retraining

Date :9/15/2003 4:37:57 PM Poster : Maxwell Craven

I may not be fully understanding you, but it seems to me that you have described exactly what walk forward testing does, except that I don't understand what you mean by the model changing its mind back to previous days.

Re: Walk Forward testing with retraining

Date :9/18/2003 11:11:11 PM Poster : Alan Rhodes

The first time I read about walk forward testing, I thought the software did what I listed. The second time I read it I interpreted as saying it did not do a true test. I called technical support for clarification and was told it did not do a true walk forward test. I reread the documentation one more time, changed my mind again, and figured I would post here and find out for sure.

I have only only used Neuroshell Trader for 1.5 weeks, so I am not an expert.

As far as changing it's mind: Let's assume I am currently long. When I tried cruder genetic algortithm software, I would reoptimize and it would go short three days earlier. What I am saying those three days do not count towards results.

Re: Walk Forward testing with retraining

Date :9/22/2003 10:13:13 AM Poster : Ward.net Webmaster

We think you may be confusing the Prediction Wizard (which does walk forward testing) with the Trading Strategy Wizard (which only walks forward once.) The Prediction Wizard has an option we call carry forward training that will keep old signals intact when you reoptimize the training. You'll be asked if you want to allow old signals to change or not.

On 9/18/2003 11:11:11 PM Alan Rhodes wrote:
The first time I read about walk forward testing, I thought the software did what I listed. The second time I read it I interpreted as saying it did not do a true test. I called technical support for clarification and was told it did not do a true walk forward test. I reread the documentation one more time, changed my mind again, and figured I would post here and find out for sure.

I have only only used Neuroshell Trader for 1.5 weeks, so I am not an expert.

As far as changing it's mind: Let's assume I am currently long. When I tried cruder genetic algortithm software, I would reoptimize and it would go short three days earlier. What I am saying those three days do not count towards results.

On 9/15/2003 4:37:57 PM Maxwell Craven wrote:
I may not be fully understanding you, but it seems to me that you have described exactly what walk forward testing does, except that I don't understand what you mean by the model changing its mind back to previous days.

On 9/13/2003 1:53:45 AM Alan Rhodes wrote:
I am curious as to whether you can actually test the results of retraining the nets on ones predictions. With walk forward testing, it seems to me it would be easy to implement the following feature:
1. You build a prediction model, and you want to see how well it does in real life.
2. Optional - You incorporate the predcition model into a trading model.
3. You specify an out of sample testing period. In this case, lets assume 180 days.
4. A periodic training is specified. This can be every day, every week, etc. Lets assume every day.
5. A model is built up until the 180 days ago. Signals are recorded.
6. A days data is downloaded. Since daily retraining is specified, the model is rereun.
7. Any signal changes are recorded.
8. Steps 6&7 are repreated until all 180 days are done.

There would need to be a few rules, like when the model changes it's mind back to previous days, such as 3 days ago, the change is recorded on the next day.

Feature Request

Date :9/17/2003 12:43:54 PM Poster : Jon Bebeau

Hi, I'm new to NeuroShell Trader so if there is a way to do this let me know.

Would be nice to display 2 issues on the same Chart. I often compare a stock to an index. I can display the index (the second issue) in a SubGraph but it would be nice to overlay the second chart on the "main" chart (SubGrraph #1). You could use the left side Y-axis for the values and a scale different for the right axis would be necessary. I think this would provide a better compare the seperate sub-graphs.

Jon

Inputs for PCA indicators

Date :9/23/2003 12:59:59 PM Poster : Bertrand Wibbing

Hi,

one interesting thing I came across today:

It is very important for sucessful modelling with the PCA indicators in the NeuroShell Day(Trader) Prof. to normalize inputs with respect to mean & variance.
For a optimum they should have a zero mean & unit variance. Not normalizing inputs could destroy some aspects of PCA analysis.

Good trading to all,
Bertrand

"Best" objective function

Date :9/27/2003 1:27:50 PM Poster : John Gotwals

Does anyone have any comments about choice of optimization objective while optimizing a neural net? To the casual observer, Maximize Return on Account would seem the best choice. But, NeuroShell lists Maximize #Winners - #Losers as the "most recommended objective." Might the choice depend upon the bar frequency, i.e., 5-minute bars versus daily bars?

Re: "Best" objective function

Date :9/28/2003 4:53:23 AM Poster : Bertrand Wibbing

John,

seems like there is no golden rule for this...mostly depends on what your neural net is trying to achive - better should achieve. I have also found the max return on account to be the most universal objective function the Trader offers, but you might simply try them all for your needs. Also it seems reasonable to me to combine at least three nets with different objective functions, once you have found your best inputs with the GA, try to build a metanet with these inputs, but different objectives.

Would be nice if one could "design" a customizable objec. function inside the Trader, so the Trader gets finally a ratio/index which to maximize for best performance.

Best
Bertrand

I have found in my futures trading the winners-losers* profit tends to give useful results though you have to be careful as even a negative value can be positive. The other useful one for me has been the Sharpe one. Overall they seem to be too simple if used on their own, ie one objective will never be sufficient, as an example the maximixe return on acount could give you just one trade over the whole period which may not be what you're looking for. If one could combine the objectives then that would be a great improvement.

Hi Maciej

& thanks for your answer!

Yes, building custom objectives inside the Trader would certainly be highly desirable. In my opinion the GA/TP2 do work indeed great, but sometimes you just don't know how to "communicate" your ideas more effectively with the Trader :-)

One more thing on my big wishlist :-) are some restrictions for the GA - I should define my learning target in points/percent & time spent in the marktet, so that the Trader always catches the right price/time vector... :-)

But nonetheless the Trader does what its supposed to & to experiment with it is fun & a very profitable thing to do...

Good trades,
Bertrand

Hello Bertrand,

Its good to see that you enjoy NSDT as I obviously do.

I've found that the GA optimizes best when I tend to be fairly restrictive in my parameters. I'll even go as far as to say that optimal solution is rarely found by throwing everything at the optimizer and expecting it to triumph. Instead my experience is that by keeping the ranges reasonable and using fewer indicators I tend to get better results. Would that be your experience as well?

Hi again,

yes I do enjoy working with NSDTP much.

After having been tempted (guess everyone starts at this point) to let the GA do my work (with reasonable restrictions it can work sometimes), I took the way back & limit myself to 10 good inputs with some GA work (+-10% parameters) & very few hiddens (rarely over 5-10). Even some advanced regressions do work very well in realtime & I do not overcheck the optimized model before committing myself to it. But the main point is: seek predictive, normalized & very smooth inputs. This will make generalization much more robust. Too much random (noise) features & the model is worthless...just my experience. PCA can enable you to use more inputs with less chance of overfitting. Best of both worlds, so to speak. :-)

Hey Maxwell,

thanks for your interesting comments.

PCA is very nice stuff, especially in connection with various wavelets & filter banks. :-)

Great that you have got good results even on five minute bars, I often use 60mins. Less noise, but also 700-800 bars learning. How often do you retrain? My big net runs every morning while I am at breakfast & smaller ones every hour with ATP2.

I hope you could give me some comments on how you work with NIs, regretfully I have not found the time yet to dive into these...

For myself working with NI is probably easier than with the other nets in so far as the objective is sort of predefined so you don't have to worry about that. Apparently there is a bigger danger of overfitting with these nets but nevertheless I get good results on 5/10 min bars retraining every 2 weeks in most cases. My results have been better with NI than with the other nets . A useful item is the Jurik JMA indicator which does a useful job in smoothing (normalising?) data.

Re: "Best" objective function

Date :10/3/2003 9:36:49 AM Poster : Maxwell Craven

I previously retrained my NI (which really means reoptimizing) about every week. However, I noticed that since mid August the signals I've been getting have been so good I decided "If it ain't broke don't fix it" as they say. So I haven't retrained since then, and my trading equity has been climbing nicely. I asked Steve Ward why he thought that suddenly my NI didn't need retraining any longer, and his feeling was that the last training period I used from about mid June to mid August was perfect in terms of there being no clear trend in the market, so the training set contained a diversity of both bull and bear patterns.

I really recommend you take your dive into NI because I've had very good results from them. I tend to use the recurrent ones.

Hi again,

yes I do enjoy working with NSDTP much.

After having been tempted (guess everyone starts at this point) to let the GA do my work (with reasonable restrictions it can work sometimes), I took the way back & limit myself to 10 good inputs with some GA work (+-10% parameters) & very few hiddens (rarely over 5-10). Even some advanced regressions do work very well in realtime & I do not overcheck the optimized model before committing myself to it. But the main point is: seek predictive, normalized & very smooth inputs. This will make generalization much more robust. Too much random (noise) features & the model is worthless...just my experience. PCA can enable you to use more inputs with less chance of overfitting. Best of both worlds, so to speak. :-)

Best

Hi Maciej

& thanks for your answer!

Yes, building custom objectives inside the Trader would certainly be highly desirable. In my opinion the GA/TP2 do work indeed great, but sometimes you just don't know how to "communicate" your ideas more effectively with the Trader :-)

One more thing on my big wishlist :-) are some restrictions for the GA - I should define my learning target in points/percent & time spent in the marktet, so that the Trader always catches the right price/time vector... :-)

But nonetheless the Trader does what its supposed to & to experiment with it is fun & a very profitable thing to do...

Good trades,
Bertrand

John,

seems like there is no golden rule for this...mostly depends on what your neural net is trying to achive - better should achieve. I have also found the max return on account to be the most universal objective function the Trader offers, but you might simply try them all for your needs. Also it seems reasonable to me to combine at least three nets with different objective functions, once you have found your best inputs with the GA, try to build a metanet with these inputs, but different objectives.

Would be nice if one could "design" a customizable objec. function inside the Trader, so the Trader gets finally a ratio/index which to maximize for best performance.

I've never used the PCA indicators. All I know about them is that you are supposed to be able to condense information into less inputs. Can you explain how you use them?

On 10/2/2003 10:47:18 AM Bertrand Wibbing wrote:
Hey Maxwell,

thanks for your interesting comments.

PCA is very nice stuff, especially in connection with various wavelets & filter banks. :-)

Great that you have got good results even on five minute bars, I often use 60mins. Less noise, but also 700-800 bars learning. How often do you retrain? My big net runs every morning while I am at breakfast & smaller ones every hour with ATP2.

I hope you could give me some comments on how you work with NIs, regretfully I have not found the time yet to dive into these...

Re: "Best" objective function

Date :10/8/2003 3:04:48 PM Poster : Bertrand Wibbing

Hi again Maxwell,

here is some background info I recently found on the net:

"PCA is a geometrical ordination method which is used to compress a set of variables into a smaller number of derived variables or components. It is used to pick out patterns in the relationships between the variables in such a way that most of the original information can be represented by a reduced number of new variables. A useful metaphor is think about a photograph. This is a 2-dimensional representation of a 3-dimensional object. As long as an appropriate camera angle is chosen little information about the subject will be lost. Thus, the original 3 dimensions can be compressed into 2 dimensions with little information loss.

As with all statistical techniques there are assumptions about the data. The main one is that the derived components are normally distributed and uncorrelated (orthogonal). If PCA is being used to test statistical hypotheses the assumptions should be valid. The assumptions are less important when PCA is used as a descriptive and exploratory tool. In practice, if the principal components are normally distributed the assumptions may be considered valid."

Interpreting the above statement for use with the Trader you can use the PCA indicaotrs to "compress" your data/indicators, feed them different inputs & use the vectors with the highest variance (most information content to model with) as inputs to your net. It does need some experimentation as all modelling issues in the Trader. If you are serious about modelling with these tools, make sure you normalize the inputs before the modelling stage. This refers to the last statement in the citation above. Use Z-Score to achieve zero mean & unit variance.

Best & good modelling,

Bertrand

Automatic Trading

Date :10/13/2003 1:45:45 PM Poster : Rick D

I am intersted in using the signals generated by my neural net in NST to automatically trade (hands off) futures contracts. I believe this can be done by exporting data from NST to TradeStation7, and then using their automation system. Can anyone share any other methods (or software packages) they have used to automatically trade NST signals?

Thanks,
Rick

Re: Automatic Trading

Date :10/16/2003 10:32:17 AM Poster : Michael I

Rick,

you can use NSTrdImport function that comes with NST. Inside your TS strategy you can obtain value of any datastream present in NST chart, including out-of-sample predicted value, compare them with thresholds, etc. and make trading decisions inside TS strategy. The trouble is, NSTrdImport now (since release 4.3) is not officially supported. I works reasonably well in my limited experience, but I wonder if I would feel comfortable doing real trading with something that vendor says is unreliable and unsupported. The best I could come up with so far is using TS alert facilities (unlike NST, there you can use paging and emails) to let me know when signal gets generated. Of course, if you consider trading smth like 3min bars, this could very well be a problem. I think we should ask Ward Systems to look deeper into NSTrdImport problems and not to withdraw support.

Cheers!

Michael

We really wish we could support the import. It worked fine with TS6 when we first introduced it. However, it no longer works reliably for us after the latest TS7. We think TS introduced a new multi-module architecture in TS7 that no longer permits reliable import from Trader, which is of course another competing module. We left the function in for those who can use it without problems, but after many hours we have still been unable to get TS7 to use the data all the time, even though we know it is getting there all the time. It appears to be a timing issue. The export from TS7 to NeuroShell still works fine.

The data exchange addon was actually built primarily for exporting trading signals to a program. There is an example written in Visual Basic that accepts those signals. All one would have to add to the program is a way to send the trade to your broker. We know that Bowfort Technologies has built similar programs for users:

http://www.neuroshell.com/addons.asp?bowfortcustom

Neural indicators and bar frequency

Date :10/21/2003 6:03:46 PM Poster : John Gotwals

Can anyone offer any rough generalizations about neural indicators and optimum bar frequency. A week or two ago on this forum, someone mentioned, in passing, that he was using 60-minute bars to reduce the amount of noise.

I am wondering if the trading volume affects the usable bar frequency, i.e., if you are trading a high volume stock like IBM would there be less "noise" at a given bar frequency than for the case of a lightly traded stock? Similarily, would exchange traded funds such as Spiders and Diamonds have less noise, at a given bar frequency, because of their composite makup and (in many cases) heavier trading volume?

Any comments would be greatly appreciated.

Re: Neural indicators and bar frequency

Date :10/22/2003 4:16:35 PM Poster : Maciej

Whatever the frequency bar you may wish to try to normalize the data in order to minimize the effect of noise. One such techique that I use is the average of high/low and close (there are other pouplar variants) or else I use something such as JMA to try to filter out any noise. The JMA method is quite useful. As for which instruments to use then avoid non-liquid ones unless you like surprises. The ones you mention should be quite reasonable for NI use. I use 10min for some liquid commodities and for the DJ (diamonds) 05min bars but then I'm looking for short term action. If you like being glued to a screen that sort of frequency is fine.

Re: neural indicators and optimum bar frequency

I don't think that your issue is related to neural indicators, but rather to the nature of price fluctuation. Increased volume in a stock generally means that the volatility has also increased. For example, the opening timeframe typically has the highest volume of the day and is also one the most volatile periods of the day. Latter in day when volume dries up prices barely move.

Many of the systems that I have develop perform better at longer time resolutions (e.g., 15-30 min) when compared to shorter resolutions (e.g., 1-5 min). For me this is a fact of life. You look at the realtime fluctuations of a tick chart compared to a 30 min charts you will see that the relative changes are far greater on the tick chart than the longer time frame chart over the same timeframe. If one uses the standard deviation of price data to measure the "noise" or volatility, then you will find that it increases at approximately the square root of the time resolution (i.e., 30-min data it is about sqrt(30) times larger than what it is at 1min). I think this has something to do with it (i.e., volatility is only sqrt(30) larger not 30 times larger).

For myself I find that profitable short timeframe strategies (1-5 min) can only be achieved by thinking out of the box. Try using counter-intuitive strategies; take partial profits quickly; look at using limit orders to eliminate slippage, etc.

Trading not as good as training results

Date :10/28/2003 2:05:39 PM Poster : Matt Jarvis

I have a developed a neuronal net that I have been trading now for about 2 months. During those 2 months my return on the dollar has been only about 8.5% after commissions (about 51% on an annualized basis), but I got much better returns when I trained this net, more like 120%. Can anyone give me some tips on what I might be able to do to get the returns more like what they were during the training portion? Why doesn't it stay at the same level?

Re: Trading not as good as training results

Date :10/29/2003 6:23:30 AM Poster : Bertrand

Hi Matt,

here are some things the come to mind, but I guess what you have just written is in a way normal for trading with NNs. These are issues you have to deal with...

1. Try to reduce & also smooth your inputs (5-10 max.). This may reduce noise in the system, which is most often good for better generalizing of the net.

2. Try reducing the number of hidden neurons of the network model, extensive use of hiddens combined with a high noise level will certainly lead to less tradable results. I'll always try to keep as much hiddens as inputs in my net. Sometimes (in some indicator predictions for example) even a linear model or a net with just one hidden will deliver the best overall results.

3. Try to change your target function & also your objective function. Do the target & trading functions reflect your trading style for the net?

Hope that all goes well & maybe you'd like to post your progress & findings!

Best
Bertrand

1. Be sure that when you train you are using the same commission and slippage that you actually experience in real trading. Slippage can drastically reduce your actual profits.

2. Two month of actual trading is a very short time; what you are experiencing may just be sample variation. I like to train with years of data covering various types of market conditions. If you look at the monthly returns of systems over a period of years you will notice that they are in general not constant month to month.

3. Finally, analyze how you system traded over the same two months compared to your trading results. If your system is getting same returns as you achieved in real trading, then it has failed an out-of-sample test and you have to go back to the drawing board.

Hi there,
i don't know what type of trader you are (day trader, position trader etc.) and what type of data have been used (i mean dayly, intraday data). However, in my opinion your trading strategy (system) is quite good if your return on the dollar has been 51% on an annualized basis (after commissions) in real trading.

Steve Ward's Trading Method

Date :10/30/2003 2:01:16 PM Poster : John Gotwals

I would like to thank Steve Ward for posting information about his trading methodology in the Tips and Techniques section. I found his presentation very interesting and it has given me several new ideas which I plan to investigate for my own use.

If I read his posting correctly, it looks like Steve makes one round trade a day beginning shortly after 10 AM and ending at 11 AM. I can understand the use of the 10 AM entry to avoid the opening gap effects, but why the exit at 11 AM?

Re: Steve Ward's Trading Method

Date :10/31/2003 10:31:31 AM Poster : Steve Ward

You are welcome. I do usually trade only once per day because of the demands of this job (even though our company policy allows personal trading during work hours if NeuroShell is utilized!). Also I believe you can get more accurate models if the nets are allowed to concentrate only what to do at a specific time. However, those times were only examples. I use and have built models for many time periods. I have also in the past allowed the optimizer to tell me what time is best.

A key issue for me is how to move from essentially random trial and error models, based on reuse of examples and tips, plus emotional stock selections to some structured and systematic approach to both model development and trading instrument selection.

My experience tends to one of frustration - model optimises with normally good historic results but mediocre paper trading, generating 'so what shall I try next'. Ideally I would like to learn move from one model to the next based on something more than just random subsitution.

Clearly my stock selection could be optimised around some rule based screening - this in itself might make an interesting add-on product opportunity.

So my question (finally) is how do people structure their use of NST to systematically build profitable trading models?

Re: "So my question (finally) is how do people structure their use of NST to systematically build profitable trading models?"

Here's my process that I previously posted at another site. I develop my strategies in both NST and TradeStation, so what follows applies to both:

My strategy development process is best described as evolutionary (i.e., each major version incrementally improves upon the previous version). I use many tools (e.g., Excel, MathCad, NST, Genetic Algorithms, TradeStation, analysis programs, compilers, etc) In the development of a strategy. Additionally, I have developed standardized data sets that represent different types of market conditions (e.g., bullish, bearish, choppy, etc.) I have different data sets for development (optimization) and validation (out-of-sample).

This requires that I maintain configuration control over these data and analysis results. I do this by labeling each major strategy with a code name (e.g., Downhill) that I use as the title for its "master" folder, that is kept in a separate directory. Each major version adds an extension to the code name (e.g., DownhillSkier) and a subfolder of the same name to the strategy's folder. All charts, functions, indicators and signals specific to a project/version start with the code name and are kept in the NST and/or TradeStation directory.

For myself the "Best Practices" for strategy development consists of the following phases.

1. Requirements Definition

2. Analysis

3. Design

4. Coding

5. Test and Validation

For me these are iterative, I make several passes through them for a given strategy.

REQUIREMENTS DEFINITION. This is a key step. Some of these are obvious, but it is important to document them. Some of the things to be defined include:

Strategy Context:
What market is to be traded? Is only one security (e.g., QQQ) or several to be traded?
Is the system for intraday or EOD?
Specific Timeframes: First hour only, last two hours only, first/last three days of month, etc.
Will positions be held overnight?
What is the Time in Market (always in or percent of time in)?
How frequently shall it trade?
Will the system be used for mechanical trading or as a decision aid for discretionary trading?
If mechanical, will orders be entered manually or automatically?
Will the system include Money Management, position sizing, etc?

Define Acceptance Requirements:
Equity Curve shape (linear, from Lower Left to Upper Right). (For NST I copy the trades to the clipboard and then paste them into Excel to create an equity curve chart and for additional analysis).
Maximum allowable drawdown (%).
ROA (%)
Percent Win
Ave Profit/Trade
Etc.

Define Test Conditions:
In-Sample and Out-of-Sample Data Sets
Commission rate
Slippage
Trading Size

ANALYSIS. Outside of test and validation, this the most critical step. For me this is where most of the work is. This step defines what type of system you are going to develop (Breakout, Trend Following, Reversal/Retracement at support/resistance, hybrid, etc). It is here that one defines the setup, entry, exit, and stop conditions of the strategy. The end of result of this stage is a detailed functional description of the strategy. Admittedly, a lot of this effort resembles a random walk. I've found it crucial to keep good notes of what works and doesn't and in what timeframes and market conditions.

Review Existing Strategies. Review strategies in books, journals, and on the net. Walk through the code to understand the strategies. Test with you test conditions and data set. Document the results.

Chart Reading. In this step one reviews the chart of the Data Set at various time resolution, with and without canned indicators (e.g., CCI, Keltner Channels, Stochastics, etc). Step through the data looking for patterns. Are there obvious entry/exit conditions? Don't kiss this effort off. I have found it instructive to step though years of 5-min data by right clicking the arrow key, exposing one bar at a time. Try different indicator parameters. Document your observations. I have found that capturing screen shots and pasting them in to a word document with my annotations is useful.

Data Mining. In this step one attempts to identify relationships that can be used to develop setup, trading rules and strategies. One attempts to find relationships and patterns between bar data (O, H, L, C, V) at different time resolutions with other data streams, and with processed (e.g., indicator) data. This analysis uses TradeStation processed data as well as other analysis tools such are Excel, MathCad, statistical, Genetic Algorithms (including GeneHunter and home grown), clustering analysis, and other exotic analysis software. See Chap 8 of Pruitt & Hill (Building Winning Trading Systems) and Chap 5 of Stridsman I (Trading Systems that Work) for some techniques and ideas. Draw conclusion as to what works and document it.

Prototypes. Development of a prototype of a strategy component with an attached instrumentation package is a productive effort. This is a good way to test ideas developed above.

Trade-Offs. Use the prototype and analysis tools to trade-off various strategy options (i.e., use of stops, profit targets, etc.

Functional Specification. Formally document exactly what the strategy is to do with all the parameters and logic that is to used. Identify what parameters may be optimized, these are the inputs to the strategy.

DESIGN. In the design phase one defines what functions, indicators and signals are to be used or developed. This is an iterative process.

Functional Decomposition. Identify specific functional areas within the strategy. E.g., Initialization, OpeningSignal, BreakoutSignal, ReversalSignal, EntryMgmt, ExitMgmt, SizeMgmt, Instrumentation, etc.

Use Analysis. Determine which functional areas depend upon each other. Draw a hierarchical chart showing the dependencies and data flowing between them

Reuse Analysis. Identify if a specific functional area can be satisfied by using existing functions. Also determine if any of your original functional area are candidates for reuse in other indicators or strategies.

Identify Functional Modules. Identify which functional area will be implemented as functions or DLLs.

Function Variables. Identify inputs, constants, internal variables, global variables and arrays.

Trace Requirements. Trace each Functional Requirement into one or more functional modules.

Pseudo Code. Write pseudo code (in EasyLanguage, if using TradeStation) for each function, indicator and signal to be developed. Identify all inputs and outputs and outline logic flow using comments. Paste functional requirements in as comments. One can cut and paste code from your prototypes or other existing strategies as necessary.

CODING. Complete the code based upon the Pseudo Code and verify. Apply your coding standards. Each function shall be independently tested and debugged.

TEST AND VALIDATION.

Test. Test the completed strategy with the specified in-sample Data Set.

Optimize Parameters. (If required). Step through optimization results and compare with the Acceptance Criteria established in the Requirements Definition. Document which parameter sets are acceptable. Capture Screen shots of the Equity Curve and Performance Summary and save in documentation. Identify one or more Best-of-Breed candidates for validation.

Validate. Validate strategy with out-of-sample data set. Compare results with the Acceptance Criteria. Capture Screen shots of the Equity Curve and Performance Summary and save in documentation. Down select to Best-of-Breed.

Post-mortem. Identify where the equity curve needs improvement, and from that the specific trades. Use the instrumentation to analyze what your indicators where doing at that time. Document your observations and go back to the Analysis Phase.

Paper Trade. When your strategy has met you acceptance criteria, paper trade it in realtime as a second validation.

Final Release. When satisfied, remove instrumentation, rename as required, and verify code.

==========

You have mentioned that two of your favorite indicators are the spreads of the Turning Points addon
PeakProp - ValleyProb
PeakProbB - ValleyProbB

When you optimize these sets of indicators, do you link the corresponding parameters in each pair?

Re: Steve Ward's Trading Method

Date :11/4/2003 10:45:25 AM Poster : Steve Ward

No, I've never done that. Try it and see if it helps.

Your result are surely good, but I would like to know if you are trading stocks or futures. I have got even better results using futures, but only on paper until now. That's because with futures you calculate performances as % on margin+ drawdown, and you've got to be very sure of the stability of the trading system before pouring money into it, otherwise you are going to be wiped out.
I hope someone else will reply too, I am just wondering how many people have been able to reach a good reward/risk ratio without going into intraday trading (because I would have to live my regular job in order to daytrade!).

I would guess that Matt's results are stocks - if you take Steve Wards method for the ES as an example you should be able to achive an annual return of 758% in training with 59% win ratio. I seem to have no great trouble in getting good results with optimization - the tricky bit is as you are finding out making sure that that training is relevant in the immediate future: that's tough! I'd suugest that you try putting in some stops if you haven't done so to see if you can improve matters.

Thank you Maciej for your suggestion. Matt's results on stocks are definitely good (if they are stable). I generally avoid optimization, according to my experience it usually produces bad out-of-sample results. I look very much at the equity curve, especially at the out of sample part, in order to judge about the tradability of a system. I will try with some stops even if I am rather sceptical about them, I read once an article by Larry Williams on the web that showed that tightening stops produced a worse reward/risk ratio. It' true that the article dealt with a trend-following systems on the Japanese Yen, always in the market, long or short. Maybe a neural network could behave differently, that's why your suggestion is worth trying.

NSDT will confirm Larry's ideas. That doesn't mean that you can't make money with tight stops - only less! However seeing some of the drawdowns on futures with looser stops is tough to trade without squirming. Larry was in any case generally discussing trades over several days and tempered these ideas with a) no stops on the day of the entry [I believe on account of the sofware he was using for testing] and b) he used a so called "bail out" technique which got him out fairly quickly.

In reply to strategist, I'd suggest that there should be no problem in avoiding the need to day trade but that you have to bear in mind how NSDTP (and it seems a lot of the other software as well) works. Namely stops and such like do not normally react in the entry bar so if you're using daily bars then there are effectively no stops on that day - risky and in my case for futures not acceptable. What I do with my testing is to use say hourly bars but treat my system as if were a system based on daily bars. That way I can minimise this first bar issue. I personally find that such an approach is more realistic. The alternative would be to accept stops on the first bar that I personally could never afford to take.

Re: Position trading

Date :11/13/2003 9:36:37 AM Poster : Ward.net Webmaster

That is partially true. That IS true for The trailing stop indicators that
rely on the entry price in their calculation. However, this is NOT true for
indicators like Min(Low,5) which do not need the entry price. The
indicators like Min(Low,5) when used as stops WILL be in effect on the entry
bar when a Market Order entry is used.

May be from a CTA point of view a good performance is anything with a Sharpe ratio better than the market's, that is, anything that performs better than SP500 with equal volatility, or performs as SP500 with less volatility. But from the point of view of a futures trader like me, "good" means a system that can yield at least 100% per year on margin/+drawdown, with an acceptable volatility. Most important of all are a smooth equity curve and maximum reliability as time goes by. The last point is not only a matter of statistics: past performance does not assure future performance.

It seems that this forum is going to be a "Daytrader forum". Is there anybody still using the end-of-day Trader with good results?

Re: Position trading

Date :12/11/2003 3:15:08 PM Poster : Michael Stigall

I still work with NST charts which use end-of-day data for generating entry signals. The exit signals may be either end-of-day or intraday, depending on the underlying equity. I have several friends that bombed out as day traders over the last four years, and I never want to be glued to a day-trading screen.

DDE Server?

Date :11/2/2003 3:37:57 AM Poster : Rolf Edberg

Under the headline "Changes in documentation" there is a document about DDE server. My data-server is not in the DDE Server-list so I have to set up my own data-server. The instructions to do this is: "Nr 1.Select in the DDE server list."

My problem is that I do not have that option.

I have version NSDT 4.3 and I have copied the Dynamic Data Server.exe over the old file.

What shall I do?

Re: DDE Server?

Date :11/3/2003 10:25:43 AM Poster : Ward.net Webmaster

We think you are ok if the date of the Dynamic Data Exchange Server.exe is 10/13/2003. The one on our web site is actually more current than the one distributed with 4.3 (which doesn't work), so it was correct for you to move it.

The next thing you have to understand, and our documentation didn't mention it at all, is that you run this program from the Windows Explorer, not from NeuroShell. Use the Windows Explorer and find the c:\NeuroShell Trader 4\Servers directory. Double click on the file named Data Exchange Server.exe to begin running the server. Click on the Setup button and look for your server on the list box beside DDE Server. If it is not there (which it probably isn't), you'll have to build it. Follow the rest of the instructions in the help on this site for that, including how to add symbols. If the instructions are less than clear to you, let us know, because we are going to try to make them more clear. However, every feed will have a different set of settings, so we can't really lay out exactly what to do for a feed with which we are unfamiliar.

Once you are ready to test, that is the time to select the DDE Server in NeuroShell. First bring up your data feed – it has to be running in advance, and it has to be set up for DDE (whatever that involves with your feed). Go to the Tools Menu, Data Sources, Server tab and select Dynamic Data Exchange Server. The NeuroShell Trader will then use the Dynamic Data Exchange Server as a data source using the settings you have provided.

On 11/2/2003 3:37:57 AM Rolf Edberg wrote:

NSTP built-in indicators in a DLL

Date :11/5/2003 9:58:42 AM Poster : lsmo

Is there a way to use NSTP indicators like RSI, MACD... in a DLL?

Re: NSTP built-in indicators in a DLL

Date :11/5/2003 2:03:56 PM Poster : Ward.net Webmaster

Yes you can use them if your pass their data streams in as parameters of your DLL. You can pass any datastream in NeuroShell to a DLL. You can't call them directly from your DLL code, however.

On 11/5/2003 9:58:42 AM lsmo wrote:

PowerBasic Indicators Based on Multiple Instrument Data

Date :11/20/2003 5:57:35 PM Poster : Yngvi Hardarson

Has anyone here programmed DLL indicators based on multiple instrument data using Power Basic?

Re: PowerBasic Indicators Based on Multiple Instrument Data

Date :11/21/2003 9:34:07 AM Poster : strategist

I have not yet programmed such indicator really, but knowing how it works I can say that it's not so difficult. You have just to program the proper number of inputs in the DLL, and then setting consequently the external DLL call in the Trader, e.g. assigning to input number x the close (or anything else) of another instrument of your choice. It's the same as using an indicator as an input.

On 11/20/2003 5:57:35 PM Yngvi Hardarson wrote:

Rel 4.3 - To updat or Not?

Date :11/21/2003 3:57:15 PM Poster : Maciej

The new release (4.3) deals with a fix to the TradeStation interface. Does anyone know if that means that it concerns only those types of users or are there some bug fixes applicable to all?

Re: Rel 4.3 - To updat or Not?

Date :12/3/2003 8:08:43 AM Poster : Ward.net Webmaster

It contains only fixes for TradeStation export. Other 4.2 users may want to wait for 4.4 to update.

Clarification seeked on "Evaluation" and "Out of Sample" periods

Date :12/12/2003 4:11:13 PM Poster : Michael Imas

I have a question regarding training and out of sample periods.

One task I perform is analysis of how well predictions hold up out of sample.

For that, I use "Evaluation Set" data.

Let's say I train predictions using X days of training data and then evaluate them on the subsequent Y days which are out-of-sample. Moreover, I attempt to predict output 10 days into the future.

That means there is a 10 day period between "Input End Date" of training set and "Output Start Date" of evaluation set. While data from that 10-day period is not used for inputs of training set, you still need that data to create this prediction (simply because training of neural net requires "answer" from that period to calculate error or other objective).

Since the data for that 10 day period is required to create the prediction, you can only create the prediction only once that 10 day period is over. Yet, if you look at "Trade by trade" tab of "Walk Forward" period, NST makes trades within that 10 day period and considers them out-of-sample.

In real life trading you simply would not be able to obtain that prediction until this 10-day period is over. As such, these trades cannot be, in my humble opinion, considered out of range.

Please let me know what I am missing.

Thank you very much.

Michael Imas

Re: Clarification seeked on "Evaluation" and "Out of Sample" periods

Date :12/14/2003 8:29:37 AM Poster : Matt Jarvis

My understanding is as long as you have inputs you can make a prediction. You only need the output to train those bars. So as long as it wasn't trained on those bars it is out-of-sample. At least that's what I think I learned in graduate school.

On 12/12/2003 4:11:13 PM Michael Imas wrote:

Predictions unstable in real-time

Date :12/31/2003 6:01:12 PM Poster : Michael Imas

I wonder if anybody encountered the following bizarre behavior in applying previously trained predictions to real-time data (sourced from TradeStation via NsTrdExport indicator).

I start Tradestation and Neuroshell Trader, then open a previously trained prediction. The prediction chart is updated with the latest data in real time. I was expecting trading signals to be generated on the last bar as soon as it was completed. To my surprise, signals often appeared or disappeared on much older bars (10-40 5 minute bars ago). For example at 1pm I get a signal to reverse from long to short position. I reverse. Then at 1:30pm I notice that the 1pm signal has disappeared from the chart, and the prediction is still in "long" position. I immediately reverse again to be in sync with the prediction. Then at 2pm I notice that a reversal signals has appeared on the chart at 1:15pm. At 1:15pm, however, the signal was not there - it just appeared later. To say the least, such behavior is extremely disconcerting. It looks as if Neuroshell continues to optimize the prediction using the real-time data (I don't explicitly re-train predictions in the middle of a day).

It has been suggested to me that Tradestation changes data on the past bars (e.g. it could change "Close" for 1:05 pm bar at 2:05 pm). While this actually does occurs in rare cases, this was not the case today (I started saving data in files at various times through the day, then compared the data sets; historical bars did not change). So this does not explain the above. Also, the instability is rather extreme, the prediction changes its recent historical trades 4-8 times a day and thus is impossible to follow. Small changes in past data should not trigger that.

Regarding the prediction, it uses 5-min data streams for SPY and QQQ's, and uses linear regression, lagged linear regression, etc. - nothing fancy. I don't use "Lead" indicator or Peak/Valley indicators, I know those can change after the fact. I predict % Change in Open of SPY.

Did anybody experience something similar? Predictions look good in Walk-Forwards, but this instability makes it impossible to trade.

Thanks a lot!

Re: Predictions unstable in real-time

Date :1/2/2004 9:30:14 AM Poster : John Gotwals

I have been having a somewhat similar problem, but far less severe. I have observed, and reported, a situation where I am using recursive neural nets with turning point indicators and using time flags to force one trade per day. On occasion, perhaps every 2nd or 3rd day, I will observe a buy or sell which had occurred on an early bar, such as the 2nd or 3rd bar, to suddenly reverse later in the day. To catch these situations during paper trading, I always write down the initial order so that I can rule out the case of failing memory on my part. This problem has occurred when I have been using 5-minute bars.

I have not pressed Ward Systems about this matter, other than the initial report, because the problem is sporodic and probably difficult to duplicate.

Re: Predictions unstable in real-time

Date :1/2/2004 12:53:34 PM Poster : Ward.net Webmaster

Actually, Turning Points is another of those indicators which sometimes DO change with new data, as we have noted in our documentation (although the note was probably added a month or two later than your copy - we'll send you a new help file, which was all that changed in May 2003). We'll have to get Michael Imas' chart to see what is happening there with TradeStation.

I went back and read the Overview portion of the Help file for the Turning Points indicator, and with chagrin I have to acknowledge that the statement you are referring to is present and indeed is quite explicit about this fact. The Help file states:

"New data can change the location of the most recent turning point. For example, suppose the last turning point is a peak. Then suppose as more data arrives, and a new higher peak is found before a valley is found. In that case, the last turning point will be readjusted higher. If you have built a trading strategy based on any of our indicators in which the location or value of the most recent turning point is involved, it is possible that a signal already on the chart will move or even change."

I thank you for your help on this matter.

Re: Predictions unstable in real-time

Date :1/14/2004 11:18:21 PM Poster : Greg Kramer

I once had a DLL that I had written which did the exact same thing, except that I only used it as a indicator or in a strategy, never in a Prediction. I concluded that some how the DLL was "looking ahead" (i.e., Leading). I sat down and walked through the code until I found the line of code that "looking ahead" of the current bar. For the current bars it was using "noise" somewhere in memory. But after a few bars, the calculation was only using real data; and if it affected the Buy/Sell thresholds, the strategy would change after the fact.

Based upon this, I would conclude that your Prediction is somehow using Leading data. It could be in:

1. Any of the inputs you developed.
2. The built-in indicators that your are using
3. The Predictor code itself
4. Your data source is changing previous bars.

Since, others haven't experience the problem, items 2 and 3 are improbable; unless you are using a infrequently used built-in indicator.

TURNING POINT ADD ON

Date :1/12/2004 3:36:47 PM Poster : TURNING POINT ADD ON

Does anyone use the TP support and resistance for breakouts? I am looking into this but struggling a little. It seems to make sense.

Re: TURNING POINT ADD ON

Date :1/15/2004 8:51:28 AM Poster : chris wong

it sounds like a very good idea to me. i would think you need imaginary probability channels. if the price breaks above a high probability of a peak without turning, then you have an upward breakout. if it drops below a high probability of a valley without turning, then you are breaking out below. you could use optimizer to decide probabilities but i would guess probabilities would make themselves obvious by inspection.

Trying using a logic of going long when crossing above support and getting out when the PeakProbability Bars is close to 1. Reverse this process (using resistance and ValleyProbability Bars) for going short. Should give you interesing results. It amounts to a channel approach but it seems mathematically superior. I further smooth the price to reduce the trades.

Jurik Warning

Date :1/30/2004 5:55:35 AM Poster : Maciej

Those that have the Jurik package know that a software key is required for each and every machine on which the software is to be run on. What may be less known is that this key seems to be based on the BIOS of the machine with the obvious inconveience that everytime the BIOS is updated one has to go cap in hand and request a new key (they email response suggests that this key request is processed once a day).

To make matters more complicated if you decide to upgrade your machine then Jurik insist on seeing the invoices for the new machine (they haven't as yet asked for proof of the destruction of the old one- no doubt that will come)!

As in our case the NSDT key is literally the key that allows us to run the Jurik addon then it would be helpful for Ward Systems to work with Jurk to find another more pactical manner of protecting their legitimate intrests.

Note that in my experience this method employed by Jurik is the most inconvenient one that I have come across!

Re: Jurik Warning

Date :1/30/2004 10:50:47 AM Poster : MFK

Maciej: Wow, your experience is exactly the opposite of mine. I just upgraded my computer, called Jurik for a new key, emailed the information they requested (serial or registration number of some sort, easily found in program) and got new key by return email. Couldn't have taken more than an hour, start to finish. Can't believe they've changed their policy in last two weeks. Try again. Maybe you just talked with the wrong person. Good luck.

Re: Jurik Warning

Date :1/31/2004 3:46:25 PM Poster : John Gotwals

I have had the same experience twice with Jurik. The first time I bought a new machine and Norman Smith gave me a replacement key, but he told me in the future I must FAX him the invoice for the new machine.

My second incident was when I updated the BIOS and called Jurik for a replacement key. I was nonplussed when Mr. Smith rehtorically asked me "Why would you want to update your BIOS?" In both cases, even though I had phoned in a key request, the replacement passwords were e-mailed to me after several hours had lapsed.

While I would never even think of doing such a thing, treatment like this might encourage some customers to reverse engineer the software and remove the BIOS check!

Enhanced Fund Switching from TASC

Date :2/2/2004 2:00:55 PM Poster : Bill VanDyke

Hello,

I downloaded the Enhanced Fund Switching tip from TASC (Oct 2000). It creates 2 indicators called RetraceBuy and RetraceSell. The webpage where it's described says: " (i.e., put both indicators in a trading strategy, one for buy and one for sell)."

My question is....to put them into a Trading Strategy, does one use the condition of A=B and make RetraceBuy = RetraceBuy for the Buy condition? For the Sell, should one do the same but use RetraceSell?

I don't know whether to use A=B or some other condition (such as RetraceBuy > Close), for example, as there was no Trading Strategy with the tip. I've just upgraded to the Professional version & learning a lot...and any help will be appreciated. Thanks in advance.

Our newsletters

Date :2/3/2004 4:44:15 PM Poster : Ward.net Webmaster

Last Friday Jan 30, we sent out our January newsletter. We were astounded to see how many were bounced back to us as undeliverable, either because of unknown address or because spam filters didn't like it. So if you didn't get our newsletter, think if you've changed your email address since you purchased our software and didn't tell us about the change.

Also check out how sensitive your spam detection is. Good spam detectors should keep the filtered spam somewhere so you can check it. Maybe you'll find our newsletter there. The joke around here is that if we were to put extra letters randomly in all our words, the newsletters would probably easily get through the spam filters!

Generalize on optimal walk forwards

Date :2/4/2004 4:14:56 PM Poster : MFK

In the Tips and Techniques titled "using generalize on optimal walk forwards," you make the suggestion to "select no walk forwards, but select optimal walk forwards instead." Do you have any recommendations concerning the number of optimal walk forwards to use and the number of periods those walk forwards should include? If we're trying to find the walk forward "that worked best later on," is it better to have a larger sample to select from?

Re: Generalize on optimal walk forwards

Date :2/5/2004 6:31:07 AM Poster : Maciej

I use 6 of 1 month and this tends to give me good results in futures. To be fair I've arrived at that figure more by luck than real judgement. My feeling is that you are right in believing that a larger sample is better ie 6 of 1 month should be better than 2 of three months..

On 2/4/2004 4:14:56 PM MFK wrote:

Re: Generalize on optimal walk forwards

Date :2/5/2004 9:04:04 AM Poster : Steve Ward

I'm not sure I should call this is a recommendation, but I only use one walk forward in my personal trading, and I set the length to something I think is appropriate, like 3-6 months for daily bars, 1 to 3 weeks for 5 minute bars.

On 2/4/2004 4:14:56 PM MFK wrote:
In the Tips and Techniques titled "using generalize on optimal walk forwards," you make the suggestion to "select no walk forwards, but select optimal walk forwards instead." Do you have any recommendations concerning the number of optimal walk forwards to use and the number of periods those walk forwards should include? If we're trying to find the walk forward "that worked best later on," is it better to have a larger sample to select from?

Re: Generalize on optimal walk forwards

Date :2/5/2004 1:49:40 PM Poster : Maciej

My approach has been based on the expected duration of a trade. I expect my trades to last a maximum of 5 days so if I use one month and am aimimg for a 60-70% hit rate I should be able to get 2-3 succesful trades in a period of 1 month.

Global Variables

Date :2/5/2004 6:38:06 AM Poster : Maciej

One of the most useful features in rel 4 for me has been the ability of setting named variables.

However I would like to see these variables extended so that one could use the same variable throughout the chart ie in a prediction, in several trading strategies.

The reason for this is to make the creation of systems eaven simpler and above all more reliable. I find myself making errors by not setting a variable correctly. By using such global variables one would be able to reduce the risk of erroneous parameter settings.

preventing over optimization

Date :2/5/2004 11:35:31 AM Poster : MFK

In Steve Ward's recent tips and techniques post, he suggests trying "to get an equal amount of 'bull' as 'bear' in your training and optimization period." Does anyone have any evidence/experience that using the "Adjust training set for trending markets . . ." function (on Training tab of Prediction Parameters menu) can produce this sort of bull/bear data splitting?

about R-Square

Date :2/19/2004 11:28:41 AM Poster : Li Chuan-Lien

hello:

Any body know ?
I use the NeuroShell Trader Professional to prediction Taiwan's Stock.
But why my training data that show's R-Square is very low?
My R-Square is about 0.00XXX.
What about your's R-Square?

Re: about R-Square

Date :2/19/2004 4:48:29 PM Poster : Bertrand Wibbing

Hi Li,

what do you try to predict?

In other words: what is your desired output & how many bars ahead?

Generelly I do not put too much weight on statistical measurements, but judge outcomes of the Trader in terms of practical "tradability", if it has merit, I'll go for it...

Best to you & your trading,

Bertrand

Thank Mr.Bertrand and Maxwell

I want to predict the taiwan's stock. (taiwan's listed securities)

Because I want to analysis the taiwan's stock use the NST that maybe can give some good trades for me.

My output is "Optimal Percent Change in Open", "3 trading days into the future from the next open".

And hello Bertrand:

You write that "how many bars ahead".

I don't know what your mean.

Can you explain again for me, please?!

thanks a lot

Hi Enery :-))

Mr. is absolutly not necessary :-)

So, here are some tips that came to mind while reading your post:

1. First smooth the Open, then try to predict it, percent change is a good start, maybe you also like some indicator, oscillator -> try also predicting it a half cycle ahead.

2. Do you only want to trade your portfolio of stocks on that prediction? Add some more confirming indicators & let the nets be one tool of your box, I know many people search for the holy grail buy/sell out there, but I am happy being now of that way...I think you can use the Trader much better for pattern classification. Just my opinion, because this approach may be much more stable & relaxt from a practical trading perpective.

3. With bars ahead, I simply meant the prediction horizon you enter in the prediction wizard or directly in the addons...

4. To get a much better feel for what your nets & predictions are "realtime worth" chart the net directly over the desired output (in your example: optimal percent change in open), not shifted ahead x bars. A % percent error or some R Squared are valid measurements, but as they are somewhat dependent on the correct probability distribution to make clearcut statements I would not put to much weight on them.

All my best & if questions pop up, let us know...this forum has gotten a bit "sleepy" for my taste :-))

C code generation for predictions

Date :2/21/2004 6:52:28 PM Poster : Rick A

I'm a new customer using NST Professional and first off would like to say hello and thanks to the folks at Ward Systems for producing such a fine software product!

I've been working working with University software, which allows you to create/train/examine/experiment neural networks. One nice feature of the package: it exports a trained network as a "C" language program. The exported program implements the network, feeding a set of inputs through the hidden and output units by way of the activation functions and biases arrived at through training.

Is there a way to export such a program or its equivalent from NST?

Re: C code generation for predictions

Date :2/22/2004 7:12:14 AM Poster : Ward.net Webmaster

Thanks, and welcome aboard. In addition to NeuroShell Trader, we sell 3 business and science neural network software packages: NeuroShell Predictor, NeuroShell Classifier, and NeuroShell 2. Nets from all of these can be fired from NeuroShell Trader Professional or DayTrader Professional (see the indicator category called External program and library calls). NeuroShell Predictor and Classifier allow nets to be "exported" by DLL or OCX call, and NeuroShell 2 (which is now aimed primarily to students, professors, and universities) does export neural nets in C and Basic source code as well as DLL. However, NeuroShell Trader Pro itself does not export any source code, although you could get weights manually from the Neural Indicators addon if you wanted to.

On 2/21/2004 6:52:28 PM Rick A wrote:

Thanks for your reply to my question!

So to summarize, the weights can be obtained presently by purchasing more Ward Systems products. Would you consider extending the product I've already purchased (NST Pro) to export the weights?

E-Mail Alerts

Date :3/3/2004 10:28:45 AM Poster : Chris Goodwin

Is there a way to generate an e-mail alert from NDT 4? Often times I'm away from my desk, and I need an easy way to have a trade signal send an e-mail to my cellphone so that I can execute a trade.

Re: E-Mail Alerts

Date :3/3/2004 4:58:13 PM Poster : Ward.net Webmaster

There's nothing in NeuroShell in the current release to do that. You could program one if you were so inclined using the Data Exchange add-on. We are working on a broker interface for a future release.

On 3/3/2004 10:28:45 AM Chris Goodwin wrote:

I'd be interested in the email interface also. It would also be useful if the email could include or attach a "report". The report would be the export/print of the name of the chart, ticker, graph, alert text, etc.

Steve Wards Trading Method

Date :3/11/2004 4:29:35 AM Poster : Robert J Van Eyden

Hi,

After many years, I'm trying to get back in swing of things and I appreciate articles such as Steve's on his trading method. I do have one question, which is probably as vital as the inputs in designing a net, what is the output he is trying to predict? All I could gather from the article is that he is trying to predict the overnight gap of the S&P eminis, do I understand correctly that he is predicting the change of the previous days close and today's open or have I totally lost the plot. Any insights will be appreciated.

Regards Robert

Re: Steve Wards Trading Method

Date :3/11/2004 10:29:22 AM Poster : Steve Ward

I suppose I should clarify that in some detail. The Neural Indicators are not trained in the usual way neural nets are trained. That is, they don't have actual outputs to learn from. They aren't taught to predict the percent change in price, or any future value of any kind. Since the internal weights of these nets, embedded as they are in indicators, are modified by the genetic algorithm optimizer, they can simply be taught to produce signals that make money without training on some actual output. (That's one reason I like them so much, and as far as I know, we were the first to ever use this technique).

So they aren't trained with any output, but they do produce an output - a signal from -1 to 1. The higher the signal the higher the probability that you should buy (if the indicator is used as a buy condition) or sell (if used as a sell condition).

When I said in that tip that I sometimes predict the overnight gap, I was referring to how I set up the entry and exit times. To predict the overnight gap, you make sure entry occurs around 4PM EST, and exit occurs first thing the next morning. You do this by putting time flags in as entry and conditions as follows:

Buy long when all of the following are true:

The long entry neural indicator is > x
The time is = 3:55 PM

Sell long when all of the following are true:

Time = 9:35 am

Sell short when all of the following are true:

The short entry neural indicator is > x
The time is = 3:55 PM

Cover short when all of the following are true:

Time = 9:35 am

What the strategy above does is make a decision every day at 3:55 whether to go long, or short, or do nothing. Using the times in this manner allows the neural net to narrow the amount it has to learn. It only has to learn to make decisions about one time of the day, not all day long. Instead of predicting the overnight gap, you could just as easily make a model to predit between 10 and 10:30, or between 12 and 1, etc. You can have several models that specialize on different parts of the day.

No, it is not a mistake above that both long and short entries use A>B. Neural indicators are very symmetric, and they will train to produce appropriate signals whether you use A>B or A<B in long or short conditions. So once I insert A>B as a long condition, I can insert the same rule again as a short condition or as exit conditions without having to retype it all in again.

I think Neural Indicators combined with specific time frames are such an advance in trading that it is worth it to me that everybody understand them. So I invite more questions on this thread on the subject.

Re: Steve Wards Trading Method

Date :3/13/2004 7:02:02 AM Poster : Steve Ward

That's a really good question. Probably just habit, but maybe in the back of my mind I wonder if they might work a little better if that threshold (the B in the hidden A>B) is allowed to vary too, in spite of the extra free variable. Anyway, I have no solid reason why I do not use the conditonal versions.

Add-ons

Date :3/11/2004 10:44:38 AM Poster : Steve Ward

Since my advanced AI College course does not cover add-ons, and since so many of you who own them do not fully understand their use, I now invite questions about our add-ons on this forum. The following add-ons were either programmed or designed by me because I wanted advanced techniques for my own trading: Adaptive Net Indicators (ANI), Adaptive Turboprop2 (AT2), Neural Indicators (NI), Cluster Indicators (CI), Turning Points (TP), and the Fuzzy Pattern Recognizer (Fuzzy). They are advanced concepts, and so you should not be shy about asking about them. To begin the discussion, I want to point out that many users of addons do not know that each add-on has its own help file, and that all except Advanced Indicator Sets 1 (AIS1) and 2 (AIS2) have examples. The help files describe how to view the examples.

Re: Add-ons

Date :3/11/2004 4:17:00 PM Poster : Maciej

Steve,
Concerning the TP Addon: Is it possible to create an indicator that says Close > line joining TP 4 and 2? I can get a support / resistance line from the TP Addon for Turning Point no 2 but can I slant it according to the previous support / resistance line?

On 3/11/2004 10:44:38 AM Steve Ward wrote:

Re: Add-ons

Date :3/11/2004 4:51:29 PM Poster : Steve Ward

Well maybe. First I assume by TP4 you mean the 4th turning point back. There's an old tip called Trendlines that tells how to calculate lines between two price points. You know the x values using the TPBars indicator. You know the Y values using the support and resistance level indicators. See if you can combine all those things to get at least close to what you want. I haven't tried it, but it sounds feasible.

Re: Add-ons

Date :3/16/2004 2:29:13 PM Poster : Bill Van Dyke

Hello,

I'd appreciate maybe an example of how the Adaptive Turboprop2 (AT2) can be used as an Indicator inside a Neural Net Prediction. I understand how AT2 can be used in a Trading Strategy and both examples that come with it show this.

But i'm a bit fuzzy as to how to include AT2 as an Input to a Neural Net prediction and how to be sure AT2 is not engaging in any forward leak or something else it shouldn't do, in such a case, for example. Thanks a lot.

Bill

Re: Add-ons

Date :3/18/2004 8:15:16 AM Poster : Steve Ward

In spite of the fact that we mentioned feeding AT2 indicators into the Prediction Wizard in the help file, it does seem a little like overkill to me. I supposed you could call such use a supervisory net evaluating a panel of other nets. Nevertheless, the only reason I would ever use AT2 nets in the PW is so that I could have one net for all entries and exits as explained in the tip on this site called "Speeding up the add-ons". AT2 was really built to replace the Prediction Wizard in the sense that nets could be optimized with other indicators in the Trading Strategy Wizard, and so that training parameters and output indicators could be optimized at the same time.

Hi Bill & Steve,

I think it totally depends on what you try to achieve in the PW...

Oftentimes I find myself using the addons to "polish" my inputs further before feeding them into the final neural net used for trading...though I think it pays off to seriously limit parameter ranges...unless you have a Cray working on it :-))

Best & nice weekend,

Bertrand

Re: Add-ons

Date :3/19/2004 11:10:19 AM Poster : MFK

Steve:

In the tips and techniques article on your trading method, you say you let the NI add-on train from three to six hours. That time, you suggest, is needed to optimize the three to five indicators used, plus the up to 18 weights used in, say, a recurrent 5 NI. That prompts several questions:

1. Is there some rule of thumb you use to estimate how much time the net will require to adequately explore the parameter field? Or is it just one of the "hunches" you have based on your years working with Ward products?

2. If there is some rule of thumb, would it also apply to the other Ward add-ons, such as Adaptive Nets, Adaptive Turboprop 2, etc.?

3. With a three to six-hour training time, how often do you retrain your NI strategies? Not surprisingly, I've found that my NIs are strongly influenced by the patterns they're trained on, to the point that those trained on data from last year are having a difficult time in this year's strong up move. (I'm not getting bad signals; it's more of a matter of missing signals.)

4. Which leads to a final question: What are the chances that NI (and other) add-ons might include a "retrain" function similiar to that on Adaptive Turboprop 2?

Re: Add-ons

Date :3/19/2004 3:26:39 PM Poster : Steve Ward

I'll answer your questions by number:

1. The only rules of thumb I have are (a) NI take a long time, and (b) the recurrent types take much longer because they are building a "lookback". Beyond that it just depends on training set size, number of inputs, whether you have 2 NI in buy/sell rules or 4 because you included exits, how predictable your issue is, speed of your computer, and probably more. No science here.

2. If I had less fuzzy rules, they probably would not apply to the others, because NI are the slowest, being trained by the optimizer as they are.

3. I usually retrain/reoptimize once a week on the weekend.

4. The retrain option for NI isn't practical because it is really reoptimizing each time. Nobody would want the NI to start reoptimizing in the middle of a daytrading session! But note that ANI already have an automatic retrain every bar.

You just select one of the AT2 indicators as a Prediction Wizard input exactly the same way you select any other indicator as a Prediction Wizard input. Of course the AT2 indicators have parameters that need to be set, like any other indicator has parameters that need to be set. Since the AT2 indicators are themselves nets, their parameters include THEIR inputs.

Exits: both on open and MOC

Date :3/11/2004 6:24:16 PM Poster : Maciej

Has anyone tried to have two types of exit ie on open and MOC in a trading strategy? It would seem that the only way to have two different times to exit a trade in a trading strategy is to use a second strategy that uses the first strategy as input.

add-ons

Date :3/19/2004 2:37:25 PM Poster : Al Martin

As I own a number of your add-ons I am aware that I am not getting as much out of them as I could. For me it seems that there is not enough discussion about their use with enough examples to highlight the fine points. I have not seem a good discussion of the various parameters such as "neighborhood", "window" etc. Also, it would be good to discuss the interactions that can occur between add-ons. For example is a good idea to use Lag inputs in Adaptive Turboprop2 and also use recurrent inputs for neural indicators? Have you considered creating an add-on educational CD which could focus on in depth use of specific add-ons?
I know I would be willing to pay for that type of help.
From reading the notes in the forum, I can tell that Neuroshell users have many different skill levels. I am sure that for the more technically advanced additional explanations may not be necessary. But, I would think that you have a considerable number of users who would be interested in greater detail. I also suspect that greater detail contributes to greater sales.

Re: add-ons

Date :3/19/2004 3:43:30 PM Poster : Steve Ward

Well that's exactly why I started these threads - to promote more discussion and education about the addons. There are so many ways the add-ons could interact and be used I could not possibly think of them and document them all in advance in an educational CD, even if I knew answers to questions such as yours below. But frankly I find most users don't even assimilate the infomation in the respective help files, which is another reason I'm willing to help here - I know the add-on technologies are complicated.

Your specific questions have to be answered "Try and see." There are no absolutes in using many of the multitude of tools we provide, and often it depends on what you are predicting, what your inputs are, what the market is like recently, etc. The lag versions of ANI and the recurrent NI were built, however, so that history could play a bigger role in each decision. On the other hand, many inputs and indicators already lookback.

In a previous note I meant to identify Adaptive Net Indicators and not Adaptive TurboProp2. I was concerned about the interaction with a great number of recurrent inputs.

eSignal 7.6
Date :3/24/2004 10:37:56 AM Poster : Bertrand Wibbing

Hi,

for all eSignal users this may be of interest: after also having some realtime problems as soon as 7.6 came out, I now found out that the newest built seems to work smoothly again in connection with the Trader...no issues with live & historical ticks so far...

Good trading to all :-)

Bertrand

> As far as we can tell right now, any 7.6 fails with NeuroShell for most people just starting out with eSignal. If you had 7.5 installed before, most people have no problems, but there have been some like Bertrand who had 7.5 and 7.6 failed. If you switch to 7.6 be ready to go back to 7.5 until we get this worked out with eSignal. If you want to start out new with eSignal, take a look at the article on this site called "Run Time 339 When Using eSignal" under Bugs, Fixes, and Warnings. It has a link where you can download 7.5.

A good FOREX broker?
Date :3/26/2004 3:08:07 PM Poster : Matt Jarvis

I'm thinking of trying my hand at Forex, so I am wondering if anyone can recommend a good interactive broker for someone who will probably only trading one lot at a time. I've heard there are no commissions but I still seem to find differences in fees in the ones I've looked at. I suspect that some are cheaper than others if you are trading small potatoes?

Re: A good FOREX broker?
Date :6/7/2004 4:50:00 PM Poster : Maciej

You may be interested by what my futures broker apparently can offer in FX (I don't trade FX):

"We Now Offer 3-Pip Spreads on EUR/USD! As you might imagine, EUR/USD is the most actively traded currency pair and accounts for over 60% of all forex trading volume at XPRESSTRADE. As a result of this volume, we can command the best possible pricing, which we are passing along to you. Starting Sunday, June 6, we will be lowering the spread on the EUR/USD pair by 1 pip (from 4 to 3).

It's important to point out, once again, that many forex brokers claim to offer 3-pip spreads, yet they execute your order only if they believe it's in the wrong direction. At XPRESSTRADE, all of the bids and offers displayed on our FX Trading Station are executable, which is to say that these are prices at which you can actually buy or sell. Just click the bid or offer, and we guarantee that the trade is yours at that price, without slippage or partial fills. XPRESSTRADE now offers 3-pip EUR/USD spreads and superior execution, a combination that's not matched by our competition."

and:

"Reduced Forex Margins Beginning June 6th: New National Futures Association regulations allow Futures Commission Merchants who maintain twice the normally required net capital to offer reduced FX margins. XPRESSTRADE is in such a position, happily, so effective June 6, we are reducing our forex margin requirements to pre-2004 levels. Our standard margin will be 1%, which means $1,000 per lot for all full-size currency pairs and $100 for all Mini FX currency pairs. But we will continue to give you the ability to choose the degree of leverage that works best for you. Accounts with equity less than $50,000 may trade with just 0.5% margin -- in other words, just $500 allows you to control a $100,000 spot currency position, and you can trade Mini FX with only $50. And as always, if you'd like the opportunity to earn interest, the margin requirements will be $2,000 for standard FX and $200 on the Mini Account."

Hope that helps.

Tradestation securities offers the 3-pip spread also, but I do not know if they fail to execute your trades if they think you will win! Then again, notice that they say they will execute the prices SHOWN on Xpresstrade's platform..... maybe they are delayed a few seconds, or they drift away from the true interbank quotes a pip here and there....when their Neuroshell Trader system says to adjust the quotes up or down a pip. Really, according to my limited reading, the true interbank spreads are 2 or even 1 pip on EUR/USD, as well as the Japanese Yen versus USD. That means the bid and ask that you SEE are proprietary to Xpresstrade or Tradestation Securities, or whoever your broker...

Also, it is my opinion that a broker who offers outrageous leverage thinks it is dealing with suckers. Again, according to my limited study, the optimum leverage which experienced FOREX traders consider useful while properly managing risk is less than 100 to 1. With higher leverage, you should be placing a smaller percentage of your available capital in each trade, and be collecting interest on the available purchasing power of your margin account. Also, you should collect interest proportional to the differential in the two currency interest rates, if the broker is really offering good service. I know Tradestation does not offer interest. Don't know about Xpresstrade. I also have seen warnings on the internet against signing up with offshore FOREX brokers. You have been warned. I got a letter from a government worker in Nigeria who needs a volunteer to give them access to a bank account.....

That said, I am still looking forward to automated trading in FOREX someday, but I don't think all the needed elements are easy to find yet, particularly ones that have an honest aura about them.

Steve, the only way to prove matters is to trade and see how it works out in practice. I use Xpresstrade for futures and their prices and the prices I get compare favourably to my data feed prices from Quote.com or lately ESignal and when things don't work out the rules/explanations are clearcut. These brokers need to make money so I doubt if you ever will get true Interbank rates but then you are unlikely to be dealing on the same scale. I could get great rates going with a bank on certain currencies but at a $million as the minimum size and that's not for me. At the end of the day your broker wants you to make money as that's the best way for the broker to make money better than churning accounts.
As for Nigerians - they are the king of scams in the UK.

McAfee Virus Scan & NST

Date :3/27/2004 5:54:57 AM Poster : Bill Van Dyke

Hello,

I'm using McAfee Virus Scan. After the latest update to it yesterday on 3/26/04....later when i tried to open NST, i get a message that there is a "suspicious script" in the NSTrader.exe file.

I've scanned the Computer for Viruses, trojans, etc. and it finds none.

I'm just wondering if the latest McAfee update interprets something as a "suspicious script" when trying to start NST, and if any other users have experienced this. As i said, the latest McAfee dat file was created on 3/26/04. Much thanks for any feedback.

Bill

Re: McAfee Virus Scan & NST

Date :3/28/2004 8:05:25 AM Poster : Maxwell Craven

I don't have McAfee but Norton AV doesn't have any problem with NST, and I'm up to date on that.

Russ & Maxwell,

Thank you both for your comments. I sent Steve a Pic of the Message that comes up most of the time when opening NST, and it's a normal script that NST excecutes that the latest .dat file update of McAfee apparently at times interprets as a Suspicious Script and gives one the option of stopping or continuing.

DLLs for Ehlers latest book

Date :3/27/2004 5:02:15 PM Poster : John Gotwals

John Ehlers' Cybernetic Analysis for Stocks and Futures is now shipping and both the book jacket and the "For More Information" section of the book state that DLLs and templates for NeuroShell Trader are available from Ward Systems. I checked the website a bit and couldn't find any reference to these items. Have I missed something?

Re: DLLs for Ehlers latest book

Date :3/28/2004 8:03:08 AM Poster : Ward.net Webmaster

Yes, we are making a Cybernetic add-on using John's work, but it will be another week or two before we have it ready. The book came out a little before we expected it. But go ahead and read the book, because that is the documentation for the theory behind the indicators that we will be providing in the add-on.

Tick or Volume Bars any time soon for Daytrader?

Date :4/1/2004 3:21:14 PM Poster : Jim U

What are the plans if any to support tick or volume bars, as can be created in eSignal or Tradestation, for the Daytrader? For instance, I'd love to be able to run Neuroshell on 55-tick bars. Support for this gets my vote for top next update.

Re: Tick or Volume Bars any time soon for Daytrader?

Date :4/2/2004 1:47:42 AM Poster : Bertrand Wibbing

Hey Jim,

jep, you've also got my definitive vote for this! :-)

Would be much better for some nets to run on tickdata as one can verify using TradeStation...less "spikes" & more continuous movement...

But as far as I understood this feature is alreday on the "To-Do List" as many may have requested it.

Personlly I'd love to see constant range bars...

Best & have a nice weekend!
Bertrand

DDE for IQ-Feed

Date :4/2/2004 10:55:51 AM Poster : Bertrand

Hi,

is anyone out there successfully feeding the Daytrader Pro with the IQ Feed? If one needs just Eurex & CME/Eminis this seems to be a very competitive priced alternative to eSignal...I am also considering switching because of recent security problems...

Since IQ would feed the Daytrader through DDE: has anyone programmed an interface? If yes I would be highly interested in a comment on ways to obtain it!

Thanks & good weekend to all,

Bertrand

Re: DDE for IQ-Feed

Date :4/2/2004 11:17:46 AM Poster : Steve Ward

There has actually been an ongoing project between WSG and DTN to implement a direct interface to their real time data (IQ Feed I believe) in NeuroShell DayTrader. However, it has been ongoing very slowly. It could help speed that project up if any NeuroShell user interested in switching to DTN would email the DTN sales department and tell them how interested you would be in an interface!

Re: DDE for IQ-Feed

Date :4/4/2004 7:14:57 AM Poster : Bertrand

Hi Steve,

great to hear WSG & DTN are already working on a direct implementation of the IQ Feed into the Trader...

I also encourage anyone interested in switching mailing the Sales dept. of DTN/IQ, because this would make IQ an ideal backup feed for many applications.

Good weekend,
Bertrand

Optimizing trading stradegy parameters equally

Date :4/13/2004 11:54:22 PM Poster : Alan Rhodes

When I use the trading stradegy wizard to optimize parameters, I get different parameters for long entry, long exit, short entry (buy to cover), and short exit. This tends to favor a distinct trend.

I want to be able to optimize each rule so that they have the same parameters. In other words the long entry short exit are the same, and long exit and short entry are teh same. I cannot figure out what to even type into the help files to look up how to do this. I assume it is something like mapping parameters while building indicators, but I cannot even find information on that even mapping paramters for indicators.

Re: Optimizing trading stradegy parameters equally

Date :4/14/2004 10:19:55 AM Poster : Ward.net Webmaster

It is called Optimization Parameter Linking. The best way to see how to use it is to just click on the plus sign to the left of your rule, which is where you see the parameter ranges. Then double click on a parameter range to put you into the dialog box that allows you to set the parameter range. There you will see the ability to associate different parameters to named links. You create a link for one parameter, and then when you set ranges for the other parameters, just associate them to the link you created. All such associated parameters will optimize to the same value.

On 4/13/2004 11:54:22 PM Alan Rhodes wrote:

Re: Optimizing trading stradegy parameters equally

Date :4/14/2004 5:49:28 PM Poster : Maciej

I've also taken this idea a little further by adding a relational expression such as A>B where A and B are linked parameters used elsewhere to ensure that for instance my short term MA is really shorter than my long term MA when using MA crossover strategies. This constrains the optimizer and hopefully reduces the time taken.
What would be useful is to have some way of forcing the optimiser to provide integer solutions after all a MAverage of 5.5788 is not really practical. Can anyone help?

On 4/14/2004 10:19:55 AM Ward.net Webmaster wrote:

We tried it too and observed the same thing Xprogrammer did, and Xprogrammer is correct that NeuroShell knows whether parameters are integer or not. We weren't able to make it do anything but integers. How did you make it non-integer, Maciej?

Apologies to all - I retried and you are correct the MA values are integer. The idea of controlling the number of decimal points or increments can be useful. I deal in soybeans and the price increment is 0.25 of a point ie 1010.75 is valid 1010.63 is impossible. When using the trailing points protective stop there is no way that I can see of forcing the points to use such increments - or is there? Obviously no show stopper.

It is called Optimization Parameter Linking. The best way to see how to use it is to just click on the plus sign to the left of your rule, which is where you see the parameter ranges. Then double click on a parameter range to put you into the dialog box that allows you to set the parameter range. There you will see the ability to associate different parameters to named links. You create a link for one parameter, and then when you set ranges for the other parameters, just associate them to the link you created. All such associated parameters will optimize to the same value.

On 4/13/2004 11:54:22 PM Alan Rhodes wrote:
When I use the trading stradegy wizard to optimize parameters, I get different parameters for long entry, long exit, short entry (buy to cover), and short exit. This tends to favor a distinct trend.

I want to be able to optimize each rule so that they have the same parameters. In other words the long entry short exit are the same, and long exit and short entry are teh same. I cannot figure out what to even type into the help files to look up how to do this. I assume it is something like mapping parameters while building indicators, but I cannot even find information on that even mapping paramters for indicators.

Thanks for fuzzy
Date :4/16/2004 2:05:18 PM Poster : Matt Jarvis
I just want to say thank you to the Ward Group for building the new fuzzy plugin. I have really found it to be useful in my trading. It is strange but I have not even been using all the indicators because the fuzzyrange one gave such good trades I never went on to the others!

Re: Thanks for fuzzy

Hi Maciej. It make a lot of sense to be able to partition the values of an indicator instead of testing for above or below some value. I have now built some fairly complicated indicators that respond much better with fuzzy partitions than they did before. It also helped with one of the ones Steve Ward recommends - the slope indicator.

MB Trading
Date :4/21/2004 3:32:06 PM Poster : Maxwell Craven
Does anyone know anything about an online broker named MB Trading? They look pretty good on their website, but has anybody had any actual experience with them?

predictions
Date :4/22/2004 3:38:28 PM Poster : Alan Rhodes
On the prediction wizard, there is an option to set the number of days into the future to predict. Is there a way to see this, or even better see it with confidence bands around it? Or best, get those number and use them?

Re: predictions
Date :4/23/2004 3:06:29 PM Poster : Ward.net Webmaster
For the first part of your question, go to the Tools menu, select Options, then the Predictions tab. Press the Help button there for details. Since we are asked that question a lot, we have also just described it in a different way on this site under the topic "Changes in Documentation" in an item called "Predictions vs Prediction signals".

The second part of your question is best answered in the tip on this site called "Confidence factors in predictions."

On 4/22/2004 3:38:28 PM Alan Rhodes wrote:

Can DLL access date-time of bar?
Date :4/27/2004 1:12:35 PM Poster : John Gotwals
I am writing a DLL that will calculate and write to a CSV file the maximum adverse movement of each trade. This file will then be loaded into an Excel worksheet for analysis.

For each record of the file I would like to write date and time fields, but it appears that I cannot access the year. There are month of year, day of month, and time of day indicators, but no way to find out the year. What I would really like is one time series that contained the combined date and time, and my DLL would parse it into date and time.

Any comments or suggestions?

Re: Can DLL access date-time of bar?
Date :4/27/2004 4:43:59 PM Poster : Xprogrammer
Try using the bar's date. It's in the SDK but I explained it more last sept with somebody in a thread called Internal format of date passed to DLLs.

Building Trading Systems Ideas
Date :5/2/2004 9:53:10 AM Poster : Alan Rhodes
I have been running into two walls when building trading systems.
1) I would like to be able to factor one indicator into another. For example, I tried using Ehler's DLL this weekend. I would like to try to calculate the alpha for many of his indicators using a factor of the inverse of the Cyber12_AdaptiveMomentum indicator. All I can set for a parameter is a number.
2) I would like to be able to create a "break out rule." For example, I would like to be able to say "If I exited a long position due to a stop loss, go long again if the market passes the highest high of the previous long."

Any ideas? Thank you.

Re: Building Trading Systems Ideas
Date :5/3/2004 4:06:38 PM Poster : chris wong
ward system would have had to program the dll so that it takes either a parameter or a stream. if they had done that you could do what you want, but the down side as i see it is if you use a stream you couldn't optimize the parameter. for your breakout i'd look at comparing exit price indicator to the stop price. for the highest high of the previous long you could probably take value when exit filled (max value since entry filled) or similar. it could get pretty sticky unless you started using some code to do these things.

Thank you for your thoughts. I was not aware of the exit price indicator, and that gives me a lead on what to study. I am not exactly sure what a stream is, but my trading partner does program neural networks, and I will ask him what that is after he buys NeuroShell, which will be soon.

Again thanks.

optimization targets
Date :5/3/2004 12:36:09 PM Poster : cabruner
First, let me say thank you to Steve Ward for posting much detail about his own trading methods to the ward.net website. I find distilled insight to his own experience very useful and I'm guessing many others do too.

Regarding optimization targets, I've tried many times to move away from Return on Account to a target which incorporates risk as well return, such as Sharpe Ratio, Ratio Gross Profit / Gross Loss, Max Avg Trade Profit etc..

Unfortunately, I never find them useful because they almost always optimize to something with very few trades. A simple example: If you select Max Avg Trade Profit, one trade worth 10% will always trump 40 trades worth 1% each. Clearly I can't depend on the first scenario to perform well out of sample, but the 2nd is a great result. This happens with the great majority of optimization targets provided, which seems directly contrary to intentions for including these.

I think a simple solution to my problem would be the ability to specify a MINIMUM number of trades (or trades per week, month, etc..), so that I can be sure the statistics are generated from a meaningful sample. I think this could go a long way to defending against over-optimisation and building systems which perform robustly out-of-sample.

It would also be nice to be able to specify a maximum number of trades, but I agree it can be done approximately by raising transaction costs. Unfortunately, I don't know of a way to jog Trader into raising the number of trades it selects for..

Any thoughts/advice much appreciated,

cabruner

Re: optimization targets

Date :5/8/2004 12:20:15 PM Poster : Chris Bruner

Hi Chris

Thanks for the suggestions. I've tried those before and agree they can be somewhat useful to help with this problem.

That being said, I think a minimum trades specification would be very useful in addressing the issue, and would unlock the ability to use all the other optimization targets in their intended manner.

Generally, I think improvements to defining optimization targets, as well as filtering criteria for what are acceptable trading results, are the most important areas for improving Neuroshell Trader.

The benefits are many:

1 - Greater ease to apply practical market knowlegde to the problem and let the optimizer help you disqualify non-practical solutions.

2 - Resultantly, less fear of over-optimization.

3 - Scaling to optimize for similar results across securities of different volatilities, which can only be done using risk-adjusted metrics. This is especially important if you trade securities using leverage.

Over-optimization to me is simply not having a well-defined optimization target. If you have a better target, you should always be happy to fully optimize.

Just my two cents. Is there somewhere I can log feature requests more formally? I also wanted to ask if walk-forward testing will be available in Trading Strategies at some point in the future.

Best regards

Chris

Re: optimization targets

Date :5/11/2004 8:19:17 AM Poster : Ward.net Webmaster

We agree with most of what you said, and all the features you requested are already on our projects list. However, here's one part we don't agree with:

>Over-optimization to me is simply not having a well-defined optimization target. If you have a better target, you should always be happy to fully optimize.

We think you can over optimize any target given enough free variables or too few bars that you are optimizing over. It isn't the better target that's needed - it is more relevant inputs (if using a net) or rules (if using a trading strategy). If you have the right input variables, that is when you are happy to fully optimize. Unfortunately, even that isn't true when the data has noise, because then you are always in danger of fitting the noise.

Nonetheless, the ability to let users build their own target is something we want to do.

Some time ago I suggested that a good way to modify the fitness of optimizations would be to add the ability to penalize trades, as by slippage or commission, in the trading costs parameter dialog, using an "indicator" of your own choosing (right from the builtin or custom indicator wizard). For example, you could cause too few trades per month to add a penalty, or more trades to add a bonus, and you could shape this constraint at your pleasure. The advantage to this would be that Steve Ward would not have to alter the logic of the built-in fitness criteria.

Anybody else like this approach???

Steve

Video Tutorial Playback

Date :5/14/2004 7:25:42 PM Poster : Steve Eberbach

I just received new ver. 4.4 CD of NST and tried to view videos for new version.

I got a screen full of notices: "I had to update" Real Player, and once I did so with lots of advert-hassle, the >avi files could not be played back. I heard audio, but no video.
I tried again, and got a new dialog, saying that an update needed to be downloaded. I clicked the "yes", filled out the new registration forms (yecch). An update downloaded: version 10 Basic. Trying again the Tutorial CD, Again I was told an "additional" update was needed. I clicked "yes", and was told additional needed "update was not available". Now I do not even get to hear the audio of the tutorials anymore!!!

Anybody else have this problem??? What to do now???

Maybe some other application can play back so-called "*.avi" files!??! (does win XP no longer play these????)

This kind of hassle is not cool. Maybe I need some more written docs...erm....

Otherwise I need to install all of NST on my other computers, in the hope that one of them will play my CD!

The reason, according to Real, is they cannot play "ICM.tscc", whatever that is.

Re: Video Tutorial Playback

Date :5/15/2004 8:00:10 AM Poster : Ward.net Webmaster

You need to contact tech support on Monday. The new 4.4 videos have their own player installed and integrated, and you don't need the Real player or Windows Media Player. We got tired of those kinds of hassles too, which is why we went to an integrated player. There could be some kind of real hard link to Real Player in your OS that needs to be investigated (most of us HATE Real Player and would never make people use it.). In the mean time, make sure you aren't trying to play the 3.8 videos on the 4.4 system, or the 4.4 videos on the 3.8 system. Hopefully you uninstalled 3.8 before you installed 4.4. If you install correctly on another computer, most likely the videos will work fine, because we don't remember your problem being reported before.

Re: Video Tutorial Playback

Date :5/15/2004 11:39:02 PM Poster : Steve Eberbach

To Follow up on this:

I opened the NST ver. 4.4 CD in my other computers and tried the executable versions of the videos. They run just fine straight off the CD with a mouse click even without the Trader 4.4 installed. I did install 4.4 NST properly (without installing videos) on a newer XT machine, but somehow RealPlayer grabbed rights to the .avi extension, and my only problem was linking to the video through the Trader menu, which did not seem try to run the .exe version off the CD. Maybe since the (original) 4.4 version installation was from a download, not the CD, the Trader did not know the right location for the videos. Media player on another machine also had no problem with the .avi versions running straight off the CD. Also, making my case unusual, I uninstalled the 4.x beta before installing 4.4, which had been updated in stages from ver 3.7.

Upgrade to 4.5

Date :5/16/2004 8:25:44 AM Poster : Sunny

I just finished upgrading to version 4.5.

However, I am getting very different results than from the previous version installed. I had just finished retraining my charts on Saturday with the older version, and today, Sunday, I installed version 4.5.

The difference in results is extremely significant.
I removed version 4.5, and again I installed the previous version, and I get my old results again.

Is there anyone else having this being an issue?

(Please note that on the weekend there is no new incoming data so the results should be the same with either version).

Exporting Intraday NST-Indicators to TS2000i using DataX

Date :5/16/2004 3:03:39 PM Poster : denizen

Has anyone used the DataX add-on to export indicators to TS2000i for multiple timeframes, including intraday bar intervals (as well as daily bars)? I have the DataX add-on. I also am capable of creating a Delphi-programmed-DLL that would be called by a function within TS2000i, and then provide the calls to a 'DataX-server' to fetch the updated array from the NST. But I would prefer to purchase a solution already developed, if it exists. I am willing to pay something reasonable for such a working example, or 'product'. Anybody have any info that would lead me to some kind of quick 'solution'?

look foward window in predictor

Date :5/21/2004 10:11:16 AM Poster : Brad

Can anyone tell me what is an appropriate look foward window to use as it is not able to be optomized and as I change it, my evaluation window shifts.

should it be a length that encompasses a bull move?
one that encompasses a bull and bear move?
should it encompass many?
is too long worse than too short?

For those with experience and wisdom in this area, help me please?

Re: look foward window in predictor

Date :5/21/2004 6:03:58 PM Poster : Maciej

Brad,
It's simply a facility to allow you to evaluate an optimized system on "real" data. As to length I think its largely trial and error - not very helpful I know. I've tried various lengths and most times I use a look forward that equates to the time I'm likely to be trading the optimized system and / or when I see from the analysis of the performance of the forward window that the effectiveness is falling off meaning for me a re-optimization is necessary. That way I'll have a fairly good idea how long I can use the system in real life. Some expect to re-optimize every day others much longer but in any event I don't expect to use the criteria such as a bull or bear trend being encompassed. To me that's irrelevant. For example if I'm optimizing in corn currently I'd be hard put to find much down trend and from a short term point of view I'm only interested in following the current bull trend and if my system works in that scenario that' fine. I'll be reoptimnizing in a week / 15 days anyhow to ensure that I have the lastest pulse of the market.

On 5/21/2004 10:11:16 AM Brad wrote:
Can anyone tell me what is an appropriate look foward window to use as it is not able to be optomized and as I change it, my evaluation window shifts.

should it be a length that encompasses a bull move?
one that encompasses a bull and bear move?
should it encompass many?
is too long worse than too short?

For those with experience and wisdom in this area, help me please?

Re: look foward window in predictor

thanks for the advice

Re: look foward window in predictor

Date :5/23/2004 9:58:09 AM Poster : Maxwell Craven

Just FYI, it is possible to optimize the look forward on the AT2 an ANI neural net plugins that Neurosell sells. They are parameters as are training set size and retrain interval, even hidden neurons in AT2. For the wizard I prefer shorter lookaheads.

not quite sure how it can optimize the window when with the trader professional, changing the window creates a differenet training and evaluation period. It is not possible to compare the same time periods when changing the lookfoward window unless you manually change the data dates by hand each run.

thanks for the information though, I will have to see how it works.

Re: look foward window in predictor

Date :5/25/2004 9:15:14 AM Poster : Ward.net Webmaster

Maxwell is correct. You can let the optimizer vary the lookforward window, and still hold the training set size fixed if you want to. The evaluation period is the backtest period so you should be able to compare correctly. Those addons do not use walk forwards because they automatically retrain as frequently as every bar, so you can't think of them the same way you think of the Prediction Wizard.

EasyLanguage translation

Date :5/21/2004 10:04:36 PM Poster : John Jensen

While reading a book that uses TradeStation EasyLanguage I came across the trading condition: ExitLong at Lowest(Low,StopLen)Stop. I have been able to translate most other EasyLanguage conditions into NST but not this one. Will someone familiar with TradeStation please give me the english translation for it? Thanks.

Re: EasyLanguage translation

Date :6/28/2004 12:49:51 AM Poster : Michael Begley

I have asked Ward Systems technical support to forward you a document which should help you in this endeavor.

Thank you Mr. Begley for your contribution. Unfortunately, we will not be able to post this document on our site, nor pass it to Mr. Jensen, as it is copyrighted material from Omega Research. However, we have looked up the Lowest function for him - see our other post on this topic.

Mike Begley

We aren't TS experts, but here's what we think it is: you exit the long position on a stop price equal to the lowest value of the Low over the last StopLen bars. You should be able to use our indicator PriceLow to substitute for their Lowest. We read the definition of Lowest in our TS help file, and that is what it does.

Bizarro!

Date :6/1/2004 12:23:12 PM Poster : Steve Eberbach

I read with considerable enjoyment Steve Ward's recent tip for contrarian trading of neural network models.

I contacted Steve and received his blessing for trying to start some dialogue on the forum on the subject. I am very interested in finding out what other people think about this subject, as the phenomenon is well known, but all people seem to do is joke about it.

Here is one example of what I found.

Rather than reverse the trading strategy, I used a "target", which the neural network tries to fit using a least-square fit, which is inverted, typically an average or momentum of the next few days' prices. I use the genetic algorithm to try to optimize total profit, in contradiction to the effort of the neural network target fitting. (I am oversimplifying a bit here, for the sake of not writing a book in this posting)

Next, I did many walk-forwards of this process, and overlaid the equity curves of the span of time out of sample. The look-forward was typically 6 months using end-of-day data. The resulting average shows that there is a "signature" pattern, which I call "the hook", in which equity immediately rises for a characteristic period, then drops.
This is the same as saying that if the usual kind of walkforwards are overlaid, the equity will show a tendency to drop immadiately out of sample, then later recover. So I know the bizarro phenomenon is real, and pervasive.
Of course, automating this is somewhat difficult, so it may seem to be a lot of work for a trick that does not always yield a big payback. But I do find it tradable, and take it seriously.

This is the main reason, in fact, why I have posted and begged for some kind of user-defined fitness, or at least a penalty factor, either in the fitness choosing dialog, or in the transaction cost dialog, said factor being an indicator built wth the Indicator Wizard.

My basis for this is that I consider the whole "Bizarro" thing to be a special case of user modification of the Fitness definition which happens to offer serious profit potential. (minimum profit in training, maximum profit in optimizing just beyond the training period)

Beyond this very important, but very limited discovery lies a bigger world of successful trades which I believe is denied to us by the restriction of not being able to define what we are trying to get the Artificial Intelligence to do. So far, all the neural net tries to do is reach the holy grail: a FOREVER upward sloping equity curve, when we all know this is quite difficult. We also all know that known successful models are likely to be traded against, hence the phenomenon of "worn out models". No stock goes up in a straight line, so why should an equity curve? The REAL goal is that the equity curve will be more tradable than the underlying security which generated it. I will make good use of an upward sloping equity curve with a higher probability of going up for a while. Then when it fails, knowing it is likely to go down for a while!!!!

Anybody else out there have any experience or ideas about this????

i'm not following your last paragraph, probably because i don't agree with the premise that the objective functions force equity to go up forever. they aren't time related - they measure a summation of some measure of profit, so the equity curve could look like a hill, couldn't it, up one side and down the other? anyway, what objective function would you use if ns allowed definitions, which i do think would be a nice addition.

> OK Chris, here we go: Thanks for the response!!!
>
> Yes, the equity curve usually DOES look like a hill, if you rise in profit first, after some time, the hill returns, or retraces some or more than all its rise. Often, the equity curve also looks like a valley; it drops immediately out of sample, then later recovers. Other times, it simply goes flat. What is interesting, is that it often shows these shapes, and enough so that they are recognizable by inspection. The more effort you expend modelling a process to produce a long time rising equity curve, by telling the algorithm to maximize long term summation of profit without adaptation of that model to changing conditions (entering from beyond the model's experience space), (and rejecting an up and down shaped equity curve) during the TRAINING and TESTING phases, the quicker the equity retracement out of sample, in most cases. That is what Steve Ward calls "Bizarro!". So the time spans you choose for the training, testing, and out of sample look forward become confusing factors in determining the REAL fitness of your model. One would think that simply keeping the lookahead very short, and updating often, would give the most reliable profit, since intuitively one would think the model is more adaptive this way, but since there is an effect that immediate time span out of sample can have a LOWER slope of equity versus time (than farther out in time), that strategy can be self defeating. My theory is that the effect itself is caused by traders using optimizers! (either computed or human experience)
>
> So I am trying to find a fitness which is dynamic, and takes this phenomenon into account. So far, I have found that IF the desired equity curve IS a hill or a valley, and IF the length is chosen well, the downside can be a more reliable trade than the upside. I also consider the longest-rising equity curve a special case from many possibilities, and the one which most present-day optimizers compete with each other to achieve.
>
> This is contrary to the idea that fitness of a model should only be the final summation of gain over time. To research this further, I would like to see the ability to create dynamic fitness-modification functions, with the indicator wizard, depending on how far along in history "time-zero" is in training, into testing, or into "out of sample", and how well the trading strategy itself is doing at t=0 plus or minus some short duration.

Bizarro - another idea/question

Date :6/3/2004 11:11:37 PM Poster : Kermit

My idea about bizarro is that it is similar to Soros' reflexivity. I have always called it knowledge of the fundamentals changes the fundamentals. Most of my modeling is using fundamental data, and there is, IMHO, an example of this in the cattle market right now. Fundamentals look great, and the consensus amoung people who study the fundamentals is that there is nothing on the horizon to break this market. All winter producers have been told that the May/June time should see the biggest numbers and lowest prices. So now we are in the middle of it, and prices have been going straight up (no surprise). So, have enough producers modified their feeding programs to avoid selling finished cattle at this time and will there then be more than expected in the coming weeks? This is why I call this behavior "knowledge of the fundamentals changing the fundamentals." Is this what the bizarro method is trying to model? Trying to model other models behavior and take the contrary position? I would be very interested to hear if this is successful - I suspect that consistency would be a problem, just from personal experience.

Disappearing signals

Date :6/9/2004 4:20:52 PM Poster : Sunny

I have noticed that at times I will have a buy or sell signal at a certain point in time; however, if the market moves in the opposite direction of the signal, then the signal will dissapear from the original position, and it will appear at a prior location.

Has anyone else had this sort of issue with signals?

Regards,

Sunny

There was a very obscure problem in release 4.4 and below where a datastream could somehow become daily on an intraday chart, and thus any change in it would cause the whole day up to that point to change. If you had this problem you'd see all points for the day at the same value. It was fixed in 4.5, but you would have to completely rebuild the chart in 4.5 or the problem would carry over. If you don't have that problem either, then send us your chart and we'll take a look.

Maciej, Strategist, and Matt,

Thank you for your ideas.

I have checked, and I don't have any "lead" formulas.

However, I will check about the conditional since I do have some if-then formulas in some of my charts. I will search, and let you know later. However, this has happened in some of the charts where I am almost 99% sure no conditionals have been entered.

In addition, I have been careful not to use "lead" formulas, and formulas marked as not to be used for predictions.

I was wondering if there could be any other reason that I might have these kind of signals.

In any case, I am most grateful for the ideas.

Regards,

Sunny

> I had the same very problem. If you are using more than one datastream in your calculations, chances are this is the problem. To troubleshoot, I recommend you use "Insert Existing Data/Calculations" to plot anything containing the second data stream. Every time you plot a calculation, an underlying calc becomes available. If you follow this through, by the time you plot the second data stream you will see that when used in intraday setting it will have only one value per day - the value of the daily close. Hence in-range you will be trying to predict (for instance) intraday S&P while knowing Nasdaq close for the day. You will also get out-of-range results that are too good to be true. This will be a result of future data "seeping through" into the past. That is why your signals change in real time - "close" for the day on the second data stream is changing, and so is your "past" data.

For instance, when trying to calculate ratio between SPY and QQQ (QQQ being the secondary instrument), QQQ's last price of the day will be used for calculation throughout that day. To the extent that the day's last price is not available, it will use last bar's price for calculations throughout that day. That is why predictions are unstable in real-time – upon receiving a new bar, NS Trader goes back and changes all of the day's prices for QQQ to be equal to the last bar. As the last bar's price changes, so do the prices for all the day's bars, and that triggers continuous changes of predictions.

More on bizarro

Date :6/12/2004 6:23:26 PM Poster : John Gotwals

I have been following the bizarro discussion and tended to write it off as a delayed April fool's joke. However, I have been paper trading two models since the beginning of May, and something has arisen which appears to fit the bizarro classification.

One model uses a ClusterC3 indicator and the other uses a Recur3C. Both models have the same inputs and are optimized for the exchange traded funds DIA, QQQ, and SPY. The trading strategy has rules which restrict the number of trades to one trade per day per issue. The open position can occur anytime after the market opens and the positions are all closed at 3:55 PM.

The Cluster model gives moderate results for DIA and SPY and breaks even for QQQ. The Recur model give moderate results for both QQQ and SPY. However, for DIA the Recur model is consistently wrong. Not 100% wrong, but for the five week period the weekly totals are always negative. In fact if the trade opposite to the Recur3C model prediction had been taken for DIA, the six week return would have been twice as high as the best prediction from the nonbizarro cases.

I presume this could be a statistical fluke, but these results are from the last 28 trading days. I will be interested in your comments.

> >
> > Q: "would it (not) follow..but lose money" A: Straight models often lose money, in my experience. I see it this way: The genetic algorithm picks a point in modelling space where a certain model has done exceptionally well for a long time, due to the definition of fitness. This may have a corollary effect that there is a depleted area of points around this sweet spot which are unusually deficient in longevity, because a market behavior shift in any dimension/direction leads to a dropoff in longevity property. Therefore the best models fail sooner "making up" for their recent artificially sustained success. The cause of this may be due to some traders trading against patterns they noticed from the big program traders (who use optimised models), or it may be just a statistical property.
> >
> > Q: "Would it not also mean....losing money to bizarro modelers? A: First I do not think that there are many bizarro modelers. But I think the "straight modellers" are trying so stubbornly to create forever-lasting models that there may be some market inefficiencies (opportunities) created artificially. I would agree they are likely losing money to traders using a different strategy from following one optimized model at a time.

Re: More on bizarro

Date :6/18/2004 1:09:08 PM Poster : Steve Ward

I think you've got yourself a Bizarro model. Recur3 may be fitting more tightly than the other models, or maybe the DJ is just too different. You may or may not have to retrain it frequently so it stays wrong.

On 6/12/2004 6:23:26 PM John Gotwals wrote:

One model uses a ClusterC3 indicator and the other uses a Recur3C. Both models have the same inputs and are optimized for the exchange traded funds DIA, QQQ, and SPY. The trading strategy has rules which restrict the number of trades to one trade per day per issue. The open position can occur anytime after the market opens and the positions are all closed at 3:55 PM.

The Cluster model gives moderate results for DIA and SPY and breaks even for QQQ. The Recur model give moderate results for both QQQ and SPY. However, for DIA the Recur model is consistently wrong. Not 100% wrong, but for the five week period the weekly totals are always negative. In fact if the trade opposite to the Recur3C model prediction had been taken for DIA, the six week return would have been twice as high as the best prediction from the nonbizarro cases.

I presume this could be a statistical fluke, but these results are from the last 28 trading days. I will be interested in your comments.

Forum Search-- Out of Disk space

Date :6/19/2004 3:21:39 PM Poster : Steve Eberbach

I have tried to use the forum search, and keep getting a message about ODBC not enough disk space. Is the disk really that full??

Re: Forum Search-- Out of Disk space

Date :6/21/2004 10:43:07 AM Poster : Ward.net Webmaster

Should be fixed now - thanks for letting us know.

Applying 'Threshold' filter to a Prediction Signal

Date :6/25/2004 7:08:08 PM Poster : James Siebert

Greetings,

I've been trying to build a Trading Strategy based on a Prediction Signal series
which slowly oscillates around the zero line.

I found that many times the Prediction Signal barely crosses the zero line, and then moves back in the next day or two, generating unnecessary Entry Trades (or or early Exit Trades).

My idea to solve this was to create Threshold Indicators, which would require the Signal to "reach a minimum level" before Activating a Trade Signal, for example:

"Long Threshold" Indicator: Mult2(1* 0.18)

Long Trade Signal: If Prediction Value >= "Long Threshold" then 1 else 0

and a similar indicator for "Short Threshold": Mult2(1* -0.25) with is used in
Short Trade Signal: If Prediction Value <= "Short Threshold" then 1 else 0

This accomplishes my goal of only using "strong" Prediction Signals in the Trading Strategy, and filtering out the weak cross-back signals.

==> the Problem is: that to adjust my minimum Threshold Values (say adjust Long Threshold from 0.18 to 0.15) I can not just change it in one place, like the "Long Threshold" Indicator, but instead have to find every place this Indicator was referenced and then individually overwrite each 0.18 Value with my new 0.15 test Value. This become problematic especially if I've used this Value in multiple Predictors and Indicators.

Question: Is there any way to define and set a Variable such as this, so that it need only be changed in one place, ie. where it was first defined, and have that change apply automatically in all the places it is referenced, like a normal programming Variable?

Thanks in advance for any ideas

Re: Applying 'Threshold' filter to a Prediction Signal

Date :6/27/2004 10:39:13 PM Poster : Steve Eberbach

Under "New and Updated Examples" on this web page is tucked away a set of "Threshold Indicators"you can download and install. You can choose your logic (cross over a level up or down to signal, or set indicator continuously true over or under a level. Choose your level(s) and save your custom indicator(s) with the name(s) of your choosing.

Date :6/28/2004 9:27:30 AM Poster : Maxwell Craven

I don't know about a variable but here are two additional ideas:
1. Let the optimizer find the threshold.
2. Use the Fuzzy Sets plugin instead of a threshold.

I have had some pretty decent results using method 2.

James,

There is no global variable available to accomplish this for you. Instead and I agree that at best its a partial solution, you can do two things. Save your indicfators which will allow you to have a common variable within the indicators and then within the trading strategy use variables for those values that you need to have the same. A third step would be to save as a template the trading strategy your completed system.
This unfortunately is the nearest that I have been able to get in having a common value across the board.

Date :8/25/2004 12:32:39 PM Poster : James Siebert

Thanks for the suggestions, all.

I've started to use PowerBasic to program my own Indicators;
This seems to have the potential for managing global variables;

however testing and debugging DLLs is proving challenging in some cases.

thanks again for the replies

Re: Applying 'Threshold' filter to a Prediction Signal

Date :7/7/2004 1:10:31 PM Poster : Maxwell Craven

Instead of using a threshold like the wizard uses, I just put the net signal into a trading strategy and then go long or short when the signal is "high" or "low" or whatever. The optimizer usually does a good job there.

In search of a RELIABLE real time provider

Date :7/1/2004 10:36:41 AM Poster : Mickaël from Paris

Hi,
As a new user of N.S daytrader, I would like to tell you how much I'm very proud to integrate the ward gang familly.
I've been daytrading ONLY futures contracts (SP 500, E-Mini, Dow-mini, currencies contracts.. etc...) and I 'm looking for a RELIABLE real time data provider.
Is anybody help me to choose between e-signal and Prophet ?
Thank you

In search of a RELIABLE real time data provider

Date :7/1/2004 2:25:17 PM Poster : Mickaël from Paris

hi,
New user, I would like to tell you how much I' m happy and proud to integrate the Ward gang family.
I've been ONLY daytrading futur contracts on the CME and CBOT market (SP 500, E-Mini, Dow Mini, Currencies ..etc..). So I'm looking for a RELIABLE real time data provider. E-signal 7.6 seems to get some connection issues or anything like that.
Could anybody give me some informations about Prophet ?
- Is it a trully reliable data provider ?
- Is Prophet fully compatible with NeuroShell daytrader 4.5 ?

Thanks for your help.

Mickaël from Paris

You should test Prophet thoroughly with NSDT before switching. I'm using Prophet as a back up for daily bars but I've found some issues in earlier versions of NSDT with Prophet especially when running multiple instances of NSDT on the same machine. Of the three interfaces into NSDT that I have tried, quote.com is probably the slickest followed by Esignal and then Prophet. All of them provide the symbols that you are working.

I am currently using Prophet data, but I would only use it to trade stocks. I get very strange data with futures, such as negative numbers (works but inverts the graph). Also numbers greater then 100 have been truncated to two digits (actually in hindsight I wonder if the problem is with NeuroShell, but it still worked with Esignal). I am currently using to develop a system, but I plan on switching back to Esignal once I feel comfortable with my trading system.

The advantage of esignal is that they have CONTINUOUS emini contracts, which I don't think the others have (although I may be wrong). Continuous contracts are very helpful in NSDTP. Release 7.5 works well for me, and I've also tried the beta of 7.7 and esignal seems to have fixed the bug in 7.6, because the beta worked without any problems.

How is NeuroShell tested?

Date :7/4/2004 2:10:30 PM Poster : Alan Rhodes

What type of testing does Ward Systems do to make sure NeuroShell is accurate?

I am amazed at how complicated NeuroShell trader is, and I actually worry if my results are accurate. I have worked in the past in software testing, and took a course on that in college. But I do not have the expertise to double check results.

Re: How is NeuroShell tested?

Date :7/13/2004 2:50:20 PM Poster : Ward.net Webmaster

Major releases (like 4.0 and 5.0) are first tested by our programmers for as many as 6-12 months. Then the rest of the company tests for about 2-6 months, then beta testers get it for between 2 and 6 months. For minor releases (like 4.5) , the programmers test for a month or two, then the rest of Ward Systems tests for between 1 and 5 weeks, then selected users with problems fixed by the release get it for a week or two, sometimes more. Of course most minor releases are just fix releases fixing the problems found in the last release, so in that sense there is continuous test and repair.

external DLLs

Date :7/13/2004 10:05:49 AM Poster : chachi

Am I missing something, or is one prohibited from passing non-numeric parameters to an external DLL, and if so, why ?

Re: external DLLs

Date :7/13/2004 2:54:57 PM Poster : Ward.net Webmaster

You aren't missing anything. There is no reason the DLL interface won't take non-numerics except that the capability was never programmed, probably because no need was seen at the time. It is now on our list to do. If your need is to pass ticker symbols for trading, then the new trading API due out in release 5.0 may obviate the need.

Re: external DLLs

Date :7/14/2004 7:14:20 AM Poster : chachi

Ok, I wrote an export DLL to pass chart values straight into Access tables and had wanted to pass as text the underlying commodity symbol and chartname, guess I'll hold off on that added functionality and stick with predefined numerics for now. Any chance that a function to return the filename of the underlying dataset for a chart (eg to ease the effort I described) could be added? At present I see no way at function/DLL level to ascertain what instrument/chart is loaded.

On a different note, there does not appear to be a function to return the present trailing stop. If one has a parabolic stop and a trailing % stop then obviously only the nearest is pertinent but I see no way to reference it without "recomputing" the pair of stops

Re: external DLLs

Date :7/14/2004 9:56:16 AM Poster : Ward.net Webmaster

The Trailing stops are listed in Existing Data/Calculations (either "Long Trailing Stop: Trading Strategy #X", or "Short Trailing Stop: Trading Stategy #X"). So you can send them to a DLL, or whatever you want.

Regarding determining ticker symbol, if you can put each stock in a different chart, there is no problem because then you can just use a numeric indicator = 1,2,3 etc. in each chart.

If there are multiple stocks in the same chart that won't work. The only work around we can think of so far for this case is an indicator called FirstDateLoadedValue, which returns the price on the very first bar in the chart. As long as that value stays the same and unique among your stocks, you could send that value to the DLL and do a lookup in the DLL. The indicator is in a chart in a tip called How to Build Hedging Trading Strategies.

Correct, at present one has to use an 'if' statement to deliver the present stoplevel to an external DLL (poor choice of wording in my post) I meant a singular stoplevel output which did not require IF/THEN logic on top.

Regarding symbol/workaround, the charts I refer to are continuous futures contracts which get rerolled if not every month then every two or three, so start value would not work.

LMK if you need another willing beta tester for v5 / API / etc ;)

Re: external DLLs

Date :7/15/2004 1:18:35 PM Poster : Ward.net Webmaster

Sorry, we're not understanding why an IF statement is required. The existing/data calculations we mentioned show level on our charts. Try it with example 5.

An IF is required to pass the current stoplevel as a single parameter since you have segregated the values as "Long Trailing Stop" and "Short Trailing Stop" ...

Prediction reliability

Date :7/21/2004 1:26:56 PM Poster : Kermit

I've been thinking about this for some time now, so will ask the question here. Getting a prediction for each period is not as important to me as having some indication of the reliability of that prediction. I know that I can run several nets and leave one input out for each net, but that does not seem to be ideal. I have been still running NS2 and using variable data selections to run nets - I usually run eight nets - and the variation between the nets gives me some indication of the consistency of the data through time. What I am wondering is if this would be feasable to do in the Trader? Once the inputs and parameters are found, it should be relatively easy to run a given number of nets using those inputs and parameters and simply leaving out parts of the data, or, better yet, weighting parts of the data differently for each net. Could it be as easy as duplicating "chunks" of the data, possibly changing values ever so slighlty, so that this weighting could "walk" through the data? When the nets are displayed, the variation should tell me something about how consistant the data is through time, shouldn't it? An indicator could do it without displaying the individual nets - just a measure of how correlated the nets are. What do you think about this, Steve? It would be easy then to let the Trader decide when to take trades based on a threshold of this correlation.

Re: Prediction reliability

Date :7/22/2004 9:22:55 AM Poster : Steve Ward

I think the proof is in the pudding. I've never been a fan of adding noise to financial data (which I think you are suggesting) because financial data is plenty noisy already. (Noise is a great technique when all your patterns with the same output look much the same, like if you are recognizing machine printed characters). However, I have always liked the panel of experts approach, as long as the panel does indeed have experts, if you follow my drift. So let us know how your panel works.

> That was just an idea about how the data might be weighted. Using NS2 does work for me, as I can vary the random data selection for the training/test sets for each of the eight or so nets that i train. This does seem to me to give me some indication if the current pattern is consistent through the data. In the Trader, would it be possible to somehow weight portions of the data - say, if I chose to run eight nets as a parameter, the "bulge" in the data would be one-eighth of the data that would move from the start of the data to the end of the data? The output of the indicator would just be the correlation of the eight nets. With simply a prediction, I don't have a good idea about whether the pattern the net is looking at is consistent or not - similar patterns could have wildly different outcomes, or - the targets could all be close to each other. I do something like this by leaving one of the inputs out at a time and looking at the nets, but I am just wondering if there might be a better way to indicate variability through the data instead of across the inputs. An example of this might be the summer weather markets in the grains. Patterns could look similar for all years up to when the weather gives some indication of what the summer will be. If the weather pattern is normal, the seasonal pattern will most often work. But every few years prices get wild. And I'm just looking for an indicator that might give some indication that the pattern currently being looked at could result in wildly different outcomes.

Optimal Walkforward graphics

Date :7/22/2004 4:52:13 PM Poster : Steve Eberbach

I want to compare on my chart the appearance of my prediction's Optimal
Walkforward segments, strung together, just like the out of sample walkforwards are shown on the chart, but preferably in a different color. I am also interested in comparing the equity graph of the optimal walkforwards to the out of sample walkforwards.

I guess these are in memory somewhere; I just have not found how to get at them.
DLL interface custom indicator?

Does anybody know how to do this?

How to trade the same day as the signal with day-data?

Date :7/24/2004 5:45:49 PM Poster : Rolf

In the Prediction Parameter on the Output sheet it is possible to give instructions when to make the buy/sell. If I have day-data and I want the buy/sell to be made the very SAME day the signal comes just before they close how can I simulate that and optimaize my parameters?

Rolf

Sounds like this feature would be a great addition in the next version of NeuroShell. MetaStock has this feature in the tester, and I found the results of testing with this very interesting.

1Hr -> 1Day compression choices?
Date :7/26/2004 6:20:44 PM Poster : denizen2

It appears that we are 'missing' any choices in the intra-data compression beyond the 1Hr interval. Almost anyone interested in any of the 24-hr (electronic) trading sessions (i.e., Forex, Globex) might really like to use 2hr, or 4hr intervals too. But that doesn't seem to be available right now. Can more bar-time-compression choices be add sometime soon? Anybody else want to see that too?

Re: 1Hr -> 1Day compression choices?
Date :8/8/2004 8:00:25 AM Poster : Ward.net Webmaster

In release 5.0 we are currently planning to have N hour, N minute, N second, N tick, and N volume bars ... although some combinations (i.e. 1 tick bar or 100 volume bars, or 1 second bars) will probably be pushing the boundaries of how fast the Trader can evaluate each bar.

Buying & Selling on orders only
Date :7/27/2004 9:13:22 AM Poster : usgvince

I would like to enter a stop limit order at the high for the last 20 days. This would be my buy signal only. I would like to exit the order by putting in a stop limit order at the high for the last 10 days.

I would use no other parameters. How would I do this?

Re: Buying & Selling on orders only
Date :7/28/2004 11:00:57 AM Poster : chachi

What you've asked for is:

Long Entry Signal: Price > Max(High,20) [Limit price = Max(High,20)]
Long Trailing Stop Signal: Price < Max(High,10)

But - this doesn't make any sense since "entry day" must be a new 20d high and therefore must also be a new 10d high, so the next down tick you're always out ...

(?)

Using current net signals as inputs?
Date :7/28/2004 9:36:40 AM Poster : Strategist

I have created a nested prediction using the current net signal of other three predictions as inputs. I used the current net signal instead of out of sample signal in order to have a longer training sample available.
The out of sample results were too good to be true, therefore I suspect the current net signal is in-sample and my nested prediction has simply curve-fitted. I tried to plot current net signals and out of sample signals (as I was able to do with previous versions of NST) but I was not able to find them among the indicators. The on-line help did not explain much on this matter.
So my question is: how to know if -and how much- current net signals are out of sample?

Re: Using current net signals as inputs?
Date :7/28/2004 4:27:32 PM Poster : Matt Jarvis

My understanding is that current net signals are IN sample. They are from the training set of the most recently trained network.

S & P
Date :7/31/2004 5:46:24 PM Poster : bcar215

In an older version of Nueroshell (Mid 90's) some inputs were suggested in predicting the S & P. The S & P earnings and dividends, T-Bills, GDP, Etc.

Is it possible to make thie prediction with the recent uodated NS Trader by using these inputs.

Thanks, Bill

Re: S & P
Date :8/2/2004 1:08:10 PM Poster : Ward.net Webmaster

Those are primarily fundamental indicators. Since fundamental indicators (except those divided by price) only change on average every quarter, they are not appropriate for NeuroShell Trader, which uses primarily technical indicators on at most a monthly basis. Furthermore, fundamental indicators are better for longer term investing than shorter term trading. You are probably thinking about NeuroShell 2. Its successor, the NeuroShell Classifier, is a much better vehicle for investing longer term with fundamentals. However, using it will require a bit of work in collecting fundamemental data.

Here is a reference for a model using fundamental data:

"A New Technique for Tactical Asset Allocation"
Sorensen, Mezrich, and Miller all of Salomon Brothers
This was a chapter in the following book:
"Active Equity Portfolio Management" edited by Frank Fabozzi

A few years ago I was able to replicate the model and extend it for a few years after the authors work. The model made decisions monthly. The model did not use neural net technology but it is possible that neural net technology would work just fine. The authors described their variables completely, so you have something to start from.

I stopped following the model in mid 1999 after it went to cash and stayed there. Now, in hindsight, this was not a bad call for fundamental data based model.

Bugs, enhancements, new features, books

Date :8/10/2004 3:35:30 PM Poster : Sunny

I heard that a new revision of the program is due. I, therefore, took the liberty of adding some ideas.

First, I have found that while doing a trading strategy I am allowed to enter a stop price and limit price. However, if a few days later I want to revise the formula in the stop-limit price box, I am not given the choice to do this like in other parts of the program, and I am, therefore, forced to start from scratch with a new trading strategy.

Second, I would like to see more digits (at least four) added to the output shown under R-squared and correlation after completing a prediction. The three digits shown are not sufficient most of the time.

Third, I would like the program to do two simple and separate optimizations. For the first one, I would like the program to optimize the time frame to be predicted. In other words how many periods ahead work best. This could be turned on or off with a check box. As for the second optimization , I would like the program to choose from among a select group, the best output to predict. Both of these features would be MAJOR time savers. I think predictions would take longer; however, I would imagine that other users are also trying to optimize both of these choices manually, and in the end everyone could have a longer cup of coffee, and the program could do what it is supposed to do best, and at the end of the coffee break we could find a list of performed predictions from which to choose.

Fourth, on a separate note, I have been doing many predictions with no optimization, and sometimes I get some nice results; however, if I choose to search for the best parameters and/or rules, the program is not able to reproduce the nice results I got, and instead it shows negative results. I have been wondering if this could be due to the way the search engine goes about its work. If my presumption is correct, then maybe the prediction with no optimization should be the one chosen by the optimizer.

Fifth, I think that it would be very useful if the program could do a prediction of the start, end, initial direction, reverse direction, and number of reverses that the current bar might have. Currently the program allows us to do a horizontal prediction (across time); however, it does not have the ability to do a vertical prediction (in the current bar). I believe other users would find this useful. In addition, I don't think other programs allow this. This would be very useful since the program (or desktop computers) cannot handle the tick timeframe. This could serve as a substitute for the lack of this time frame in the program.

Sixth, I would also like to see with each prediction a confidence level both for the current bar and for past bars. I do not think that all predictions have the same confidence level for each bar (regardless of the timeframe). Moreover, this information could be added to the predictions or to the trading strategy in order not to enter or exit the market when the confidence level is below a certain level.

Finally, I would like to see a well written book explaining all the features of the program as well as advanced uses of the same -- recipes, ideas, formulas, suggestions, uses and creations by others, etc.

Sunny

Regarding your third suggestion you can have it now. Take a look at the Turboprop2 plugin. I purchased it for the ability to optimize those factors you mentioned, and others including training set and neurons. I probably could have programmed it myself, but for the price it wasn't worth it.

Most recommended goal

Date :8/11/2004 12:06:05 PM Poster : Phil Greenwood

When you choose the neural network training goal, there is a "Most recommended goal" at the top of the list, even above the default recommended goal. The "MRG" is #winners - #losers - which is all very interesting, but I can't for the life me figure out why this is such a highly recommended goal! Perhaps someone could fill me in?

Thanks,
Phil Greenwood

Re: Most recommended goal

Date :8/11/2004 3:42:03 PM Poster : Ward.net Webmaster

During our tests some time ago, we felt that one gave slightly more reliable results GOING FORWARD than the others. But we couldn't test everything, and it is only a recommendation to get new users started (the usual question of new users is "Which one should I use?"). Try them all. If something else works better for you or your trading style, then by all means use it.

Finding Elliott waves and other chart patterns

Date :8/11/2004 12:23:04 PM Poster : Phil Greenwood

I know that I'm not supposed to "covet my neighbours financial models", but I'm interested to hear anyone's experiences in scanning for chart patterns. I'm looking for impulsive Elliott waves...to a non-Elliottician, that translates to finding set-ups for price change surges - though I guess I'm would also admit that I'm working on the arbitrary assumption that there is a chart price pattern that would signal it.

I've recently acquired the fuzzy pattern plug-in, but the limitations of setting fixed segment durations seem to make it inappropriate, because I need to map patterns between swing-points. However, the issue is bigger than this, because it seems that any fixed pattern size would detect an arbtirarily small number of compliant set-ups in other types of patterns such as cup and handles, pennants, flags head-and-shoulders etc. Suggestions of how to counter this issue are most welcome...

Perhaps there's a mental back-flip I need to do to understand how to use this plug-in effectively?

Thanks for your help.
Phil Greenwood

Re: Finding Elliott waves and other chart patterns

64-bit platform

Date :8/11/2004 2:16:25 PM Poster : Sunny

While I am on the go with enhancements, I thought worth while asking for the ability to run NeuroShell with the coming release by Intel and Microsoft next year on a 64-bit platform.

Re: 64-bit platform

Date :8/27/2004 2:58:52 PM Poster : denizen

I second that 'wish'! But we need a lot more than 64bit computing. Everyday, I am in need of more computing power, but unfortunetely NST software is not currently able to take advantage of multiple processors on the same machine. So, I would suggest that before we could really take advantage of 64bit platforms, NST software needs to be 're-designed' to use multiple-processing (and/or multiple thread technology).

As part of that kind of performance enhancement (re-design), more attention should also be focused on keeping the user interface 'alive' and not 'shut out' while in some long processing loop. I.e., the Hour-glass icon should almost never be seen while optimization is going on, and/or the chart is being 'updated'. All of these long-processing functions should be done in a manner that just 'spawns' another 'background' process, while leaving the user-interface always ready for the next user-interaction.

This issue becomes very important when working with short time frames (5min or less) in very active markets (like Forex Euro/Dollar).

I have seen at least one other neural net software vendor that is offering multiple COMPUTER-processing via your local network connections! Now that approach really makes scaled increases in extra hardware-power! I imagine that most traders have at least two or three computers under their desk, so if we could tap all of those to do the work of long-optimizations, then it would probably out perform anything that 64bit computing might offer on a single machine.I hope Ward System will give this issue some serious consideration for a future release. They could even justify charging more for that kind of enhancement, in my view its ok.

Any comments on this from anybody?

Re: 64-bit platform

Date :8/27/2004 3:26:22 PM Poster : Ward.net Webmaster

We are definitely giving multiple processors across a network serious consideration, and we agree that it is more important than 64 bit processing.

eSignal 7.7 release candidate

Date :8/11/2004 3:14:50 PM Poster : Ward.net Webmaster

If you are an eSignal user of NeuroShell, we'd appreciate it if you would download the eSignal release candidate 7.7 asap and try it. You will find it about the middle of this page:

http://www.esignal.com/download/

This is especially important if you were unable to run 7.6 and had to go back to 7.5. Remember to bring up eSignal once before trying to connect with NeuroShell. Also remember to uninstall 7.5 or 7.6 before installing 7.7. Report any probelms or successes to us at support@wardsystems.com.

Thanks

Randomisation, calculation sequence and rate of change goal

Date :8/15/2004 2:48:41 PM Poster : Phil Greenwood

I've been trying to conduct a few studies on trailing stops optimisation recently, and I've come up with a few questions that don't seem to be addressed in the documentation:

1) I've been using a random function to try to eliminate the need for an entry strategy, which might skew the results. In theory, therefore, my results will probably be different each time I run the GA on the strategy. But they're not! It provides exactly the same trades every time - which means that either the GA is absolutely awesome, or the random function isn't "randomized" each run. Which is it? And if it's not random, how can I randomize it?

2) Because of inside days it's possible for a bar to be both a short term swing high and a short term swing low...so I need to know: Is there an order in which the trading strategy is evaluated?

3) This may be a simple question to answer: Are strategies evaluated from oldest bar first to newest bar?

Finally, on a slightly different subject - rate of change:

4) I want to use the GA to find fuzzy patterns that yeild rapid price changes (I mentioned this in an earlier post on Elliott waves). Is there a method by which I can set an objective of a rapid price change, such net profit / time in market?

Many thanks,

Phil Greenwood

Re: Randomisation, calculation sequence and rate of change goal

Date :8/16/2004 11:32:43 AM Poster : Ward.net Webmaster

Phil,

1) When we first introduced Random it used a new seed each time the chart was brought up, making it really random. The complaints started coming in because people couldn't see the same thing they saw yesterday. So we changed it. Perhaps we see now we have to give people both capabilities.

2) We look for longs first, then shorts.

3) Yes, oldest to newest.

4) You can try "Average Bar Profit" i.e. Profit/# Bars traded or "Average Trade Profit" i.e. Profit/# Trades

On 8/15/2004 2:48:41 PM Phil Greenwood wrote:
I've been trying to conduct a few studies on trailing stops optimisation recently, and I've come up with a few questions that don't seem to be addressed in the documentation:

1) I've been using a random function to try to eliminate the need for an entry strategy, which might skew the results. In theory, therefore, my results will probably be different each time I run the GA on the strategy. But they're not! It provides exactly the same trades every time - which means that either the GA is absolutely awesome, or the random function isn't "randomized" each run. Which is it? And if it's not random, how can I randomize it?

2) Because of inside days it's possible for a bar to be both a short term swing high and a short term swing low...so I need to know: Is there an order in which the trading strategy is evaluated?

3) This may be a simple question to answer: Are strategies evaluated from oldest bar first to newest bar?

Trading Strategy - Post Optimisation Analysis

Date :8/20/2004 11:43:16 AM Poster : John Hegarty

Having built my trading strategy and optimised it is there any way that I can get a detailed trading analysis, starting from zero, from the point at which the testing completed i.e first trading strategy signal, generated by new market data generates the first trade in the trading strategy's analysis.

I do prreciate that the Alerst widow does give this to a degree - but I much prefere the detailed analysis that is available from a tested strategy

Similarly could say the Netprofit indicator be reset to zero and restarted?

Re: Trading Strategy - Post Optimisation Analysis

Date :8/20/2004 4:46:38 PM Poster : Ward.net Webmaster

There's a tip on this site called "Adjusting the Start Date of a Trading Strategy" that should help you with that.

On 8/20/2004 11:43:16 AM John Hegarty wrote:

cant delete example templates or data

Date :8/24/2004 11:38:21 AM Poster : frustrated

every time I delete the data servers and example charts etc and restart,
they get reinstalled. How can I stop this from happening and get rid of them once and for all.

Re: cant delete example templates or data

Date :8/24/2004 2:07:28 PM Poster : Ward.net Webmaster

The Windows installer is trying to protect NeuroShell. If you cut off vital parts so that it couldn't come up, you would like that even less. Admittedly the example charts aren't that vital, but they are also very small. If you are trying to get more space on your hard disk, we submit the NeuroShell examples and data are dwarfed by temp files that Windows and Internet Explorer are hoarding. Get a Windows expert to help you kill them and you'll find plenty of space. You can also kill data and charts that YOU have added since installation, and that stuff can sometimes add up too.

ADX Indicator

Date :8/27/2004 1:30:53 PM Poster : usgvince

The ADX indicator is part of the price momentum indicators. But where are the -DI and the +DI indicators stored. Are you calling -DI and +DI indicators different names.

Re: ADX Indicator

Date :8/27/2004 3:29:33 PM Poster : Ward.net Webmaster

There are buried inside. However, we brought them out when we did Advanced Indicator Set 2 with the other Wilder indicators, like Parabolic SAR.

On 8/27/2004 1:30:53 PM usgvince wrote:

Walk Forward Training

Date :8/28/2004 9:13:23 PM Poster : Steve Eberbach

As an aside, I also would really like to be able to farm out processing to other CPUs on my network, for NST. I have been working this software out harder than any other program I have, except Windows itself.

I noticed that Generalize on Optimal Walkforward actually trains faster....

I believe that what I want from NST, besides realtime signals, is a simulation of what would have happened had I bought this software ten years ago, and used it all this time to trade. (given the method I use now, and guaranteed no "future leaks" from the algorithms.

To me, the ability to "walk forward" is tied in very tightly to this ideal. (but it has proven to be very tricky indeed)

So I have a complex question that everybody might like to know the answer to.

What I want to understand better is what is the difference between using the Turboprop2 addon in combination with the Trading Strategy Wizard, and using the Prediction Wizard using Generalize on Optimal Walkforward. (aside from the obvious greater flexibility in choosing trading rules in the Trading Strategy Wizard.)

The Documentation online says that Generalize in the PW saves the best out of sample walkforwards found by the PW. I would think that if the TP2 or ANI are used with the trading strategy, the lookahead in both, and the lookahead and retrain frequency parameter in TP2 could simulate, and even improve on the "Generalize" in Prediction Wizard. As I see it the Trading Strategy Wizard can average the WalkForward result of the ANI or TS2 indicators, and do one more big walkforward for testing. Somewhere I think I read in a tip about difference between Prediction Wizard and TP2 addon that future leak was better dealt with in TP2, because PW does not keep the small number of bars "not realizable in real time" in training OUT of all walkforwarding, while TP2 does.

But, I do not really understand well enough to my own satisfaction, if these can be truly equivalent, because I do not know how these algorithms are really working, internally. For example is Generalize working independently on each walkforward, or is it saving a best average?

But, what would be sufficient for my own use, would be to know exactly how to duplicate the procedure of Generalize on Optimal Walkforward in the Prediction Wizard, using just TP2 and the Trading Strategy Wizard, as a starting point. Lets say I start with Prediction Wizard with Generalize on Optimal Walkforward, limiting my inputs to 6 inputs. I pick the chosen best six input candidates and put these into TP2 with the same walkforward and retrain frequency, and a simple Trading Strategy like that of the Prediction Wizard. Will my results be the same?
If so, then I can try improvements from there, right??

So many times I get great results only to find I made a mistake with the PW leaving some of those bars in, or ANI using a future-derived target, and they gave me false hopes which died on further careful testing.
If this story sounds familiar to anybody, I would like to hear your experiences.

Also, I would like to see something more written to clarify this issue. I realize it will be a lot of work, and am willing to contribute some help.

Steve

Re: Walk Forward Training

Date :8/30/2004 3:59:22 PM Poster : Steve Ward

I think the best start here is to better explain Generalize on Optimal Walkforwards. This algorithm does what most of you probably do anyway. It peeks at some evaluation sets as the optimizer is building different nets, then it keeps the one that worked best "out-of-sample" so to speak. That's what you do if you build a net, then see how it did, then build another, etc., until you finally keep the one that did the best out-of-sample.

Now the evaluation sets it is peeking at are not the regular walk forward evaluation sets; they are older ones added especially for this purpose. So that way the usual walk forwards are still really out of sample. The down side is that the addition of the optimal walk forwards means your training data is a lot older. To bypass that protection and use more recent data (and to make the process really what you are probably doing already) you can set no walk forwards, as we described in the tip called "Using Generalize on optimal walk forwards".

The whole process described above happens only once because optimization happens only once, not on every walk forward. There can be many evaluation sets that are being peeked at, however.

I know it is a difficult concept, but if you set no walk forwards, only optimal walk forwards, you can then think of it as keeping the model that works best out of sample, not the one that works best in-sample. In release 5.0, the process will probably be much simplified, I hope, because I think it is powerful.

I see where you are going with AT2. That net is never showing in-sample results at all. Therefore, optimization is always optimizing the out-of-sample results. If you additionally hold out some data beyond optimization data, you still have true out-of-sample results, so yes I agree it is very similar. But I don't think you will get exactly the same results. I built AT2 because I found it more natural to use the automatic WF, plus I got the benefits of optimizing things like hidden neurons and training set size, even the output! On top of that, you can optimize it in a trading strategy with rules, other nets, stops, etc. If we'd have had AT2 before the first version of NeuroShell Trader came out, AT2 would probably have been the method in the Prediction Wizard. It may yet be some day.

Re: Walk Forward Training

Date :8/31/2004 12:35:07 PM Poster : Steve Eberbach

I am sorry I called AT2 TP2. I don't mean to add confusion, I am trying to clear it up.
I hope people don't mind my repetitive efforts to clarify this walkforward stuff.
It is so complex to me I guess its best if I work on a few bits at a time.

So here goes with a few more questions on Steve Ward's explanations.

Paragraph 1: peeks at some evaluation sets--- are these what is now called "optimal walkforwards"?

...keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is thisbest net selection done one walkforward at a time?

Paragraph 2: "regular" walk forwards are the last ones not called "optimal walkforwards", right? You might call them "optimal", and "out of sample" walkforwards, right? But really, all the walkforwards are trained with the same inputs and parameter selections made by one iteration of the genetic algorithm (in the pro version), and what is different is that the "turbo" predictor is focussing more on fitting the input set to the target in the "generalize on (optimal) walkforwards data occurring in the WF period just after the "training data" being used by the neural net. Right?

But is it true that if you do NOT select generalize on optimal walkforwards, while the nets may train longer than what it takes for best NET generalization in relation to least error fitting their assigned target ("actual"), still the genetic algorithm selecting inputs and parameters is using the optimal walkforwards to pick the inputs and parameters which generalize best in the walkforward periods in the set of evaluation sets you call "optimal walkforwards", isn't it?

So would a correct explanation be something like this:

The prediction wizard uses two optimization techniques simultaneously, an "inner" (loop) optimization which uses a neural net to fit a set of inputs to a target (called "actual"), and an "outer" optimization, in the pro traders, which further selects the best choice of inputs and optionally, their parameters, for each pass of the retraining through all the walkforwards up to the end of the "optimal walkforwards" training period, and just evaluates the retrainings for a selected number of walkforwards thereafter. (for your inspection of what would have occurred if you used your net for trading, and retrained that net periodically for some out of sample walkforward inspections of how you would have done had you kept that same net going for a while with the same inputs and parameters)

There are two kinds of walkforwards in the Prediction Wizard: optimal, which are used to select inputs and parameters via a genetic algorithm, and optionally selecting nets best fitting the actual target just after the training interval, and regular, which are a truly out of sample set of retrainings of the neural net based on the same previously selected set of inputs, parameters, and target time series to be "predicted".

When you turn on Generalize on optimal walkforward, on each pass trying a new set of inputs and parameters, the turbo-prop net which best fit the target, or actual, in the WFperiods called optimal walkforwards, is the net which is saved. But, this net still is retrained using the same inputs and parameters on each walkforward, optimal or regular.

Would it be clearer to call them "calibration walkforwards", and "out of sample walkforwards"?

Paragraph 4: "When you select no walkforwards"--- Do you really mean "When you select no out of sample walkforwards"?

And back to paragraph 2: " means your training data is a lot older...." Isn' "training data" all data NOT "out of sample"? You mean in this case part of the training data, the more recent in-sample data is used for the "calibration part" of training the turbo-prop nets, and only the earlier data is being used in iterating the neural network convergence to best fitting the "actual".

I guess that's enough for now. Maybe I'll try to explain in my own words the addons later after I get the Prediction Wizard right. Please help me get my explanations right, if they are not right so far.

On 8/30/2004 3:59:22 PM Steve Ward wrote:

Re: Walk Forward Training

Date :9/1/2004 4:30:29 PM Poster : Steve Ward

I'd say you have it right! Now if anyone complains when we simplify the prediction wizard in release 5.0 they are going to have to prove they understand all of this before I'll have sympathy.

On 8/31/2004 12:35:07 PM Steve Eberbach wrote:
I am sorry I called AT2 TP2. I don't mean to add confusion, I am trying to clear it up.
I hope people don't mind my repetitive efforts to clarify this walkforward stuff.
It is so complex to me I guess its best if I work on a few bits at a time.

So here goes with a few more questions on Steve Ward's explanations.

Paragraph 1: peeks at some evaluation sets--- are these what is now called "optimal walkforwards"?

...keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is thisbest net selection done one walkforward at a time?

Paragraph 2: "regular" walk forwards are the last ones not called "optimal walkforwards", right? You might call them "optimal", and "out of sample" walkforwards, right? But really, all the walkforwards are trained with the same inputs and parameter selections made by one iteration of the genetic algorithm (in the pro version), and what is different is that the "turbo" predictor is focussing more on fitting the input set to the target in the "generalize on (optimal) walkforwards data occurring in the WF period just after the "training data" being used by the neural net. Right?

But is it true that if you do NOT select generalize on optimal walkforwards, while the nets may train longer than what it takes for best NET generalization in relation to least error fitting their assigned target ("actual"), still the genetic algorithm selecting inputs and parameters is using the optimal walkforwards to pick the inputs and parameters which generalize best in the walkforward periods in the set of evaluation sets you call "optimal walkforwards", isn't it?

So would a correct explanation be something like this:

The prediction wizard uses two optimization.techniques simultaneously, an "inner" (loop) optimization which uses a neural net to fit a set of inputs to a target (called "actual"), and an "outer" optimization, in the pro traders, which further selects the best choice of inputs and optionally, their parameters, for each pass of the retraining through all the walkforwards up to the end of the "optimal walkforwards" training period, and just evaluates the retrainings for a selected number of walkforwards thereafter. (for your inspection of what would have occurred if you used your net for trading, and retrained that net periodically for some out of sample walkforward inspections of how you would have done had you kept that same net going for a while with the same inputs and parameters)

There are two kinds of walkforwards in the Prediction Wizard: optimal, which are used to select inputs and parameters via a genetic algorithm, and optionally selecting nets best fitting the actual target just after the training interval, and regular, which are a truly out of sample set of retrainings of the neural net based on the same previously selected set of inputs, parameters, and target time series to be "predicted".

When you turn on Generalize on optimal walkforward, on each pass trying a new set of inputs and parameters, the turbo-prop net which best fit the target, or actual, in the WFperiods called optimal walkforwards, is the net which is saved. But, this net still is retrained using the same inputs and parameters on each walkforward, optimal or regular.

Would it be clearer to call them "calibration walkforwards", and "out of sample walkforwards"?

Paragraph 4: "When you select no walkforwards"--- Do you really mean "When you select no out of sample walkforwards"?

And back to paragraph 2: " means your training data is a lot older...." Isn' "training data" all data NOT "out of sample"? You mean in this case part of the training data, the more recent in-sample data is used for the "calibration part" of training the turbo-prop nets, and only the earlier data is being used in iterating the neural network convergence to best fitting the "actual".

I guess that's enough for now. Maybe I'll try to explain in my own words the addons later after I get the Prediction Wizard right. Please help me get my explanations right, if they are not right so far.

I noticed that Generalize on Optimal Walkforward actually trains faster....

I believe that what I want from NST, besides realtime signals, is a simulation of what would have happened had I bought this software ten years ago, and used it all this time to trade. (given the method I use now, and guaranteed no "future leaks" from the algorithms.

To me, the ability to "walk forward" is tied in very tightly to this ideal. (but it has proven to be very tricky indeed)

So I have a complex question that everybody might like to know the answer to.

What I want to understand better is what is the difference between using the Turboprop2 addon in combination with the Trading Strategy Wizard, and using the Prediction Wizard using Generalize on Optimal Walkforward. (aside from the obvious greater flexibility in choosing trading rules in the Trading Strategy Wizard.)

The Documentation online says that Generalize in the PW saves the best out of sample walkforwards found by the PW. I would think that if the TP2 or ANI are used with the trading strategy, the lookahead in both, and the lookahead and retrain frequency parameter in TP2 could simulate, and even improve on the "Generalize" in Prediction Wizard. As I see it the Trading Strategy Wizard can average the WalkForward result of the ANI or TS2 indicators, and do one more big walkforward for testing. Somewhere I think I read in a tip about difference between Prediction Wizard and TP2 addon that future leak was better dealt with in TP2, because PW does not keep the small number of bars "not realizable in real time" in training OUT of all walkforwarding, while TP2 does.

But, I do not really understand well enough to my own satisfaction, if these can be truly equivalent, because I do not know how these algorithms are really working, internally. For example is Generalize working independently on each walkforward, or is it saving a best average?

But, what would be sufficient for my own use, would be to know exactly how to duplicate the procedure of Generalize on Optimal Walkforward in the Prediction Wizard, using just TP2 and the Trading Strategy Wizard, as a starting point. Lets say I start with Prediction Wizard with Generalize on Optimal Walkforward, limiting my inputs to 6 inputs. I pick the chosen best six input candidates and put these into TP2 with the same walkforward and retrain frequency, and a simple Trading Strategy like that of the Prediction Wizard. Will my results be the same?
If so, then I can try improvements from there, right??

So many times I get great results only to find I made a mistake with the PW leaving some of those bars in, or ANI using a future-derived target, and they gave me false hopes which died on further careful testing.
If this story sounds familiar to anybody, I would like to hear your experiences.

Also, I would like to see something more written to clarify this issue. I realize it will be a lot of work, and am willing to contribute some help.

Steve

Re: Walk Forward Training

Date :9/1/2004 6:12:17 PM Poster : Steve Eberbach

Thanks for the pat on the back for my efforts, but I'm afraid I still have not earned your sympathy. I still don't understand all this.

Quote from previous post:
"..keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is this best net selection done one walkforward at a time?"

This was a question, not an attempt to explain! It seems that here is yet another feedback loop. I think I got the other two, but this one is still not clear to me.
With the answer to this question, I can try to make a drawing called "How the Prediction Wizard Works" with comments and arrows.

Steve

I am sorry I called AT2 TP2. I don't mean to add confusion, I am trying to clear it up.
I hope people don't mind my repetitive efforts to clarify this walkforward stuff.
It is so complex to me I guess its best if I work on a few bits at a time.

So here goes with a few more questions on Steve Ward's explanations.

Paragraph 1: peeks at some evaluation sets--- are these what is now called "optimal walkforwards"?

...keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is thisbest net selection done one walkforward at a time?

Paragraph 2: "regular" walk forwards are the last ones not called "optimal walkforwards", right? You might call them "optimal", and "out of sample" walkforwards, right? But really, all the walkforwards are trained with the same inputs and parameter selections made by one iteration of the genetic algorithm (in the pro version), and what is different is that the "turbo" predictor is focussing more on fitting the input set to the target in the "generalize on (optimal) walkforwards data occurring in the WF period just after the "training data" being used by the neural net. Right?

But is it true that if you do NOT select generalize on optimal walkforwards, while the nets may train longer than what it takes for best NET generalization in relation to least error fitting their assigned target ("actual"), still the genetic algorithm selecting inputs and parameters is using the optimal walkforwards to pick the inputs and parameters which generalize best in the walkforward periods in the set of evaluation sets you call "optimal walkforwards", isn't it?

So would a correct explanation be something like this:

The prediction wizard uses two optimization.techniques simultaneously, an "inner" (loop) optimization which uses a neural net to fit a set of inputs to a target (called "actual"), and an "outer" optimization, in the pro traders, which further selects the best choice of inputs and optionally, their parameters, for each pass of the retraining through all the walkforwards up to the end of the "optimal walkforwards" training period, and just evaluates the retrainings for a selected number of walkforwards thereafter. (for your inspection of what would have occurred if you used your net for trading, and retrained that net periodically for some out of sample walkforward inspections of how you would have done had you kept that same net going for a while with the same inputs and parameters)

There are two kinds of walkforwards in the Prediction Wizard: optimal, which are used to select inputs and parameters via a genetic algorithm, and optionally selecting nets best fitting the actual target just after the training interval, and regular, which are a truly out of sample set of retrainings of the neural net based on the same previously selected set of inputs, parameters, and target time series to be "predicted".

When you turn on Generalize on optimal walkforward, on each pass trying a new set of inputs and parameters, the turbo-prop net which best fit the target, or actual, in the WFperiods called optimal walkforwards, is the net which is saved. But, this net still is retrained using the same inputs and parameters on each walkforward, optimal or regular.

Would it be clearer to call them "calibration walkforwards", and "out of sample walkforwards"?

Paragraph 4: "When you select no walkforwards"--- Do you really mean "When you select no out of sample walkforwards"?

And back to paragraph 2: " means your training data is a lot older...." Isn' "training data" all data NOT "out of sample"? You mean in this case part of the training data, the more recent in-sample data is used for the "calibration part" of training the turbo-prop nets, and only the earlier data is being used in iterating the neural network convergence to best fitting the "actual".

I guess that's enough for now. Maybe I'll try to explain in my own words the addons later after I get the Prediction Wizard right. Please help me get my explanations right, if they are not right so far.

On 8/30/2004 3:59:22 PM Steve Ward wrote:
I think the best start here is to better explain Generalize on Optimal Walkforwards. This algorithm does what most of you probably do anyway. It peeks at some evaluation sets as the optimizer is building different nets, then it keeps the one that worked best "out-of-sample" so to speak. That's what you do if you build a net, then see how it did, then build another, etc., until you finally keep the one that did the best out-of-sample.

Now the evaluation sets it is peeking at are not the regular walk forward evaluation sets; they are older ones added especially for this purpose. So that way the usual walk forwards are still really out of sample. The down side is that the addition of the optimal walk forwards means your training data is a lot older. To bypass that protection and use more recent data (and to make the process really what you are probably doing already) you can set no walk forwards, as we described in the tip called "Using Generalize on optimal walk forwards".

The whole process described above happens only once because optimization happens only once, not on every walk forward. There can be many evaluation sets that are being peeked at, however.

I know it is a difficult concept, but if you set no walk forwards, only optimal walk forwards, you can then think of it as keeping the model that works best out of sample, not the one that works best in-sample. In release 5.0, the process will probably be much simplifed, I hope, because I think it is powerful.

I see where you are going with AT2. That net is never showing in-sample results at all. Therefore, optimization is always optimizing the out-of-sample results. If you additionally hold out some data beyond optimization data, you still have true out-of-sample results, so yes I agree it is very similar. But I don't think you will get exactly the same results. I built AT2 because I found it more natural to use the automatic WF, plus I got the benefits of optimizing things like hidden neurons and training set size, even the output! On top of that, you can optimize it in a trading strategy with rules, other nets, stops, etc. If we'd have had AT2 before the first version of NeuroShell Trader came out, AT2 would probably have been the method in the Prediction Wizard. It may yet be some day.

Re: Walk Forward Training

Date :9/3/2004 9:44:06 AM Poster : Steve Ward

Here's how it works. The GA is finding input combinations. Each such combination is used on the training set to train the net. Then that net gets applied to the first optimal wf evaluation, then the net is retrained on the same input combination and applied to the next optimal wf evaluation, etc, until all optimal wf evaluations are finished. The input combination which produced the most profit (or whatever the objective function is) on all the optimal walkforwards as a complete trading sequence is remembered. Then after the GA is totally done that remembered input combination is used to retrain the nets for the regular walkforward evaluations.

Now the difference between "Generalize" on optimal walkforwards and the "normal" use of optimal walkforwards is subtle, because in both cases the inputs that worked best on the optimal walkforwards are the ones that are kept for later. The difference is in what the GA uses as a fitness function to improve itself. In "normal" use the GA is seeking the best performance on optimal walkforwards. In "Generalize" the GA is seeking the best performance on the original first training set. Therefore, the Generalize version is only rated on how well it works out of sample. The normal version is evolved to work well out of sample. In both cases, the out of sample set is compromised, but the normal version compromises it more. But since both compromise it, that is why we added the additional optimal walkforwards and kept the real walkforwards pure.

Re: Walk Forward Training

Date :9/3/2004 4:14:34 PM Poster : Steve Eberbach

Your most recent explanation helps me a lot. I think I get it now, but I need a wee clarification before I have earned your sympathy by proving I really "get it".

You wrote: In "normal" use the GA is seeking the best performance on optimal walkforwards. In "Generalize" the GA is seeking the best performance on the original first training set.

Do you mean: .....in "Generalize, the GA is seeking the best performance of all the optimal walkforward evaluation sets combined using only the original first training set to train the network?

In other words, is Generalize using a once-trained first net and one long out of sample "walkforward" evaluation instead of many smaller frequently retrained ones, then for out of sample evaluations, resuming the shorter retrain-walkforward sequence?

I interpret it that way, because the dates on the Prediction Analysis Reports show "optimal", and the subsequent "walkforward #x" selected in the "Network" column of the training results window to be dated this way.

On 9/3/2004 9:44:06 AM Steve Ward wrote:

So that way the usual walk forwards are still really out of sample. The down side is that the addition of the optimal walk forwards means your training data is a lot older. To bypass that protection and use more recent data (and to make the process really what you are probably doing already) you can set no walk forwards, as we described in the tip called "Using Generalize on optimal walk forwards".

The whole process described above happens only once because optimization happens only once, not on every walk forward. There can be many evaluation sets that are being peeked at, however.

I know it is a difficult concept, but if you set no walk forwards, only optimal walk forwards, you can then think of it as keeping the model that works best out of sample, not the one that works best in-sample. In release 5.0, the process will probably be much simplifed, I hope, because I think it is powerful.

I see where you are going with AT2. That net is never showing in-sample results at all. Therefore, optimization is always optimizing the out-of-sample results. If you additionally hold out some data beyond optimization data, you still have true out-of-sample results, so yes I agree it is very similar. But I don't think you will get exactly the same results. I built AT2 because I found it more natural to use the automatic WF, plus I got the benefits of optimizing things like hidden neurons and training set size, even the output! On top of that, you can optimize it in a trading strategy with rules, other nets, stops, etc. If we'd have had AT2 before the first version of NeuroShell Trader came out, AT2 would probably have been the method in the Prediction Wizard. It may yet be some day.

On 8/28/2004 9:13:23 PM Steve Eberbach wrote:
As an aside, I also would really like to be able to farm out processing to other CPUs on my network, for NST. I have been working this software out harder than any other program I have, except Windows itself.

I believe that what I want from NST, besides realtime signals, is a simulation of what would have happened had I bought this software ten years ago, and used it all this time to trade. (given the method I use now, and guaranteed no "future leaks" from the algorithms.

To me, the ability to "walk forward" is tied in very tightly to this ideal. (but it has proven to be very tricky indeed)

So I have a complex question that everybody might like to know the answer to.

What I want to understand better is what is the difference between using the Turboprop2 addon in combination with the Trading Strategy Wizard, and using the Prediction Wizard using Generalize on Optimal Walkforward. (aside from the obvious greater flexibility in choosing trading rules in the Trading Strategy Wizard.)

The Documentation online says that Generalize in the PW saves the best out of sample walkforwards found by the PW. I would think that if the TP2 or ANI are used with the trading strategy, the lookahead in both, and the lookahead and retrain frequency parameter in TP2 could simulate, and even improve on the "Generalize" in Prediction Wizard. As I see it the Trading Strategy Wizard can average the WalkForward result of the ANI or TS2 indicators, and do one more big walkforward for testing. Somewhere I think I read in a tip about difference between Prediction Wizard and TP2 addon that future leak was better dealt with in TP2, because PW does not keep the small number of bars "not realizable in real time" in training OUT of all walkforwarding, while TP2 does.

But, I do not really understand well enough to my own satisfaction, if these can be truly equivalent, because I do not know how these algorithms are really working, internally. For example is Generalize working independently on each walkforward, or is it saving a best average?

But, what would be sufficient for my own use, would be to know exactly how to duplicate the procedure of Generalize on Optimal Walkforward in the Prediction Wizard, using just TP2 and the Trading Strategy Wizard, as a starting point. Lets say I start with Prediction Wizard with Generalize on Optimal Walkforward, limiting my inputs to 6 inputs. I pick the chosen best six input candidates and put these into TP2 with the same walkforward and retrain frequency, and a simple Trading Strategy like that of the Prediction Wizard. Will my results be the same? If so, then I can try improvements from there, right??

So many times I get great results only to find I made a mistake with the PW leaving some of those bars in, or ANI using a future-derived target, and they gave me false hopes which died on further careful testing.
If this story sounds familiar to anybody, I would like to hear your experiences.

Also, I would like to see something more written to clarify this issue. I realize it will be a lot of work, and am willing to contribute some help.

Steve

Re: Walk Forward Training

Date :9/5/2004 8:17:03 AM Poster : Steve Ward

Yes, it is always using one long out of sample trading session from all optimal walk forwards. To clarify - you don't get my sympathy for understanding. You get my sympathy if you get upset about any future simplification of the Prediction Wizard. I figure only those who understand have a right to complain if and when we simplify things.

On 9/3/2004 4:14:34 PM Steve Eberbach wrote:
Your most recent explanation helps me a lot. I think I get it now, but I need a wee clarification before I have earned your sympathy by proving I really "get it".

You wrote: In "normal" use the GA is seeking the best performance on optimal walkforwards. In "Generalize" the GA is seeking the best performance on the original first training set.

Do you mean: .....in "Generalize, the GA is seeking the best performance of all the optimal walkforward evaluation sets combined using only the original first training set to train the network?

In other words, is Generalize using a once-trained first net and one long out of sample "walkforward" evaluation instead of many smaller frequently retrained ones, then for out of sample evaluations, resuming the shorter retrain-walkforward sequence?

I interpret it that way, because the dates on the Prediction Analysis Reports show "optimal", and the subsequent "walkforward #x" selected in the "Network" column of the training results window to be dated this way.

On 9/3/2004 9:44:06 AM Steve Ward wrote:
Here's how it works. The GA is finding input combinations. Each such combination is used on the training set to train the net. Then that net gets applied to the first optimal wf evaluation, then the net is retrained on the same input combination and applied to the next optimal wf evaluation, etc, until all optimal wf evaluations are finished. The input combination which produced the most profit (or whatever the objective function is) on all the optimal walkforwards as a complete trading sequence is remembered. Then after the GA is totally done that remembered input combination is used to retrain the nets for the regular walkforward evaluations.

Now the difference between "Generalize" on optimal walkforwards and the "normal" use of optimal walkforwards is subtle, because in both cases the inputs that worked best on the optimal walkforwards are the ones that are kept for later. The difference is in what the GA uses as a fitness function to improve itself. In "normal" use the GA is seeking the best performance on optimal walkforwards. In "Generalize" the GA is seeking the best performance on the original first training set. Therefore, the Generalize version is only rated on how well it works out of sample. The normal version is evolved to work well out of sample. In both cases, the out of sample set is compromised, but the normal version compromises it more. But since both compromise it, that is why we added the additional optimal walkforwards and kept the real walkforwards pure.

On 9/1/2004 6:12:17 PM Steve Eberbach wrote:
Thanks for the pat on the back for my efforts, but I'm afraid I still have not earned your sympathy. I still don't understand all this.

Quote from previous post:
"...keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is this best net selection done one walkforward at a time?"

This was a question, not an attempt to explain! It seems that here is yet another feedback loop. I think I got the other two, but this one is still not clear to me.
With the answer to this question, I can try to make a drawing called "How the Prediction Wizard Works" with comments and arrows.

I am sorry I called AT2 TP2. I don't mean to add confusion, I am trying to clear it up.
I hope people don't mind my repetitive efforts to clarify this walkforward stuff.
It is so complex to me I guess its best if I work on a few bits at a time.

So here goes with a few more questions on Steve Ward's explanations.

Paragraph 1: peeks at some evaluation sets--- are these what is now called "optimal walkforwards"?

...keeps the one that worked best--- is the "one" the whole summed up or averaged set of optimal walkforwards after one pass of retraining with a single selected set of inputs with a certain chosen set of parameters? Or is thisbest net selection done one walkforward at a time?

Paragraph 2: "regular" walk forwards are the last ones not called "optimal walkforwards", right? You might call them "optimal", and "out of sample" walkforwards, right? But really, all the walkforwards are trained with the same inputs and parameter selections made by one iteration of the genetic algorithm (in the pro version), and what is different is that the "turbo" predictor is focussing more on fitting the input set to the target in the "generalize on (optimal) walkforwards data occurring in the WF period just after the "training data" being used by the neural net. Right?

But is it true that if you do NOT select generalize on optimal walkforwards, while the nets may train longer than what it takes for best NET generalization in relation to least error fitting their assigned target ("actual"), still the genetic algorithm selecting inputs and parameters is using the optimal walkforwards to pick the inputs and parameters which generalize best in the walkforward periods in the set of evaluation sets you call "optimal walkforwards", isn't it?

So would a correct explanation be something like this:

The prediction wizard uses two optimization.techniques simultaneously, an "inner" (loop) optimization which uses a neural net to fit a set of inputs to a target (called "actual"), and an "outer" optimization, in the pro traders, which further selects the best choice of inputs and optionally, their parameters, for each pass of the retraining through all the walkforwards up to the end of the "optimal walkforwards" training period, and just evaluates the retrainings for a selected number of walkforwards thereafter. (for your inspection of what would have occurred if you used your net for trading, and retrained that net periodically for some out of sample walkforward inspections of how you would have done had you kept that same net going for a while with the same inputs and parameters)

There are two kinds of walkforwards in the Prediction Wizard: optimal, which are used to select inputs and parameters via a genetic algorithm, and optionally selecting nets best fitting the actual target just after the training interval, and regular, which are a truly out of sample set of retrainings of the neural net based on the same previously selected set of inputs, parameters, and target time series to be "predicted".

When you turn on Generalize on optimal walkforward, on each pass trying a new set of inputs and parameters, the turbo-prop net which best fit the target, or actual, in the WFperiods called optimal walkforwards, is the net which is saved. But, this net still is retrained using the same inputs and parameters on each walkforward, optimal or regular.

Would it be clearer to call them "calibration walkforwards", and "out of sample walkforwards"?

Paragraph 4: "When you select no walkforwards"--- Do you really mean "When you select no out of sample walkforwards"?

And back to paragraph 2: " means your training data is a lot older...." Isn' "training data" all data NOT "out of sample"? You mean in this case part of the training data, the more recent in-sample data is used for the "calibration part" of training the turbo-prop nets, and only the earlier data is being used in iterating the neural network convergence to best fitting the "actual".

I guess that's enough for now. Maybe I'll try to explain in my own words the addons later after I get the Prediction Wizard right. Please help me get my explanations right, if they are not right so far.

Re: Walk Forward Training

Date :9/5/2004 1:26:08 PM Poster : Steve Eberbach

Thanks, Steve!
What I am working up to next, as I asked you earlier on this thread, is to duplicate the Prediction Wizard with an AT2 combined with a Trading Strategy, and actually get the same results. If I succeed, then I will believe I understand it well enough. Call this a homework assignment to myself, to qualify me for Steve Ward's Certified NST Consultant Certificate. Seriously, I would like to see the Prediction Wizard simplified, but I want more power and flexibility, not less!!!!! So I want your sympathy now, before you finish rewriting the Prediction Wizard! I wish to participate in its improvement, so I do not "get upset" when you change it, but my suggestions would not mean much if the person(s) I am making suggestions to think that I don't even understand how Prediction Wizard works.

I noticed a post just today from a sophisticated user about the Prediction Wizard. One of his suggestions is one I was planning to write you about at a later time, that is, making it easier to freeze the parameters of selected inputs chosen during an optimization run. "Freezing" sub-models and keeping them in a list is the essence of the Group Method of Data Handling (GMDH) which you have implemented in your Neuroshell 2. It works even better in NST, but presently you have to do it manually.

This technique has not only doubled my scores, but has saved HUNDREDS of hours of computing time. As I work on a project, adding new ideas for indicators, each run starts with my best so far, and spends its training and searching efforts trying to break the old Champions' records. Great suggestion!!! And while it is a new feature, it is also a simplification! And my list of best "frozen inputs" is a great way to document my progress.

New Wish List for Improvements

Date :9/4/2004 2:41:42 PM Poster : denizen2

I have been using NST Pro extensively now for over a year, plus all of the Add-on modules. Here are some suggestions for what what I consider are the 'improvements' that I would most like to see in the 'near' future (ranked by priority, highest first):

(1) A 'new' Custom-DLL-API: MUST include STRING-type parameters (as well as the current numeric data types). Essential for exporting NST net/indicators to TradeStation via existing 3rd-party DLLs, plus input/output to/from MULTIPLE applications via GlobalVars and database type DLLs. Would also automatically make possible (via available 3rd-party DLLs: (a) multiple time-frame strategies, (b)automatic trade-execution (with complete trade/risk management user-interface too). I.e., a 'quantum jump' over current capabilities of NST to 'communicate' with external programs.

(2) Prediction Wizard: Add option for TWO 'levels' in the prediction 'model'. If a 'top'(i.e.,the output) level could be added, then the user could include, for example: (a)'smoothing' function, (b)a statistical function (e.g., ZScore), or (c) the new Fisher Transform function. The intention would be to provide one parameterized-function that applies to the net-output associated with ALL of the potential inputs. I currently have to achieve this combination in two separate steps, without the benefit of the GA operating on ALL parameters at the same time. It is an excellent 'solution' when dealing with excessive 'noise' in the output from a net, particularly by adding the FisherTransform (from the Cybernetics add-on) to the net output, and while being able to optimize both 'levels' at the same time.

(3) Prediction Wizard: Add option for 'trigger levels' to be treated in the same manner as done by the CrossAbove and CrossBelow indicators in the Strategy Wizard. The current approach to Predictions of Trades only provides the A>B type of RELATIVE-LEVEL, but not the more noise robust functionality provided by the cross-over functions. The Predictions models might be improved considerably by that simple addition?

(4) The Prediction Wizard (Display): The 'trade signals' are MISSING (i.e., not displayed) when the user has selected the "Other" category for the "Output". When the Output-choices include any of the given 'optimal BUY/SELL' type outputs, then the generated signals are automatically displayed. But when I create my own 'Objective' for the training, those signals are NEVER available or displayed. I have been able to create my own Objectives that are much better, giving me more 'consistent' and 'transparent' results. So I would appreciate if I could also generate and display the signals too. Can that be added?

(5) The Prediction Wizard (Display): Want control over the COLOR of the displayed "Out of Sample" and "Out of Sample Signal" lines. Currently the user has no way to change the color from the 'default' grey color. This makes it VERY difficult to display multiple versions of a function-approximation-prediction-net on the price chart and be able to identify them separately. I see no reason to restrict the color to only GREY.

(6) Deletions of Existing Nets: This is sometimes a VERY frustrating problem, because there is NO reference to what other indicator is still using the one marked to be deleted. Sometimes, I can spend considerable trial-and-error searching time trying to find it! Why isn't that information made available to the user at the time there is a 'complaint'. Also, I suspect there is a 'bug' that somehow allows the backward linking of items using a given item to be 'broken' without being properly and consistently counted. So we end up with a 'phatom link'. The use of the Position indicator may be one such area where it is possible to change the parameter in this indicator that points to a different Strategy, and then loose track of it when the 'old' Strategy is deleted. Need to show user ALL links that are 'attached', AND also allow a way to 'override' the 'check', if all else fails.

(7) Prediction and Strategy Optimization Options: Would like very much to have better (interactive) control of what indicators are part of each optimization run. I.E., Add check-box to each indicator in the list of 'inputs' that allows user to 'freeze' any changes to the LAST optimiztion run, while still allowing the remaining (unchecked) inputs to be optimized. This can only be achieved now by manually setting the min/max range to whateve the LAST value used. Very inconvenient. I get better models when I can 'participate', by 'seeing' the 'intermediate' results better. There is usually nothing really 'sacred' about the optimiztion-merit function choosen, so I might use this extra-interactive approach to try different training criteria while allowing only few changes in the input parameters, and with fewer intputs being temporily optimized the process is much faster.

> Item 5: Color display. If you select under "Options" to include all the signals and outputs of all your Prediction Wizard nets, and you display the Current Net, or other stored walkforward nets,
> you will find that all of it is "in sample", except for the net's response to inputs BEFORE and AFTER the training set, but you can change the color and line thickness by selecting the signal indicator and using the little selectors in the Tool Bar at the top of the chart window. While its nice to see the net's response over all the chart bars, I still cannot change the color of the signal outside the training set. But you can overlap these signal lines by dragging one indicator over another and see both insample and out of sample overlaid in the color and boldness of your choice.
>
> Item 4: When setting or modifying "Prediction Parameters", hit the tab "Output", and there is a little button just to the right of the listbox, when you have selected your own Objective for training ("actual", or "target"). You select your other objective by selecting the item at the bottom of the list called "(Other Data/Indicators)", and picking from the list. Clicking the button labeled " ..." lets you modify your chosen objective, and the modified version will appear in the list of existing and calculated data. Display this as an indicator, and drag it onto whatever other chart you wish to compare it with, such as network output.
>
> Item 3: This is a can of worms. I think you have a great idea here, but it leads on to more and more ideas.... A serious question to me is exactly how much like the trading Strategy Wizard should the Prediction Wizard be? Should it get simpler? More complex? Be integrated with the Trading Strategy Wizard? I have lots of ideas about this, but I am not quite sure where to start, as it would impact the whole interface design of NST.

> >
> > Item 4: The comments you made seem to imply you are only considering the case where the Prediction Wizard is used as a 'function approximation' for a given output or 'indicator', BUT not as a predictor of 'Trades Signals'. Specifically, if you go the 'Position' tab and select 'Both Long and Short' positions, instead of 'NO Position', then you would expect that the predicted trade signals would be displayed. But that sub-graph and/or main graph are empty of any trade signals. My point was that in the case of using any of the pre-defined 'trading' type objectives you will get the trading-signals displayed. This is something that I would suggest needs to be 'fixed', so user-defined objectives [for trading signals] are displayed the same as the predefined ones.

Title bar of Prediction Wizard Window shown while training

Date :9/4/2004 8:53:41 PM Poster : Steve Eberbach

I am doing a documented review of Prediction Wizard to better understand it, and write my personal add-on to the official documentation.

I noticed a small detail which needs correction: The Title Bar of the window displayed while training does not show the correct target: " [Trades, Predicted xxxxxxxxxxxxxxxxxxxx]" until the "finish" button is pressed once.
This occurs when experimenting with various settings within the Prediction Wizard without "finishing" and/or saving the chart.

I noticed this while trying various targets for the Prediction Wizard.

Re: Title bar of Prediction Wizard Window shown while training

Date :9/8/2004 10:53:44 PM Poster : denizen2

Yes, I have noticed the same behavior that you described (below). It is very confusing to have incorrect 'titles' being displayed. If you want to find some more 'confusing' behavior that really needs some attention, then also look at the Prediction Wizard window that list the inputs, and then expand each input to show the names of the parameters for that input. IF you have a complex input built up of several indicators, then you will find muliple parameter names that are probably the SAME name, and there is no reference made to which indicator each parameter is associated. This issue becomes very important when you are setting the optimization ranges for each parameter. So the user is stuck with guessing, or perhaps by deciphering the order of the parameters. I mention this not becaue it is a 'documentation' issue, but because it should also be 'fixed', just the same as the incorrect title issue should be fixed.

Wizard Design

Date :9/10/2004 11:27:13 AM Poster : Steve Eberbach

Since there are comments about an approaching update of the Prediction Wizard, I decided to submit my thoughts to the forum. This one is very important to me, and may help others using NST pro.

I was reading an interview with one of the "Real Traders" who trades Long positions only in his IRA. It struck me that a very simple change to the interface of both the Wizards for the next release would be very helpful.

In both wizards there is a dialog for setting longs, shorts, or both to be traded.

-- a dialog: "use the tabs below to specify rules for when to buy or sell" in the Trading Strategy Wizard, and a dialog: "Trading positions used to calculate statistics" in the Prediction wizard.

Why can't we take advangage of the ability now in NST to add several symbols to one chart, and make those three choices in the wizards be "Position A, Position B, or Both", instead of Long, Short, or Both?

In this case Position A could be Long "Symbol Top Symbol on chart"), and position B be Long symbol "XYZ". Instead of just selecting long or short as it is now, the alternatives would be 1: "long or short the default symbol" (only), 2:long or short another symbol (only, 3: Both 1 and 2.

Normally alternative one, two, three tabs or buttons, A, B, Both,would mean the same as in the present NST, the choices would would mean "trade long the default symbol only" , "trade short the default symbol only", and "trade both long and short the default symbol". What changes would only be that each tab or button could be set to read a long/short (choice of symbol), (one position or cash) or either of two positions (switch between choices). The systems would still retain the ability to be out of all positions and be in cash, as they do now, given the 4 decision thresholds available in the Wizards

The big difference is this would enable optimizing such IRA-useful strategies as, say, mutual fund or Sector Fund switching. I would hope this expands NST's potential market a lot!

Re: Wizard Design

Date :9/13/2004 4:37:41 PM Poster : Steve Eberbach

I have given many headaches' worth of thought to the idea of user fitness definition, and I think I see that the ability to program the function would be nice, but very hard for most people to get up to speed on. Also, the present definitions, (with a few additions) I think would be sufficient in themselves. What I REALLY want to do, and what I think is more in line with the NeuroShell Trader Pro design philosophy, is to specify, optionally, when a certain trading statistic is satisfactory to my trading expectations, and allocate any of the Genetic Algorithm's remaining effort to my NEXT priority, and so on.

The way NST is set up now is to set one criterion's goal to infinity or zero. The GA, being very obedient, will try to do that without consideration of anything else. Even optimizing one ratio or product is like throwing darts, or running a Soviet 5-year economic plan by specifying one goal.

So I see the interface for setting up fitness, particularly for the Prediction Wizard, which needs this badly, is to specify two or three criteria, from the existing list, and also specify what number Priority One should reach before the training switches to adding "score" to the Second and Third priority.

I think a such a prioritized tradeoff with all reachable objectives would be enough to get the GA to stop running off into Bizarro Land. Before, I used to think the best way would be a mixture of the objectives, together striving for infinity and beyond! But now I know better. As the effort made by the optimizer increases, you get to a point where out-of -Sample results are increasingly sacrificed for the sake of the greedy training and selection algorithm stuffing all the gold into the insample results. You have to STOP the algorithm before it gets to that point of RAPIDLY diminishing returns out of sample for gaining tiny further improvements in-sample, and switch to another goal which might be easily achievable, but cause less sacrifice in out of sample performance consistency.

Then I would combine several of these models which easily reach modest goals consistently into my final "Expert Trading Committee".

Re: Wizard Design

Date :9/29/2004 1:19:01 PM Poster : Steve Eberbach

I have some more comments on NST Wizard design, in an effort to help make NST easier to learn and use, with little as possible change to the features already in NST, but more emphasis on the way we access those features....

1. Being long or short one stock is like investing your money in two different
securities: Long Stock A or Short Stock A. You can just as easily switch your money between Long Stock A and Short Stock B. That way you could be more neutral with respect to changes in the broad Market. Why are the interfaces in NST not able to reflect the choice of any two positions, either in one security or two? The only difference should be that if you have at least two securities in your chart, you have the ability to choose which two you are trading between in the Trading Strategy. (or Prediction
Wizard)

2 I like the Dates dialog in the Trading Strategy Wizard: It makes sense to a
trader learning NST. It took me a while to realize it shows nearly the same
information as the Dates dialog in the Prediction Wizard: Most importantly, the Date seperating Optimizing by the Genetic Algorithm and Paper Trading (simulating out of sample results), the date of starting optimization, and the date ending it.

The main difference is that you have to count up days in the walkforwards to figure the dates out in the Prediction Wizard.

Why doesn't NST always start out with the Trading Strategy Wizard, and let you APPLY the Prediction Wizard, using only what more complexity is needed to add the Prediction(s) to the Trading Strategy? If you want to simply use non-trading objectives, like minimize errors, the trading checkboxes in your Strategy would reflect this by being turned off. If you checked them "on" you could see your signals and statistics as usual, except the G.A. would not be using the trades for optimizing.NST could even have a "Prediction Wizard" Trading Strategy Template, which does exactly what the Prediction Wizard does now. That would make it easier to learn and navigate the Prediction Wizard without changing its capability. I would prefer that the walkforwards be specified in terms of time span and step size seperately, so they could overlap, and even be different settings for the Optimise dates, or the Paper Trading Dates, (out of sample simulation). And why not call the Walkforwards Paper Trading Walkforwards instead of just Walkforwards? And Optimised Walkforwards, instead of "Optimal Walkforwards"?

The Dates dialog is so important IMHO, for understanding what NST is really doing, I think you should be able to view and set all the "dates" from it: Charting Beginning and End of loaded files, Frontier Date between Paper Trading and Optimising by the GA, and the Training and Evaluation data set structuring when using the Prediction Wizard and walkforwards. Having this all in one place instead of having to go looking for different parts would be a big help.

3. A couple of places in the interfaces of Version 4.5 there are lists of items to select from. The usability of the program would increase if there were some options, like radio buttons or checkboxes next to the items. I see three categories I think are most valuable.

A. Multiple securities in a chart: Select whether each security should be left alone or re-optimized (and included in the performance evaluation averages or not) when running the optimization, right by the name of the security in the dropdown listboxes. Maybe here you could select which charts to send to the trading strategies in the chart to implement the switching of capital between two (or two sets of) securities.

B. Multiple Rules in Trading Strategy: checkbox-"GA may Optimise Parameters"; and choice of: required rule (which GA may or may not optimize), excluded rule, or let optimizer choose rule whether or not the optimizer is allowed to change parameters. The advantage is faster experimenting without lots of typing, and the saving in plain view INSIDE your saved charts, of rules you might like to try again later, without having to print them out, or save many different versions of charts, to recall them once you have written them. This might also be easier to understand than the present dialog box choices you have to navigate away from the rules to see.

C. Parameters of Indicators optimizable by GA: Now you can set an input to fixed status (to save it) by opening the "plus" in the tree dialogs for inputs or outputs, and setting the minimum and maximum of each parameter to the same number.

Options settable there, like the Rules in Trading Strategy, would be very convenient for the user of NST: one checkbox- "GA may optimize" (if not checked, the parameter are "frozen" by being set to max=min) and option buttons for each input (not individual indicator parameters) to be: required, excluded, or available for choice by the optimiser. (R,X,C, labels or red,black,or green bullets with pulldown menu to change-whatever the
programmers think is cool). This could be done for the indicator in toto, without even clicking on the + symbol) or parameter-by-parameter, or both. The in toto version would work in NST Trader as well as Trader Pro.

Again this could help reduce typing, and help document the process of developing Trading Strategies and Predictions by letting you experiment without much typing, and "saving" in plain view your previous experiences as you progress in developing a chart.

And all this with minimal changing of the NST Wizard Design as it is now, mostly some simplifying and making it more flexible at the same time.
Denizen2, how would this help those items in your suggestion list?
Respectfully Submitted,
Steve Eberbach

I have given many headaches' worth of thought to the idea of user fitness definition, and I think I see that the ability to program the function would be nice, but very hard for most people to get up to speed on. Also, the present definitions, (with a few additions) I think would be sufficient in themselves. What I REALLY want to do, and what I think is more in line with the NeuroShell Trader Pro design philosophy, is to specify, optionally, when a certain trading statistic is satisfactory to my trading expectations, and allocate any of the Genetic Algorithm's remaining effort to my NEXT priority, and so on.

The way NST is set up now is to set one criterion's goal to infinity or zero. The GA, being very obedient, will try to do that without consideration of anything else. Even optimizing one ratio or product is like throwing darts, or running a Soviet 5-year economic plan by specifying one goal.

So I see the interface for setting up fitness, particularly for the Prediction Wizard, which needs this badly, is to specify two or three criteria, from the existing list, and also specify what number Priority One should reach before the training switches to adding "score" to the Second and Third priority.

I think a such a prioritized tradeoff with all reachable objectives would be enough to get the GA to stop running off into Bizarro Land. Before, I used to think the best way would be a mixture of the objectives, together striving for infinity and beyond! But now I know better. As the effort made by the optimizer increases, you get to a point where out-of -Sample results are increasingly sacrificed for the sake of the greedy training and selection algorithm stuffing all the gold into the insample results. You have to STOP the algorithm before it gets to that point of RAPIDLY diminishing returns out of sample for gaining tiny further improvements in-sample, and switch to another goal which might be easily achievable, but cause less sacrifice in out of sample performance consistency.

Then I would combine several of these models which easily reach modest goals consistently into my final "Expert Trading Committee".

On 9/10/2004 11:27:13 AM Steve Eberbach wrote:
Since there are comments about an approaching update of the Prediction Wizard, I decided to submit my thoughts to the forum. This one is very important to me, and may help others using NST pro.

I was reading an interview with one of the "Real Traders" who trades Long positions only in his IRA. It struck me that a very simple change to the interface of both the Wizards for the next release would be very helpful.

In both wizards there is a dialog for setting longs, shorts, or both to be traded.
-- a dialog: "use the tabs below to specify rules for when to buy or sell" in the Trading Strategy Wizard, and a dialog: "Trading positions used to calculate statistics" in the Prediction wizard.

Why can't we take advantage of the ability now in NST to add several symbols to one chart, and make those three choices in the wizards be "Position A, Position B, or Both", instead of Long, Short, or Both?

In this case Position A could be Long "Symbol Top Symbol on chart"), and position B be Long symbol "XYZ". Instead of just selecting long or short as it is now, the alternatives would be 1: "long or short the default symbol" (only), 2:long or short another symbol (only, 3: Both 1 and 2.

Normally alternative one, two, three tabs or buttons, A, B, Both,would mean the same as in the present NST, the choices would would mean "trade long the default symbol only" , "trade short the default symbol only", and "trade both long and short the default symbol". What changes would only be that each tab or button could be set to read a long/short (choice of symbol), (one position or cash) or either of two positions (switch between choices). The systems would still retain the ability to be out of all positions and be in cash, as they do now, given the 4 decision thresholds available in the Wizards

The big difference is this would enable optimizing such IRA-useful strategies as, say, mutual fund or Sector Fund switching. I would hope this expands NST's potential market a lot!

Steve

Wizard Design2-More Options Needed

Date :9/11/2004 11:30:21 AM Poster : denizen2

When using either the Prediction or Strategy Wizard, my 'standard' approach is to begin with the Input Options that specifies that ALL rules be selected & applied (optimizing only the parameter values). This presumes, of coarse, that I have some reason to believe that all the rules are 'probably' relevent. I have found that I get 'better' results doing this BEFORE selecting the option to optimize all the rules (and therefore use only a subset of the rules). This is especially true when some of the rules contain LEVEL threshold parameters, perhaps because it takes much longer for those kind of rules and might tend to be 'ruled out' more quickly than is really necessary. The current Wizard design accommodates this approach by allowing me to 'manually' do the optimization in two steps. Ok, so far.

However, I would ALSO like to be able to make that choice (i.e., optimization of only rule parameters, OR opt of rules and parameters) so that it applies to ONLY exits or entries rules. Currently, I have no way to specify the Inputs Options, separately, for the Exits and Entries rules. I believe this kind of design change could be implemented by just adding additional checkboxes on the existing tab. It would greatly benefit the users to have this additonal flexibility.

Can DLL access ...?

Date :9/20/2004 12:54:19 PM Poster : Philippe Lonjoux

Is there a way for a DLL (C) to access the number of bars as it was during the last optimization?
Could it be in the form of a detailed SDK parameter list or an external configuration file?

Thanks for your help.
Philippe

Re: Can DLL access ...?

Date :9/24/2004 9:03:25 AM Poster : Xprogrammer

Do you mean the number of bars that optimization was performed on? I don't know of any way, but if you mean the total number in the chart, then yes, you can pass that in as a parameter.

On 9/20/2004 12:54:19 PM Philippe Lonjoux wrote:

Re: Can DLL access ...? (One more item in wish list)

Date :9/24/2004 8:03:00 PM Poster : Philippe Lonjoux

Thanks Xprogrammer.
Yes indeed, this is what I meant. Somehow, this information is built into charts.
Now, I developed data-adaptive indicators with predictive skills that need to be assessed on "out of sample" rolling windows. The indicators though have to be fired on "in sample" data only.
Having a more complete SDK would certainly help unleashing the power of Neuroshell Trader and promote it further... One more virtue of componentwares.

DLLs

Date :9/23/2004 11:59:47 PM Poster : aaapers

Has anyone had any experience with a basic compiler from Europe called PureBasic. Apparently, it is a full compiler, it can do dlls and it is relatively cheap. I have been considering getting power basic. Any comments would be appreciated.

Re: DLLs

Date :9/24/2004 10:38:17 AM Poster : Steve Eberbach

I have Power Basic, and have tried many other Basics, too.
I also own Ibasic Pro, from Pyxia Development, which I believe is the best alternative in the low cost category. It is on my project list to write a template indicator DLL for NST using IBasic. Sorry, I don't have one ready to share yet, but if you get IBasic, you will be welcome to ask for my help on this. Pure Basic is OK, but I will not be using it, as I prefer IBasic. Check it out.

We have just checked out IBasic Pro and found that the DLLs run fine in NeuroShell Trader Pro and DayTrader Pro. We have also put up a code example on this site - look in the section New and Updated Examples. We think Steve is right, at $70 it is a very inexpensive and easy way to program NeuroShell enhancements.

Cyber indicators

Date :9/26/2004 8:56:55 AM Poster : Matt Jarvis

The Ehlers cyber indicators seem to produce some great signals on daily charts even without optimizing, but not as good on intraday charts. Anybody know how I can get 1 minute charts to work as well? (I trade futures so I don't like to stay in overnight).

Re: Cyber indicators

Date :9/27/2004 9:18:24 AM Poster : chris wong

try the stochastic rsi. it works well for me. i think ehlers may have been concentrating on daily charts in his book, but if you use the optimizer carefully the cyber indicators also do quite well intraday.

The problem is not with the Ehlers Indicators which are excellent - the problem is with the time frame. I have experimented a lot with 1 and 2 minute bars but there is so much noise (my term) that it is impossible for ANY indicators to get a handle on the movement. I think you have to work with at the very least 5 minute charts. Recently, following a tip from Support, I was able to adjust the output of a Cybase indicator on a 2 minute chart to correspond pretty accurately with its ouput on a 5 minute chart. You do this by plotting the indicator on a 5 minute chart and then exporting the data to your 2 minute chart. You then adjust the inputs of the same Indicator on the 2 minute chart to correspond.

Turtle trading

Date :9/27/2004 8:43:10 AM Poster : Wanttobea Turtle

Hi,

I'm new to trading strategies and I came across the orginal turtules trading strategy, I want to confirm if I'm on the right track, I list the turtle requirement and what I think the Neursoshell trading strategy should be:

* Turtle = Long Entry: Based on a 20-day breakout (todays close exceeding the high of the procedding 20-days
* Neuroshell = Long Entry: Trading wizard (+ High Channel Breakout(High price, Periods)...is this correct condition

* Turtle = Long trailing stop: Turtle stops were set at 2% below the entry for the long position.
* Neuroshell =LOng trailing stop: Tading wizard(+ Trailprice%(trading strategy, percent trailing.

* Turtle = Exit: was 1 a 10 day low for long postions
Neuroshell = Long exit (+Low channel Breakout(Low price, Periods)

Can somebody inform me me if I'm on the right road?

Cheers
Wanttobea Turtle

Re: Turtle trading

Date :9/28/2004 12:10:06 AM Poster : Maciej

You're on the right track. However you'll probably find that the approach won't be particularly profitable. For me, the real secret of the Turtles is not the entry techniques rather the money mangemet that was deployed. You'll find that implementing these in NSDT will be quite a challenge using the ATR indicator in your stops and exits.
Furthermore, the Turtles would pyramid in when the going was favourable (0.5 ATR from memory) so in NSDT you'll need several trading strategies each one dependant on the previous one - ie if already long and price moves in my favour by 0.5 ATR then enter another long and move the stops on both trades up by 0.5 ATR.
To complete the challenge, the Turtles used a method of normalising the size of a trade depending on how much capital was availble - both increasing and decreasing and also taking into account the volatility of the commodity in question - so the equivalent of one soybean contract could be say four corn contracts.
Finally the entries/exits could occur at any time during the session including the triggering of multiple entries, so if there were a sudden rise in a commodity during a session then the day could end up with several trades by session end. To simulate that I feel requires that you use intra-day data.

I'd be interested in seeing how you get on with this idea but this is an example of an approach to trading that's quite complex to simulate in NSDT even though the wrttent description of the process is quite straightforward. For what it is worth I don't know of any software where one could easily implement the whole Turtle approach. The challenge is worth pursuing as if you'll crack this you'll be able to use a sound money management technique that will allow you to replace the fairly crude initial entry techniques by others and get potentially even better results.

Lagged indicator question

Date :10/12/2004 6:40:38 PM Poster : Manny LaCarrubba

I'm new to neural networks and have a question regarding the use of lagged versions of an existing input as an addition input to the net. In my reading I note that this is not uncommon but, does it not simply duplicate data that has already been input? What is it about the way the net looks for patterns that make this technique useful? Would it not be more beneficial to use the difference between today's value and the value n days ago than simply using the value from n days ago? Thanks in advance for any information you can share.

Re: Lagged indicator question

Date :10/13/2004 11:08:08 PM Poster : Philippe Lonjoux

Let's assume that the stock market is a dynamical system. The time series you choose as input should be the outcome of all interacting processes that drive the price. It should contain information about the dynamics of all important variables involved. Fair enough.

In a more academic way, these variables satisfy a set of several first-order differential equations.

Now, it has been shown (Ruelle 1980) that a time series and its successive lagging copies is enough to fully describe the dynamics of the system. The shifting is equivalent to first-order differencing. Therefore, lagging versions of the initial input become additional variables.

The neural network then detects nonlinear relationships among these variables, and creates nonlinear approximations to the underlying generators of data. Here you go.

And as you suggest, your original input time series should be detrended. You will achieve much more accurate forecasts when using percent changes versus the actual closing value of stocks.

Re: Lagged indicator question

Date :10/14/2004 4:40:01 PM Poster : Manny LaCarrubba

Thanks for your comments. I was not referring to detrending here. I really meant a lag of either price, or some technical indicator that is being used as an input, as an additional input. This technique clearly duplicates data that is already being provided to the net. What is it about the way nets look for patterns that makes this useful?

Philippe, your comments regarding time series and their successive lagging copies being able to fully describe the dynamics of the system were most instructive. Thanks again. Clearly there is more going on, however, or forecasting would be very much easier than it is!

Re: Lagged indicator question

Date :10/15/2004 5:16:57 PM Poster : Steve Ward

Forecasting isn't hard except in the financial markets. It is hard there because it is extremely difficult to get inputs that actually affect the future (so called leading indicators). If you find them, they don't last more than a month or so because a lot of people find that they work, and the markets adapt. With regard to nets, you must be thinking that since they study hundreds of bars of inputs, that all previous bars are also in the input set, so to speak. Only the inputs of the current bar are used to make a forecast by "comparing" the current bars' inputs with the inputs of all bars that have been studied. Some nets, like our recurrent nets in our Neural Indicators addon, automatically feed into the inputs a historical "context", making lags less necessary. Our Adaptive Net Indicators addon has nets that automatically feed in a large number of lags. Unfortunately, however, the more inputs you feed a net (or any type of model really) the more you tend to overfit. You can actually get a great net just feeding in random numbers as the inputs if there are a lot of inputs. That net won't do well into the future, however. That is the main reason we suggest using only about 4 or 5 net inputs.

Thanks for your comments. I was not referring to detrending here. I really meant a lag of either price, or some technical indicator that is being used as an input, as an additional input. This technique clearly duplicates data that is already being provided to the net. What is it about the way nets look for patterns that makes this useful?

Philippe, your comments regarding time series and their successive lagging copies being able to fully describe the dynamics of the system were most instructive. Thanks again. Clearly there is more going on, however, or forecasting would be very much easier than it is!

Let's assume that the stock market is a dynamical system. The time series you choose as input should be the outcome of all interacting processes that drive the price. It should contain information about the dynamics of all important variables involved. Fair enough.

In a more academic way, these variables satisfy a set of several first-order differential equations.

Now, it has been shown (Ruelle 1980) that a time series and its successive lagging copies is enough to fully describe the dynamics of the system. The shifting is equivalent to first-order differencing. Therefore, lagging versions of the initial input become additional variables.

The neural network then detects nonlinear relationships among these variables, and creates nonlinear approximations to the underlying generators of data. Here you go.

And as you suggest, your original input time series should be detrended. You will achieve much more accurate forecasts when using percent changes versus the actual closing value of stocks.

I'm new to neural networks and have a question regarding the use of lagged versions of an existing input as an addition input to the net. In my reading I note that this is not uncommon but, does it not simply duplicate data that has already been input? What is it about the way the net looks for patterns that make this technique useful? Would it not be more beneficial to use the difference between today's value and the value n days ago than simply using the value from n days ago? Thanks in advance for any information you can share.

Re: Lagged indicator question

Date :10/15/2004 8:08:08 PM Poster : Manny LaCarrubba

Thank you Steve. I think I got it now.

On 10/15/2004 5:16:57 PM Steve Ward wrote:
Forecasting isn't hard except in the financial markets. It is hard there because it is extremely difficult to get inputs that actually affect the future (so called leading indicators). If you find them, they don't last more than a month or so because a lot of people find that they work, and the markets adapt. With regard to nets, you must be thinking that since they study hundreds of bars of inputs, that all previous bars are also in the input set, so to speak. Cost of Staying in Trade Overnight

Date :10/23/2004 6:05:05 PM Poster : Steve Eberbach

A feature I want to see added in ver 5.0 is the ability to specify the cost of staying in a trade overnight, usually expressed as a percentage, as is done for daytrading brokers.

The trading site "Dukascopy" http://www.dukascopy.com/english/welcome/ allows trading stocks in the same style as FOREX, specifying spread in "pips", or Percent points, using large leverage as is typical in FOREX.
This is an interesting and quite appealing alternative to the larger spreads and more complicated spread structure involved with using options, and is certainly easier to simulate in a computer for the purpose of deciding tradability.

Their commission is an entry spread percent charge, plus an overnight percent charge. These charges vary with the instrument traded.

If more brokerages move to this paradigm in the near future, and I'll bet it will happen soon, it would be cool to be able to simulate this in the costs dialog of NST.

Anybody else interested in this??? Please comment!

Steve,

Dukes looks like a variation on so called spread betting that's popular in the UK - another site is the CMC Deal4Free. The interest in these is essentially based on the level of spread - when a market is liquid their spread is small and therefore interesting. However this spread can become bigger than the cost of a contract say for the mini DJ as it becomes progressively less advantageous compared to a normal broker as you increase the bet size. Another reason for these types of sites' popularity is that for UK residents all gains are tax free which is not the case for normal brokers. The biggest issue with them from a NSDT perspective is the data can only be approximated as they do not provide data downloads of their bid / offer prices which in my experience are not a simple question of a couple of pips either side of a say Esignal price. Their spreads tend to be slanted against you depending which way they think the market is going so their use for day trading is not compelling.

Thanks for the other sites' names. I will check them out. Yes, the commission is quite steep, but I thought it much better than options, where open interest is only about 2000 to 10000 contracts maximum, and spreads run about a dollar per share.

I thought that by tracking their "valid price" to see what side of the bid/ask from Tradestation they are running, I could calculate their slippage and simulate it quite exactly. The only problem I have is the ten-second delay, which requires your trades be done in a quiet market. That is not a problem for me, since I avoid the situations where I risk a lot of bad fills.

I have written to them asking questions, but they have not responded. In particular, I asked if their realtime "valid-prices" are the prices I can execute, and if they are what they provide as historical data. They claim I can execute a fixed price in a ten-second window without change. So if my order transit is less than ten seconds, I get an exact fill, regardless of what the market does while my order is being transmitted. If their "valid price" hits my limits, my orders should execute. I should also be able to get market open and close minus their spread on the first side of the trade only, and exact fill on the exit. Their silence is not a good sign, but I still hope to learn more, since if this grows like the FOREX ads are growing in the magazines and press, this business model will be a retail brokerage competing ground due to the ease of normalizing various instruments to a common (standard) trading simulation model. Also I hate the execution of options in my experience, and would tolerate quite a large commission for a faster more liquid offering of leverage services on common stocks. The stock futures still seem a bit thin to me. Fifty pros all noticing my lonely little order, and competing to see if they can get my stop. I would prefer their making me an offer good for a time, and if I like it I can take it. I want to set up small portfolios which can be dynamically optimized. And if their computers are set up with a rigid trading model, their prices versus other quote sources might become a useful trading indicator.

Of course, if I hear reports from serious traders that they are a rigged scam house, I can spare myself the anguish of yet another what you see is not what you get. And I am fearful of them disappearing overnight, saying suddenly they are "under investigation, please be patient", meanwhile the phones are disconnected.

Steve, you want to compare with deal4free - their trading software is pretty neat, the charting less so. I always get the price quoted but you need to be pretty quick. Like I say the biggest issue is that their prices are "synthetic" with the spread slanted according to the way their software thinks the price is going so its dearer to buy in a rising market and dearer to sell in a falling market. I don't think its economic for anything but small position trades.
